Emery: And what happens is, when light hits it, it reflects the light that's around you, you know, that's in front of you. And it also . . . With the old suits, it would reflect basically what was behind you, because you wanted to stand up against something, and you want to see the chair. You don't want to see me.

But it wasn't very effective, but it's really good, of course, at night and it's good during the day if you're in some jungle warfare.

But it's not as good as the one in the movie, of course, . . .

David: Right.

Emery: . . . but it was darn good, and it saved a lot of people's lives. So that's what that is.

The upgrade from that is: let's get a suit that's better than Iron Man, but gives you mobility, so you don't ever have to take it off. You could wear it for seven days.

David: It cleans you?

Emery: Yes.

David: Wow!

Emery: So that was what they're doing . . . And gives you nutrients, at the same time.

David: You don't need to eat and drink?

Emery: You don't need to eat or drink because it goes through your skin, because they have now developed a way to have nutrients and water absorbed through the skin.

David: Do you have to kind of get past an initial hunger feeling to . . .

Emery: Well, everyone still, you know, eats and drinks, and stuff.

David: Oh, okay.

Emery: It's not like, you know . . . It's just for if you HAD to.

David: Okay.

Emery: You know, you wouldn't have to.

David: Right.

Emery: But, you know, the suit does have to be maintenanced, you know, like a jet. It's not like you can just wear it for a year.

And it's charged with a very special type of water that's charged, and that's how they do it. That's how it actually operates through this charged plasma.

David: Is there any little box or bump on it that's like . . .

Emery: Nothing. No, it's flawless, seamless.

David: Wow!

Emery: It does have like a Ziploc feature, like a suit would, when you get into it.

All suits are made specifically for the operator. It has to be, because it won't work correctly. You could actually . . . If you were to jump in my suit and then try to go do something, you could actually hurt yourself.

David: That makes sense.

Emery: So what they're trying to do now is make an all-in-one that contours. Like it has its own AI to know, “Oh, so anyone can use these suits.” So in the future, they'll probably have that.

And then there's a problem with the helmets that they're having with it, but I'm sure it's fixed by now.

David: Before we get to that, what could you tell us about things like, for example, running and jumping if you had the suit on? What would be different about that?

Emery: Well, you can run up to 38 miles an hour.

David: Wow!

Emery: And it won't let you fall. It's got a special system in it that . . . You have to

understand the suit has billions of these lines, these like, let's say, like dental floss lines in it. So each thing can tighten anywhere.

So if you did . . . You know, it absorbs every bullet that comes to you, you know. I mean, you're not bulletproof, but for the most part, it'll stop a 223, no problem.

David: Wow!

Emery: So what happens is it knows if you're getting wobbly and about to fall, and it'll put pressure on that, and that whole side of the suit will tighten to realign you so you can keep going.

David: Wow!

Emery: Because you can . . . It is made to actually run through any terrain, like very rocky terrain, and also carry a lot of weight with you.

David: Wow!

Emery: Yeah. So you could actually jump off a cliff, do a back flip – even though you're not a gymnast – and you will land on your feet like a cat.

David: Wow!

Emery: It will not allow you to land on your head or hurt yourself. And the suit will take over and, you know, curl you into a ball and make sure you're going to land on your feet. It's very interesting.

It also has little types of things that can project out. The suit can actually project out little fins and things on it for swimming, and also for when you . . . if you did mess up and you are actually jumping too high to change the way you're falling, in case you were unconscious, let's say.

David: So what about jumping in particular? Let's talk about jumping.

Emery: Jumping is amazing. I mean, you could jump, I think, up to around 50 feet . . .

David: Wow!

Emery: . . . 50, 55 feet from the ground with no pack, with no weight.

Weight is . . . If you have any little weight on you, it calibrates it and that does affect everything for the suit.

And the suit self-calibrates. It's reverse-engineered extraterrestrial technology that they use. It's definitely not something that we just thought of brilliantly and made.

So it is something that is using a lot of this other technology in it. It was developed only for like really, really upper-class, special-ops projects people, which has nothing to do with the government. I'm talking about a very higher level of, you know, things.

So now we have the opportunity to bring this to the world, without all the special features, but the protective features that we would like to give it to, of course, you know, start off with like the police officers and the firemen, and stuff, because it's amazing.

It can protect you from heat, of course, cold.

David: All right. Let's be a little more specific though.

Emery: Right.

David: When you say “we . . .

Emery: Right.

David: . . . could you be more specific about who is “we”? And how would this suit be able to get out to the public?

Emery: The people who have invented this suit, I'll just say, want to see it put to good use. And there's other, you know, types of these suits, of course, that can do other things that are, you know, war-like type things.

So instead of doing, you know, going that level . . . because these are prototypes, you have to understand. This is not available yet for any . . . you know, too many. So these are all prototypes.

So they're out there, you know, thinking, you know, what are they going to do with it?

The reason I got involved with it was because they needed a substance that I had, and it was: “If you could get us the substance for the suit, to make it levitate, then we can make a deal with you with the suit.

“We can give you your own suit, but you know, we have to, of course, keep the suit, but you can have it, you know, whenever you want. Of course, you can't, you know, go running around cities with it or show it off, but, you know, you can go to

undisclosed huge places out in the middle of nowhere in the United States and have, you know, do your own testing on it."

And that's what I wanted to do, because I knew the materials that it was made with – especially the helmet I was working with, which is completely separate from the suit, but it was going to be made for the suit.

You know, it was completely materials I knew were extraterrestrial origin that they just reverse-engineered.

David: You kind of quickly said something about it levitating.

Emery: Yes.

David: What does that mean exactly? How would it levitate?

Emery: Well, levitation on this suit would have to do with white gold.

David: Hm.

Emery: They needed the pure white gold from the ancient times.

David: Really?

Emery: Yes.

David: But what kind of levitation? Could you be more specific?

Emery: Well, the suit is consciousness assisted, so by mixing these properties of the suit with this special white gold, you'll be able to levitate. Yeah, you can actually levitate.

David: To how much of a degree?

Emery: As much as you want.

David: Really?

Emery: Yes.

David: Wow!

Emery: And if the suit was built correctly enough, you could go to space with it.

David: Well, it is strange, because occasionally, here and there, you get these stories sometimes – there was one in Australia recently of what appears to be a man levitating in the air.

Emery: Uh-huh.

David: You know, a human figure . . .

Emery: Oh, right.

David: . . . just levitating in the air. How many of these suits are out there for people to test?

Emery: There's only two . . . I only know of two suits.

David: Really?

Emery: Yeah. I only know of two suits of this . . . from this manufacturer. Yes.

I'm sure there's MANY other suits. I mean, I've seen many Iron Man-type things out there, you know, like real . . . that kind of thing, but not to . . . not like this.

David: Right.

Emery: Because this is beyond, you know, nuts and bolts.

David: Sure. And I want to point out that Corey Goode, when I brought this up to him, he said that they had this in his Secret Space Program, and he used them.

And he did say that there was a momentary type of anti-gravity, that if you fell for like the last two or three feet before you hit the ground, it had enough gas to kind of levitate you before you hit the ground, so you make a smoother landing, but it's only a short term, brief levitational capability.

Emery: Yeah, the suit for jumping and for landing, with the suits that I'm aware with, had none of that. It had . . . was using electromagnetic fields to do that.

David: Oh, really?

Emery: Yes.

David: And also, we've seen movies like “The Edge of Tomorrow”, the Tom Cruise film, “Live, Die, Repeat” . . .

. . . where he . . . the soldiers have these big bulk metallic chassis, . . .

Emery: Oh, right.

David: . . . and they can like move parked cars with them, and things like this.

Emery: Yes. That's very old school technology. It's used in every secret project. They're very common in underground bases.

David: Really?

Emery: Exoskeletons, like you saw in the movies – even in the "Alien" movies with Sigourney Weaver and stuff, those big ones.

David: Right.

Emery: They're much more smaller now. They contour to your body easier. They're very adjustable, and they're not as bulky.

And you can, you know, lift 10 times your own weight. You can lift . . . You're a human forklift is what it is.

David: Wow!

Emery: But you're not . . . It's not made for jumping, or acrobats, or, you know, running at high speeds, the ones that I'm aware of.

David: What could it do for you if you get a laceration or a broken bone, or something like that? Does it have any countermeasures for that?

Emery: Absolutely. The suit itself will contract on that to stop the bleeding and add an coagulating factor to that, built into the suit.

David: Wow!

Emery: Not only does it give you vitamins, minerals, electrolytes, nutrients, and other special proteins and amino acids, so you can communicate with the suit better, and the suit communicates with you, but it also can set your leg.

So leg breaks, that becomes now one solid piece.

David: Wow!

Emery: Yes. It's amazing.

David: What about the pain? Does it have . . .

Emery: Yeah, it can give pain if you direct it to give pain, or if there's also operator induced. You know, like if you have the satellite - of course, [it] comes with a satellite – and the satellite will know.

And someone usually is communicating with you from somewhere with it. You're never, you know, just running around, and this kind of thing.

And this is completely the prototype, by the way.

David: So what would happen if you're feeling a great deal of fear, anxiety? Would the suit know that you're afraid? Would it have any way to help you with that?

Emery: Yes, it measures pheromones and chemicals in your body, constantly. So it's a constant laboratory.

So it knows if your adrenaline goes up. It knows when your heart rate goes up. It knows . . . You know, it will analyze things.

And plus, don't forget, it's usually connected to also a team that's watching you, and they will take precautionary methods and may, you know, administer epinephrine, you know, or morphine, or you know, whatever it is you need to be extracted out of where you're at, if you were really that hurt.

David: Does it have any aromatherapy capability?

Emery: Not that I'm aware of. I don't remember seeing anything like that.

David: Okay.

Emery: I was not debriefed on that.

David: Well, it is interesting, because Corey's version of the suit is almost exactly the same as what you're saying.

One of the only things I remember HE said was that if you were upset, at certain times, it would give you a smell like lavender, or whatever smell you like, it can generate that for you.

Emery: Yeah, what it does, with this suit, is it doesn't use pharmaceuticals. It uses . . .

Your body has its own chemicals to deal with stress.

And what it does is why it's so important that each suit is made for you is because once we do get your blood test, we actually measure all those chemicals in there that, you know, actually initiate fight or flight movements.

So it could give you really quick some dopamine and serotonin, which is cool, though it's an autologous dopamine and serotonin.

And autologous means it comes from your own body. It's just concentrated.

So it has the ability to help you heal and cure you, and add your own chemicals that you would need to do that, so you wouldn't have to, you know, take anything else. Like it alleviates all that pharmaceutical-type stuff.

David: If this were to be distributed to the public, how would we prevent somebody from – essentially like a terrorist – to becoming an indestructible super villain by having a suit like . . .

I mean, I guess, other people with the suit could defeat somebody like that.

Emery: Yes, it's not . . .

David: How would you stop that from being misused?

Emery: Yeah. Well, that . . . You know, that's the whole thing. So I think that the slow release would be to like the police officers.

And plus, it would be downgraded to just do for what they needed. Bulletproof. They wouldn't get to jump. They wouldn't get to run as fast. They wouldn't have as many fibers in it. It wouldn't have all the nutrients and all that stuff.

It would probably have more stuff to protect the person – more of just a protective suit, but nothing else to be superhero-type thing, you know.

And that's kind of how they want to launch that for civilians. And then make a civilian one that helps with people that are sick or helps people that have dangerous jobs even . . .

David: Like a lifeguard.

Emery: Like a lifeguard, or welders, or, you know, people that deal in dangerous positions where they get burned.

David: Firemen.

Emery: Yeah, firemen, like we just talked about. And then, you know, that would trickle down to the future suits of just everyone being able to have one, you know, that it just kind of keeps you healthy and keeps you strong, and, you know, that kind of thing.

David: Is the production of something like this technology kind of similar to how our chips in our smartphones keep getting better and better, and, as they get better, then they're mass produced? And now it's not expensive anymore because we're making them.

Could the suits ultimately get to be consumer level price, do you think?

Emery: Oh, absolutely, but it wouldn't have all, you know . . . It would be limited with features. You know, it's all about that.

So, yeah, you wouldn't be able to get the X-phone 20, but you can get the X-phone 10 today.

David: Ha, ha, ha.

Emery: Inside joke. But yes, I mean, that's how it works.

I don't' think . . . By that time, I do believe that we won't need to do that. I think these things will be able to be handed out to everyone. I think that we're not going to . . . We're going to be moving away from this consumer thing pretty soon – in the future, I mean, within the next 20 years.

David: I wanted to not leave this unturned. You said there was a problem with the helmet. Could you describe what the problem is? Why wouldn't the helmet be good?

Emery: The helmet is amazing. The problem with the helmet is pressurization and communicating with the suit, since it was a different developer.

David: Oh.

Emery: It's just . . . The helmet works flawlessly. It's just it's not connecting to the suit correctly, because the suit is so perfectly sculpted to the body that the helmet is actually not, okay? So it's a little bit bulkier. Small – much smaller than a motorcycle helmet. Okay? And that's the problem, right now, they're having with that. But it's probably fixed by now. That was in . . . last summer. I mean, not last summer. That was the year before last.

David: So are we correct in saying that you have been given an opportunity to become a distributor for this as it rolls out to the public?

Emery: Yeah, more like a connector, I like to consider myself. I'm not so much on the business aspects of that stuff as I have so many other things going on.

But I would like to connect that, so it's, you know, put to good use to protect the people that are protecting us right now, you know, that are out there, such as the police officers, and the firemen, and the paramedics, and, you know, all of these other people in the civilian world, because, you know, it's getting kind of crazy out there, and they need some help.

They need to be a little bit more ahead of the game with these asymmetrical threats. And, you know, these things can, along with the helmets also, . . . There's no way something can sneak up on you, so . . .

David: I'm curious about things like international law and the United Nations, and how they might feel if a particular military gained access to this technology, and they would have such a disproportionate advantage in war that if the command structure of that country were to become compromised, they could enact some kind of global dictatorship of some kind.

Are there any thoughts about that?

Emery: Well, that's just an opinion, I would say. They didn't ever talk about . . . They don't talk about that stuff.

Manufacturers and inventors, and you know, politicians . . . or, I mean, not politicians, but the people that run those corporations, they do not, you know, think about long term.

They're more about who's going to, you know, pay the biggest money, and how they're going to do this, and we need that.

But luckily with this group, they're more compassionate, because they're, you know, . . . about it, because . . . I can't say any more about them, because I'll be . . . my . . . you know, I just can't talk about them personally.

And then, so, . . . but their heart's in the right spot is what I'm saying, and they want to do good. And they don't necessarily need it, . . . you know, to do war.

David: Right.

Emery: And it still hasn't gone that way, yet. But that's where it definitely could easily go.

I don't think any, you know . . . With all the drones out today, and all the other, you know, things we have that do not require a human being to be in to get the job done is where it's going.

David: Right.

Emery: So that's more of a threat, you know, for a drone to drop out of a satellite and be instantly deployed upon an area with stealth mode, and just, you know, . . . that with the simple technology of today. That's so archaic – I call it, but, you know . . .

David: I mean, it really does sound to me, just to summarize, that as Disclosure starts to happen, there are going to be so many surprises that we hadn't even anticipated that just this technology alone is like "Ascension" in a sense.

Emery: It is.

David: Yeah.

Emery: It gives us the ability to travel to the stars.

David: That's really amazing. Well, Emery, I want to thank you for being here. And I want to thank you for watching. This is "Cosmic Disclosure". I'm your host, David Wilcock, with our special guest, Emery Smith.

The Dangers of Being an SSP Insider Season 9, Episode 12

Cosmic Disclosure; The Dangers of Being an SSP Whistleblower

Season 9, Episode 12

14 Feb 2018

David Wilcock: All right. Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock. And here again with me is Emery Smith.

Emery, thank you for being here. I really appreciate it.

Emery Smith: You're welcome, Dave. Thanks for having me.

David: One of the things that we have talked about on Cosmic Disclosure greatly is this idea of a Secret Space Program. We haven't really covered that yet.

Now, you have confirmed the existence of reverse-engineered craft, so one would conclude, or one would be thinking to conclude, that if we have craft that are essentially space-faring vehicles that came here from other solar systems, or maybe even other galaxies, and we can build those, that we would then be able to leave Earth and potentially settle somewhere else.

So do you have any direct briefings or knowledge about that aspect of what may be going on?

Emery: Well, there is [are] laws out there, and there is a type of federation involved, from what I was briefed on.

And it's not a “you can just go . . .” Just like you can't just go from here to Europe without a passport, and a couple of weapons, by the way. So this is also applied to intergalactic travel.

So, yes, we do have the ability to “take ET home”.

David: As Ben Rich says.

Emery: As Ben Rich said. But the ability to actually do it is another story until we start behaving a little bit more proper here on the planet Earth and with evolving our consciousness and stop killing each other, which they all understand – extraterrestrials – because they were here, at one time, themselves.

So getting back to your question, yes, we have these craft. Yes, they are anti-gravity, and they can travel through space, but they're not interdimensional yet, that I'm aware

of . . .

David: Okay.

Emery: . . . so I've not been briefed on that. I know of people [who] say they do have this, but I'm not aware of it – of the craft.

So they're just using special propulsion units and other means to create a gravitational force for these devices.

A lot of the military devices we have out there, I mean, such as planes and helicopters, those are already installed in these special jet fighter craft.

So what's the best way to hide something is don't change the . . . because it doesn't matter what shape it's in. But that could be an actual spacecraft.

David: One of the things that Pete Peterson has shared with me is that there are a lot of new crafts that we've seen in various movies, like “Avatar”, like “Edge of Tomorrow”, in which they have turbo fans on them, which sometimes move. And he said that our Naval ships have all been loaded with these covertly at this time, and that eventually, once they roll out anti-gravity, that the jet engines or the propellers will be replaced with anti-gravity engines.

I'm curious if you've heard anything like that.

Emery: No, I haven't. I have seen different types of schematics for newer craft and ships and for the Navy and Air Force, and whatnot, that do show more of an anti-grav type situation, but not manipulating the current force, because I believe they already have these ready to go. They're just kind of sitting somewhere. And they already have it.

It's just I don't know where it's at, or who did it.

David: Okay. Another aspect . . . which it's a real shame that we couldn't get you on camera with William Tompkins – he's now deceased – but you have said to me that you have some insider friends who are around Tompkins' age, or maybe a little younger, who might be willing to come forward.

So do you think that maybe with you coming out on this program that this will help to set a trend where some others will now be able to come forward as well?

Emery: Absolutely. I mean, that's why one of the main reasons was to come out was to basically help other people and inspire them to come out and talk and feel free to

talk about some of the things they did with the projects, anything from energy to the extraterrestrials to medicine to all these fantasmical, amazing devices and things.

I think by being here, I'm hoping to inspire them, after they see this, to come forward. And I'm going to personally ask them myself to please come forward, or at least invite them to entertain it, or even have a private meeting with you and other people, if they don't want to show their face.

David: Well, and as you've seen, once . . . because I've interviewed so many insiders, once we start talking, all these things pop up.

Emery: Right.

David: And I might have heard something 15 years ago that I'll remember when somebody else tells me the same thing, or something very similar.

Emery: Correct. Right.

And that's what's so interesting, is to know that you worked on a project for so long and had no idea that this person also was working on a similar project halfway around the world.

David: Right.

Emery: And you can actually exchange information finally, freely, without being scared to do so. And just like some of the stuff I explained to you, you already knew some of this stuff.

David: Right.

Emery: And you knew I had . . . We've never even talked about it.

David: Right.

Emery: So for me, it's even a great confirmation, for me, to know that there's others out there that have spoken to you about these amazing technologies and places, especially the places, which blow me away.

David: Like the fact that Ecuador and Antarctica have very similar stuff.

Emery: Yes.

David: Yeah, and I've never said that to anyone . . .

Emery: Wow!

David: . . . and we just had it happen on camera.

I'm curious about whether you, through briefings or through maybe some of the insiders that you personally know, not including the people we've interviewed on Cosmic, are you aware of there being outposts on the Moon or Mars that we use with these back-engineered craft that we have?

Emery: You know, Dave, I've seen and heard a lot, but I don't have firsthand experience to say I was definitely in that spot.

David: Okay.

Emery: I may have been and not known it. But yes, I concur there's something going on there, and that there is some sort of a base set up there, of course, because that goes back to the other stuff I used to work with, with the portals and the other things, that you and I discussed.

Because you never know where you might be, but I did hear many of these stories that you have. But I was never on a briefing, by the way, that specifically said, "We have a base here or a base there."

I've just read a lot of classified documents from other people like me that were involved with that, so it was secondhand information.

David: If you have heard secondhand information, I'm hoping we can get a little more specific, because more than one insider – I think maybe five different insiders – have told me – and this would include Corey Goode as just one of them, and there were others well before I ever started to talk to him about this stuff – saying that, in fact, the majority of the solid planets and the solid moons in our Solar System have at least some degree of outposts on them now . . .

Emery: Yes.

David: . . . that we can use.

Emery: Yes.

David: So have you heard scuttlebutt like that?

Emery: Yes.

David: Okay. Could you be a little more specific?

Emery: Well, when you say “outpost”, it means a place to get to and go to. And it's usually not on the surface of that planet, so you know.

David: Okay.

Emery: It's on the inside of the planet, and they're using some sort of portal technology and craft to get back and forth from these places, when it is safe to.

David: So some of the rumors that you've heard, like, for example, let's talk about Mars. Have you heard rumors of there being, perhaps, in some cases, very large bases that might even have 200,000 people working at them on Mars?

Emery: Yes, I have heard that.

David: Okay.

Emery: Yes, I've definitely heard that. And it's kind of a known thing. It's kind of actually a joke in the underground.

David: What would be funny about it?

Emery: Well, you just never . . . Like we were talking about earlier, when you're on a conveyor belt going somewhere, going through energy systems, and then you wind up underground somewhere, and it feels different, like even the atmosphere feels different, what's not to say that they're using these things, and people don't know that they're actually on Mars working there?

David: Well, that's what you and I started to talk about . . .

Emery: Right.

David: . . . after we had described your travel through Sandia into this base where you did the autopsy. I started scratching my head after we did that interview, because you hadn't told me that part before.

Emery: Uh-huh.

David: But others had described the exact same hall as being a portal, and that when you start at the beginning, you're in one place, and at the end, you're in another.

And then I'm thinking, why would they waste 10 or 15 minutes of your shift having

you sit on a gondola?

Emery: Right. Yeah.

David: Because they have fast sub-shuttles, right?

Emery: Oh, my goodness, yeah. They have the maglev tubes and the trains and stuff like that.

David: Right.

Emery: But this is a little different. This is like what we talked about.

Yeah, I don't know, but you did open me up to a lot of other questions now that you said that, . . .

David: Right.

Emery: . . . because many other people have also expressed – that worked on these projects – that they felt different from where they THOUGHT they were. And now it makes a little bit more sense.

I never was thinking that, because I was so young at the time and wasn't as educated as I am now about all the stuff they DID have at that time.

David: Well, part of what occurs to me is that if you are potentially, as you said in previous episodes, autopsying potentially multiple bodies in one day, and they're all different. And we're going to get a lot more into that, and how they're different, and what they look like, in future episodes, because you're one of these insiders who's got a very complex testimony that's not going to be done in one or two half-hour episodes at all.

So if we are looking at all of these bodies – you yourself had 3,000 – how many other rooms do you think there were in this Sandia base, where other guys like you were doing the same thing you were doing? Could you speculate perhaps?

Emery: It would have to be, if I look at the levels, five, seven and eight were the levels that were medical for this type of thing.

David: Okay.

Emery: And each one of them had over 300 of these operating rooms.

David: Wow!

Emery: Yeah.

David: So you're looking at over 1,000 operating rooms just in this one base alone?

Emery: I believe so, yeah.

David: Wow! And so that would imply that if you . . . And over how many years did you see 3,000 bodies on the job?

Emery: Oh, my goodness, that was from August of '92 to '95 of June, so probably three years.

David: Basically three years.

Emery: Three years, yeah.

David: So that's like basically 1,000 bodies a year.

Emery: Well, it's tissue samples, not all bodies, remember?

David: Okay. But just to stick with that number for a minute, we could then say that one base alone, and that would be providing it's only one base, which it obviously is not . . .

Emery: Right.

David: . . . that they could be processing over a quarter million different extraterrestrial species on autopsies per year.

Emery: Well, if you did the math, and you were counting each sample as one species, yes. But it could be many samples from one species for a whole wing of 50-unit rooms.

David: Right. It could be a bunch of guys like you doing it.

Emery: But yes, if it was per species, it would be that many.

David: So to extrapolate, if NASA is now saying 40 billion watery, Earth-like planets just in our Milky Way galaxy alone . . . and they kind of slipped that under the radar. I mean, most people haven't even realized that that came out.

And we've had other insiders tell us that that was part of a treaty with benevolent ETs, forcing our guys to start leaking things like that, to make it easier for Disclosure to happen.

But if there's 40 billion Earths in our galaxy alone, and life seems to be very abundant, and intelligent life seems to be written into the background of quantum mechanics itself . . .

Emery: Everywhere.

David: . . . then even a quarter million bodies, a quarter million species, is not that many . . .

Emery: No, it's not.

David: . . . compared to what could be out there.

Emery: That's nothing. And when I told you the 3,000 number, everyone always gets a little surprised, but when you think about, as you just said it, it's a very small number.

David: But what . . . Okay, if we peeled back the curtain here, Emery, and we do a little imaginative speculation, doesn't it appear that your job, and what you personally dealt with, could be the byproduct of exactly the sort of Secret Space Program that we're talking about, where part of the testimony was that there's no money, but that you get paid in trade?

And do you think possibly that those bodies were payments that we were receiving from other groups in exchange for apparently, all this high tech that we're making?

Emery: It's a possibility, yes. And I also have to reiterate, out of the 3,000, over 3,000, samples, I call them, don't forget some of those could have been lab grown. Those could have been just hybrid things they made here.

David: Right.

Emery: So I can't speculate they were all extraterrestrial. I mean, I know a lot of them were of un-Earth origin, but so . . . Yeah, they could be absolutely from some sort of a trade, inside trade thing, going on, to get technology and to learn other things.

David: And the nature of compartmentalization, right, you're not allowed to ask any questions. You're just going in there, doing your job . . .

Emery: That's right.

David: . . . handling this very exotic stuff.

Emery: Yes.

David: What was it like when you'd come home at night having autopsied something very bizarre-looking, let's say?

Emery: It was fascinating.

David: What would you feel when you're lying in bed at night? Were you able to go to sleep, or would you . .

Emery: Yes.

David: . . . sometimes just be . . .

Emery: No, I was fascinated. I'm always intrigued. I was always intrigued about the human body. So for me, it was just a fascinating thing. I wanted more. I was upset that I would have to go and work in a hospital every couple of hours.

So it was really neat to see all this stuff and then go home and say, “Wow! What else is out there?”

And that inspired me to do more things and take more opportunities with the military and other industrial complexes.

And that just opened up so many things, because I had so many answers, like everyone else did. I want to know what's going on.

And I can't believe . . . I don't believe anything I read, see or hear. I can't, because I know that it can all be so modified, especially with the new 3D programs they have on the satellites now.

I mean, they could put another David Wilcock right here and reflect light and cast a shadow and have light glistening out of your eyes. And you couldn't tell the difference.

So at this time . . . of course, with photoshopping and everything else, it's very hard for me.

So I decided, at a very young age, I'm going to go out, and I'm going to find out for

myself.

And I was doing this strictly just to find out for myself what is going on. And all's it did was open up 100 million other questions.

Every time you find something else out, it opens up more questions, which is great, because it inspires me to go ahead and keep moving forward, especially if there's opportunities there where people want me to be part of amazing projects.

I'm very thankful of all my opportunities I had. They were not too negative.

So I think, if that would answer your question of why I did that.

David: Corey Goode has also shared with us that there were factions in the Secret Space Program, and one of them was called the Interplanetary Corporate Conglomerate, or ICC.

And, apparently, they are offshoots of the defense contractors who are manufacturing very advanced technology.

And, apparently, we, humans, have become a go-to-place for many different species to buy advanced technology, like craft.

And he also said that he found out that we apparently are in regular trade relations with some 900 different extraterrestrial civilizations just through the ICC.

So I'm curious if you ever heard back chatter, scuttlebutt, anything like that?

Emery: No. I'm unaware of that, and I've never heard that before.

David: But it's so compartmentalized, right? That's the problem.

Emery: Yeah, I would not know. It's really hard. You're never alone, and you're always monitored. Like I told you, you always have the bracelet on. It's such high security.

I mean, there's hallways there that will cut you in half if you are in the wrong place, without asking questions.

So it's a very simple job if you just follow the dots. Ha, ha. But if you don't, you've got to be careful.

So I didn't really go around asking questions, because I was too excited about getting

more security clearances and moving up the ladder to get more jobs in different places other than dissecting tissues.

David: Right.

Emery: And it did. It brought me to the crafts. It brought me to other things.

David: Okay. One of the things that you told me about that I think would be a good point for us to get into . . . I was asking you about the folder, which is this thing that . . . They called it a folder, maybe to reduce psychological impact, but it's basically like an iPad with a little bit flexible . . . and almost totally clear.

Emery: Yes.

David: And you also said that the folder could be loaded. It would tell you what wing, what room, and what being you were going to be working on. They would only give you one at a time.

Emery: Correct.

David: So did the folder have any type of hard drive or storage mechanism?

Emery: Yes, it did.

David: Really?

Emery: I'm surprised you mention that, but, yeah. It's called a micro disk.

David: A micro disk.

Emery: Yeah, it's a little bit smaller than a quarter, but larger than a nickel. It's gold-plated, made of some sort of iridium gold, and there's a little, teeny slot for that.

And it records everything that you're doing.

David: Hm.

Emery: And it also connects to the construct of the base, of the underground ba . . . - what construct is there, like, mainframe.

So that little thing is then taken from you and put on a shuttle, and they store it in space – all the disks.

David: Really?

Emery: Yes.

David: So I would imagine that if you had your folder in the early 1990s, when we're back with the whiny, loud, desktop tower computers, that we're dealing with something a lot more advanced than even what we have now.

Emery: Oh, this is far more advanced than anything that you guys have today, right now. I mean, we're talking high resolution video pictures and millions of documents of information, you know, all on this little small, very, very thin disk.

David: So do you think these disks might have like thousands of terabytes of storage or maybe even more?

Emery: Yes, I would concur to that.

David: So what was the protocol? Did you have to remove the micro disk from the folder and hand it to someone? Or did you just hand your folder in at the end of the day?

Emery: No, yeah, the folders, number one, when you put them in and slide them into this thing, the disk comes out. But you can take that disk out, just like you do today with SD cards or cards for your camera.

David: Okay.

Emery: You can easily take it in and out, which sometimes you had to, because you had to review another, . . . someone else's project.

David: Oh.

Emery: So that's why that was there, so instead of it being automatically downloaded, . . . They didn't like information going [over] a wire, so they use these disks for that.

David: Where on the folder would you insert . . .

Emery: Top right corner.

David: Top right corner. Interesting.

Emery: Yeah.

David: So I guess you could see it then, because it's . . . You said it's a gold color.

Emery: Yeah, you could see it inside. And it has like an iridium tint to it.

I always wondered if they did that to protect it from the radiation of space, since it was stored in space, they said.

David: Was there any way to access the information on the disk other than the folder?

Emery: Yes, there is one way.

David: Hmm. Is there some kind of reader or something?

Emery: There is a disk reader, yes.

David: Really? And I guess the reason why they haven't given us that kind of storage technology would be what? Why don't we have that level of data storage if the technology exists? Why would it not be shared with the public?

Emery: Because then you won't go out and buy a 256K phone.

David: Ha, ha, right. It's just too far advanced from where we are now.

Emery: They won't make any money, these corporations. Come on.

David: Right.

Emery: I mean, we have to start really, really small for these corporations. They already have it, but we're not going to get it right today.

David: It seems like . . . If you see the movie “Snowden”, allegedly, he was able to get one of these little USB sticks inside a Rubik's cube, . . .

. . . and then he tossed it to the guy, and he went through the gate.

Emery: Right.

David: Do you think anybody has ever tried to get a mini disk out of the base?

Emery: Yes.

David: How might that be done?

Emery: It's tricky, but can be done, yeah.

David: Okay, you don't want to go into that.

Emery: Well, I had a few of the disks, yes.

David: You did?

Emery: Micro disk, yeah.

David: How might somebody be able to do that?

Emery: Well, I'd rather not say that part.

David: Okay. Okay.

Emery: Ha, ha, ha.

David: Ha, ha, ha.

Emery: But I have acquired a few of those disks, yes.

David: And when your house was broken into, were those some of the things that were taken?

Emery: Yes, they took the disks.

David: Really? So you did have them . . .

Emery: Yes.

David: . . . but you lost them?

Emery: Yes.

David: Yeah, that was very, very unfortunate.

Emery: It was very unfortunate – very angry about it and upset.

David: Could you tell us a little bit about what happened to your house, and where you had stored those disks, and how were they found?

Emery: Oh, sure. So I had a small home in New Mexico that was gated with an iron

gate and concrete post and a keypad, the whole thing. A very small, small home that I temporarily got just to store some small belongings and stuff, because I was working on a project out in southeastern New Mexico, and I was there for about a year, nine months. I had this place.

So what I did was: I, of course, . . . I don't keep all my stuff in the same spot . . .

David: Right.

Emery: . . . and I keep some duplicates, but there's no duplicates to this. I can duplicate some things, but a lot of just information on hard drives, and whatnot.

And I got a call, because I was going to be moving to Los Angeles to be with you and work on some other projects.

David: Yeah.

Emery: So I told the realtor, “Hey, I'm going to be moving.” So they put it up for sale, and I was just leasing the place at the time.

And I had basically hidden all my stuff inside the walls of the house, and you couldn't tell where they were – also in the concrete and other various places. I don't want to talk about other specific places, because I still use those techniques.

But I thought it was safe temporarily for this.

I also had the overunity device there, which, fortunately, I went to go pick up. And it was within a week that the house was ransacked. And another week later, it was ransacked.

And that's when the realtor called me and says, “Oh, my goodness. I looked through your window. You left your house such a mess. How am I supposed to show anybody?”

And I said, “My house is perfectly spotless. I don't understand.” And I said, “Please, go around the house and look around.”

And he did, and he found the back garage door was broken into. And then the double bolted locked door to the main home was kicked in with a big footprint. And we have all the pictures.

David: Let's roll right now the film that you took.

Emery: Sure.

[Emery's comments on the video clip of the break-in to his house:]

"This is the garage – complete destruction. Took all the equipment. The lab has been completely destroyed."

David: So why do you think whoever did this would take everything you've got and leave only your military badges in a box and a bullet on the countertop? What was the message?

Emery: Oh, I think they were just some old friends trying to look me up to have a good time. Ha, ha.

So I think it really had to do with the device, number one, because ever since I started the lab with the device, it's been getting . . . it's been getting really crazy.

And now that I proved the device worked, then it got really crazy.

And, of course, they used a satellite and found out all the stuff underground and in the walls.

David: Right.

Emery: And they did cut the walls open and take all those hard drives and everything else.

We're talking about 8 computers, 12 laptops, 40 hard drives, over 300 SD cards, lots of information – my world's . . . my whole 30 years of work.

David: What's the purple tip?

Emery: Oh, oh, it's just the type of bullet it is, yeah. It's a very high velocity bullet.

David: Okay.

Emery: It's not normally a civilian bullet that you can buy from civilians.

David: Okay.

Emery: And it was a 5x7x28 armor-piercing ammunition, which is used by tactical forces all around the world.

David: What could you say to other insiders who would hear a story like that and say, “Well, my god, if they start doing that to me, the first thing I'd do is go into hiding, and I wouldn't speak?”

Emery: Well, let's talk about it, because I wasn't going, at that point. I wasn't.

So I think the information, too, that I had was . . . I couldn't see . . . I couldn't really see the information that I had, . . . like 90% of it was pretty much just already out there stuff.

David: Right.

Emery: So I think it was just that 10% AND the device that, “Hey, just why don't you slow up a little bit, because you're going on a trajectory here that looks like you're going to say something that you shouldn't say.”

David: Right. So they were trying to threaten you.

Emery: Yes.

David: Do you think that anybody who comes forward is safer than if they don't, if they're already starting to speak a little bit? Is it safer to be public?

Emery: Yes. At a certain point, you have to go public. It's very . . . It's much safer. We all know this, and this is one of the main reasons I'm here in front of you right now.

David: Right. All right. Well, there you have it. This is Emery Smith, and I'm David Wilcock, “Cosmic Disclosure”. And I want to thank you for watching.

Cosmic Disclosure Season 10

Corey Goode, David Wilcock, et al

Tragic Consequences on a Mayan Ship Season 10 Episod 1

Cosmic Disclosure;Tragic Consequences Aboard a Mayan Ship

Season 10, Episode 1

---

21 Feb 2018 [images blocked]

David Wilcock: Welcome back to "Cosmic Disclosure". I'm your host, David Wilcock, and I am here with Corey Goode for some very exciting updates coming from the cutting edge of our Solar System's transformation.

Corey, welcome back to the show.

Corey Goode: Thank you.

David: Could you tell us what exactly has happened to you? Just give us a broad summary of some of the talking points of what occurred to you back in December 2017.

Corey: Let's see. I've received quite a number of briefings from the Earth Alliance over the last three months.

And also, the SSP Alliance has been popping up a lot more and showing their faces again.

David: Hm, that's good.

Corey: And I also spent some time with the Anshar.

David: Could you just walk through with us how this whole new chapter had started for you, because it kind of seemed like things had gotten quiet for a while?

Corey: Well, they did, but I guess a lot of the . . . for about 10 weeks, I was receiving dream-type of information that I needed to prepare for a major meeting with the Blue Avians and the Super Federation.

And they also warned me that I needed to prepare for a meeting with the . . . I think they called them the Council of Saturn, . . .

David: Right.

Corey: . . . which was going to be an introduction to two of the new Guardian species.

David: Sure. And both the terms, "Council of Saturn" and "Guardians", are used extensively in Law of One material. So that's very interesting.

Corey: Correct.

David: The first of these adventures that you had actually happened in mid-October 2017. So could you describe for us what took place then, and how does this all begin?

Corey: Correct. We were preparing to move, and my wife had been very busy packing crates and boxes. And it was about 3:00 in the morning or so, I was sitting in my living room with boxes and crates everywhere.

Suddenly, there was a flash. And now I'm up on the Mayan ship.

But I found myself in a very distressing situation on the Mayan ship.

Normally when I go there, it's very serene. I'm guided to a room where, you know, I'm examined, and they do work on me for this temporal dementia issue that they're working on.

But this time it was a very frantic environment. It was strangely quiet. But immediately, Gonzales grabbed me by the elbow and started pulling me towards an open door – one of the double-wide doors – going into the exam area.

So he grabs me by the elbow, and he's pulling me, and he's telling me, "There's no time to explain. I just need you to go in and let yourself be seen."

And I had one hand on the bulkhead, and my feet planted, and he's pulling me, and I'm asking, "What's going on? What's going on?"

And he . . . I think he's about to explain it to me when he tells me, "You just need to be seen." And he shoves me through the door.

As I was being pulled towards the door, I saw Mayans going in, and they had these weird things in their hands that look like . . . kind of like an ax head – like a double-bladed ax head.

But, I mean, it wasn't sharp. It was just the shape of it.

And they were holding them in their hands like this [Corey has each hand on each edge and holding the ax head in front of him with the flat surface facing the enemy], kind of like a shield and a weapon, and they were holding it up and walking in, kind of hunched over.

David: Hm!

Corey: So it was obvious something different was going on.

David: Well, that's kind of strange because you typically describe the mood there as being very high vibe and healing and peaceful.

Corey: Yeah, it's normally very serene. And this time, I mean, like I said, there was a very frantic energy.

Once I was shoved through the door, I saw why. I looked, and, peripherally, I saw Mayans laying on the floor with those ax-head looking instruments, weapons, kind of just bobbing up and down floating.

David: Hm.

Corey: And they were obviously dead. Their bodies were contorted, and they were obviously dead.

But what caught my attention was across the room: This being that was in somewhat of a mirage-effect-looking field that was like a bubble. And he was floating above the ground.

And he was a Reptilian, but he had very human-like characteristics, I mean, human-looking lips, the cheekbones.

David: Hm!

Corey: It looked like snakeskin stretched across a human type. It had a slightly elongated skull.

It's eyes were yellow, and it had black slit pupils.

Just like with the white royal Reptilian, the one that psychically grabbed my mind, . . .

. . . its pupil was doing this [Corey moves his thumb and forefinger together and apart] – opening and closing at a rhythm.

And it was wearing . . . It didn't have shoes on, but it had black almost with metallic-sheen-looking one piece that almost looks like how yoga pants kind of cling to you.

David: Hm.

Corey: He was wearing that. And then he had a cape – a pretty intricate cape. And he was floating above the ground, and his eyes were [opening and narrowing], you know,

. . . And the Mayans were engaged with him.

And I thought I was about to interface with him.

And what happened was: He turned his head to look at me, and his eyes went, “Vwoom!”, yellow, solid.

And he started to address me by the “Hanush” name that they use for me.

And right when he was about to address me by that, I heard a loud “snap”, and he fell to the ground.

David: Hm! So this would imply that he was distracted by you being there enough that they had just this little narrow window to take him out.

Corey: Right. I thought I was being brought in to negotiate or communicate, but I was being brought in as a distraction.

David: So this is a really interesting point here. When this Reptilian calls you by this name, you say “Hanush”, and what it sounds like to me is “Chanokh”.

When I say that, does that sound right to you? Have you heard it pronounced that way?

Corey: Right, right. They pronounce it all a little differently. It's a name that they've called me from the beginning, but when they call me the name, I don't feel this huge energetic connection or ego connection to.

David: Right.

Corey: But from the beginning, they called me Raw-Hanush, or Chanokh.

David: Chanokh.

Corey: Yeah, -Eir.

David: So the reason why I'm saying that so specifically is that this is actually a Hebrew word that most people would identify as “Enoch”. And you've seen me present on the Book of Enoch, and the really interesting thing about it is: It's as old as the book of Genesis.

It's very interesting because it talks about giants on Earth being cannibals and that the Great Flood was created to cleanse the Earth of them after all the harm they were

doing to humans.

Chanokh, in that book, was the person that these evil beings, that they called “The Watchers”, used to communicate with the good guys, who were called the “Elohim”.

So when we actually studied the etymology of Chanokh, it means “messenger”.

Corey: Right.

David: How does this strike you? It seems like there's no accident that they gave you that name.

Corey: No. And, I mean, from what I've gleaned is that this is not . . . It's a title. It's not a name.

I'm not saying that I was Enoch, and I'm back, you know.

David: Right.

Corey: Far from it.

Whenever I've talked to the Blue Avians about reincarnation, they always say, “We are one, or we're not all one”.

David: Right.

Corey: [It's] one of the two. So no, it's more of a title.

David: What was the connection between this Reptilian being and this title of “Hanush” or “Chanokh”?

Corey: Well, he recognized me as that position, and he was either taken off guard, or he respected the situation enough to where he probably thought he was about to have a dialogue that he disengaged a battle and turned his attention to me, when obviously that can be deadly.

David: What was the idea, then, of how he got there? And what was going on with this story? Did you get any information?

Corey: I did, but a little bit . . . I'll give it right now because some of the information I received later on, because things occurred so quickly, even after this.

David: Hm.

Corey: What had happened is that the Mayans had picked up this political prisoner from somewhere in the southern part of Africa.

And they had gone in and done an operation and removed it. But from what I'm told, they overestimated their abilities and underestimated that being's abilities.

They thought that they were going to be able to bring it up in a flash, and then put it immediately into stasis, and it didn't work out that way.

David: Now, Africa, meaning like an underground base of some kind?

Corey: An underground city, I'm told.

David: Hm. Did you get any information as to why it looked like it was a human-Draco hybrid?

Corey: No, but like I said, I had never seen this type before. It was obviously very important.

David: Right.

Corey: You know, it looked like a prince or something.

David: Was it more of a conventional height compared to us than the other Draco that you saw?

Corey: Yes. He was about 6', 6'6" tall.

David: Okay.

Corey: And the bone structure was very human.

David: So what was the next thing that happened? You said it was moving very quickly.

Corey: Right. Well, apparently, they were doing some sort of a prisoner transfer that went bad. And I was brought in in the middle of this.

And Gonzales was like, "Hang on. It's not over with yet. Just let them see everything that you saw."

And I don't know who "they" are yet.

Gonzales is trying the best he can to explain what's going on, and there's no time.

Basically, he told me about that, “We were doing a prisoner transfer. It was very important that we delivered this being alive to where we're about to go.

“We need you to open your mind and let them see everything.”

And before I could protest, ask any more questions – another flash!

He was looking over at one of the Mayans in particular. The room was filled with them.

He was looking over at one of them that was over at one of those consoles that had the flashing symbols on it that floated.

And then we ended up in the cavern.

And the being that was killed was like 20, 30-feet away from me at least – its body.

When we appeared in the cavern, it was at my feet. And it's cape was spread out, kind of, and flipped over its head.

David: You're seeing this body in front of you, but they had covered over the face?

Corey: No. Well, it's just kind of how he was laying – haphazardly. He was laying kind of on his back up against a rock that he appeared on top of, kind of this way with his arms together, and the cape was out across . . . out and then over his head a little bit. It was just kind of haphazardly the way he was.

David: Okay.

Corey: The cape was white, green, brown and blue – the colors. And over one shoulder was the tail of a white snake, and it went down the back of the cape and went up and down several times, like four or five times.

And then the head came up over this shoulder [Corey motions to his right shoulder] and was like this with the tail. [Corey has his right hand, representing the snake head, on his chest pointing toward his left hand, representing the snake's tail, which is on the left side of Corey's chest pointing toward the “head”.]

And the overall cape was blue and looked kind of like water, like a water background, and the white snake undulating up and down.

Then you saw brown stems coming out of the snake, like the snake was some sort of plant.

And then there were these very bright, huge, fern-like green leaves.

David: Were you alone in this cave? Who else was there?

Corey: No, there were a handful of the Mayans, and then Gonzales and myself.

David: Okay.

Corey: And we look up and there are like two plateaus – cavern wall and two plateaus. And about this large [Corey has a thumb and forefinger spread about three inches], these figures came walking out.

And on one side I could tell they were Nordic-looking. And there were also what looked like the Ebens, a little bit, kind of orangish skin and a pear-shaped head.

David: Just to be clear, when you say “about this large”, that's just what it looked like from your vantage point.

Corey: Perspective. Right.

David: Okay.

Corey: Right, perspective. You know, they were about [appeared to be about 3” in height] . . .

David: Sure.

Corey: . . . about like that.

And then on the other side, these weird Reptilian-looking beings came out, but I couldn't see the details. I could tell there were a couple of different types.

And on both sides, they kept turning back like they were looking back to someone, like looking for approval or reporting or something.

Then immediately, they all, in chorus, began to communicate or connect with my mind. It was like a chorus . . . It was an interesting . . . It was a little bit different than what I've had occur before.

And then they replayed the scene from when I appeared on the Mayan ship over and

over and over in my head, like many, many times. And then they disengaged.

And when they disengaged, I looked over and saw Gonzales and a couple other of the Mayans that were going through the same process.

David: So they're replaying the scene. Did you get any sense of an emotional temperature? What were they feeling about it? Were they happy about it? Were they sad about it?

Corey: Well, the Mayans were upset because we were supposed to deliver this being alive.

From the other beings, I didn't get any type of hit.

David: So was there any other information they conveyed to you besides just replaying the scene? Did you hear any . . . ?

Corey: No.

David: Okay.

Corey: They were just there using me as a USB drive, basically.

David: Hm. Just reviewing what was in your head.

Corey: Right.

David: Was there something unusual about the way they accessed you telepathically that was different from what you've experienced before?

Corey: Yes, it was all of them at once. It was like a chorus.

And then some of them wanted to see it again, and others were wanting to see different parts. So it was disjointed the way it was playing back in my head. It wasn't playing back linearly all the time. It would jump around.

David: So after they interfaced with you, what happens next?

Corey: I am sent home in the same flash.

David: Really?

Corey: No explanation.

David: No information.

Corey: Nothing.

I've met with Gonzales a couple of times since, but haven't had an opportunity to really get into the details about who that being was. You know, he was obviously very important.

It'd be interesting to see if there's any intel out there about a missing being from that city in Africa.

David: As a general overview, it would seem to me as if this type of political prisoner wouldn't have been captured if there weren't already some major victories for the SSP Alliance.

So could you just try to again speculate as to . . . Would you say this is a kind of far-along development in this war – like a sort of endgame final conclusion-type of development?

Corey: Yes, it's definitely . . . and a lot of my briefings have kind of dwindled because we're in an operational phase.

David: Right.

Corey: The Earth Alliance is out there operationally working on ending this Cabal/Deep State.

Now, on each level, we have the same thing going on. We have, you know, the SSP Alliance sees an opportunity to come back now.

A lot of key people were either killed or disappeared from their organization.

David: Right.

Corey: And they've had a few new interesting additions that we'll be talking about later.

David: You had mentioned before that there's an optimum timeline where we get Full Disclosure.

It's really interesting to me to note the parallel between this apparently very high-level Reptilian being being apprehended by the SSP Alliance, and then the briefings we've gotten terrestrially about more and more high-level Cabal people being apprehended

here on Earth.

From what you've heard from the SSP Alliance, and we can take it right up to today, do they feel that we will be able to get Full Disclosure and not be stuck on a 50~100-year Partial Disclosure?

Corey: Well, that's the goal of the SSP Alliance. And they have a few tricks up their sleeve that I'm not going to go into that they are going to pull out if a Partial Disclosure narrative is pushed.

David: Hm.

Corey: But for the most part, the Earth Alliance and the Military-Industrial Complex Secret Space Program, they're under the agreement that the public cannot take all of this information dropping on them at once.

They think that it has to be drawn out over 20 to 50 years.

David: Based on your experience of us reaching millions of people, do you think that's true?

Corey: No. I mean, it's obviously going to be a rough time. We've talked about it before.

You know, it's not going to be a kumbaya moment where everyone holds hands and sings. It's going to be more of a time of rage and dealing with karma than anything.

David: Do you think that a Full Disclosure timeline would include people finding out that many of us here have extraterrestrial genetics and home groups, and that we are being abducted by our home groups and then re-abducted by this SSP?

Would that be part of the Full Disclosure if that were to actually happen?

Corey: It would absolutely be a part of the Full Disclosure. And a lot of these, I guess, our cosmic cousins from the local 52 stars in the local star cluster, are not going to let a Partial Disclosure occur.

A lot of these groups have been told that they have to disclose ETs, or the ETs will disclose it. And many of them are the people that are waiting to come down and assist us.

David: So can we move forward, then, to the next event that happens to you that's of significance?

How did you feel about being used to kill this being?

Corey: Well, it happened so fast I really didn't really know what was going on until the snap happened. It was a very audible snap.

David: Was this a neck that broke, or . . . ?

Corey: Yeah.

David: Okay.

Corey: Yeah, his head was all twisted and contorted around.

David: Really?

Corey: But, I mean, I thought I was about to interface with this being. I wasn't looking forward to it, because I was flashing back to that royal Draco.

David: Absolutely.

Corey: I wasn't very happy that I was used. I felt used. But at the same time, I was able to kind of rationalize why and what happened.

David: So let's just be clear on something here, and please don't take this the wrong way, but you don't have superpowers. I don't have superpowers. We're just regular people who have gotten into these strange positions.

Why do you think they would take a regular guy like you and throw him into this kind of role where he is THE intermediary between the bad guys and the good guys?

Corey: A lot of it is not being an intermediary. A lot of it is just being a witness.

If they have me witness something on behalf of our collective consciousness, it enters into my consciousness and then filters out into everyone else's consciousness.

So that's some sort of cosmic law thing that they have to do when they're working with groups.

David: So this Reptilian being, they were trying to keep it alive. And if they had kept it alive, what would have been the end game there?

Corey: First of all, you can always gather intelligence, you know, from the

interrogations. But the reason they wanted it alive is that beings at this level are so advanced that if you kill them, they'll just reincarnate with the full knowledge of who and what they are into another life form.

David: Hm!

Corey: So it's kind of a little trick. They anchor the consciousness to the body by putting them in a cryogenic-type sleep, or stasis.

David: Weird.

Corey: And that's another weird cosmic law kind of thing that I don't fully understand.

But the interesting thing is that in our Solar System there are a number of, some of them very ancient, prisons, one of which is an asteroid that's been hollowed out. And it's full of cryo-prisoners.

David: In the Law of One, they always are talking about First Distortion of The Law of One – First Distortion, First Distortion. And they keep bringing this up.

And they say it's the main law that the universe is founded on. And they say that that is Free Will.

So how do you think this concept of the First Distortion, how they're always trying to protect the First Distortion, would relate to the fact that the SSP Alliance had to talk to the Guardians through you, the fact that the negative beings have to talk to the Guardians through you?

How do you think that preserves Free Will? Why do they have to do it this way?

Corey: Well, I mean, they do everything in a weird way – I mean, even how they approached me. They had to approach me in dreams at first. And then basically negotiate with my higher self whether I would get any type of physical encounters or what I would have to do to prepare for them.

So it's a path. It's always a path.

David: I find it really interesting, Corey, that you have the SSP Alliance capturing really high-level prisoners now, maybe for the first time. And it seems that the Alliance here on Earth is also capturing high-level prisoners for the first time.

Could you give us some sense of what those developments are on Earth, and where this is taking us in the short term, or the fairly short term?

Corey: Well, the developments on Earth are going to need to catch up to the developments that have occurred recently in the heavens, I guess you would say.

And, you know, we'll cover in detail the fact that humans are going to be given an opportunity to govern ourselves, to not have to deal with alien races coming and tinkering with our genetics.

There's a new Golden Age that we're going to be presented with, and how we handle entering into that Golden Age is going to pivot what kind of a temporal reality we're going to end up in. But WE will be in control. We won't be managed. We're going to be self-managing.

David: So once we have freed ourselves from Draco rule, how does that affect the basic way that our society runs – like, let's say education, government, medicine, philosophy, religion – things like this?

Corey: Well, what we're seeing on Earth is the beginning of them taking out this control system and mind control system.

When, like I said, the Earthly events catch up to what's going on cosmically, then we are going to have an era of open information.

We're going to receive the correct physics models, the correct mathematic models. We're going to learn a lot more about our cosmos, and we're going to become a part of this cosmic neighborhood as an interstellar civilization.

It's going to be a very exciting time for us.

David: Well, that's a really positive message. And I want to thank you, again, for your bravery, stepping forward and giving us this message. And I want to thank you for watching.

This is “Cosmic Disclosure”. I'm your host, David Wilcock, bringing you the latest updates with Corey Goode.

End of the Super Federation Season 10, Episode 2

Cosmic Disclosure; End of the Super Federation Season 10, Episode 2

27 Feb 2018

David Wilcock: Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock. And here again with this fascinating interdimensional adventure is Corey Goode.

Corey, welcome back to the show.

Corey Goode: Thank you.

David: So, where we last left off, you had had an experience regarding this Reptilian being you hadn't seen before, where you were used almost like a pawn in some greater cosmic battle.

What happened after this weird experience?

Corey: Well, I was still meeting with Gonzales on a regular basis, and it was mostly of a medical nature.

But it was soon that I started having these dreams to where I would dream that I was back on one of the Spheres. Or I would dream that we were in my living room conversing.

David: “We” who?

Corey: Teir-Eir.

David: Okay.

Corey: Right, the main Blue Avian that I communicate with is Teir-Eir.

David: Okay.

Corey: And he had been approaching me in dreams. And a lot of them would be . . . I would be having a normal dream, and then it would just morph to where he was there.

So if I was having a dream that I was on the countryside, just as an example, all of a sudden, he would break into that dream and then kind of . . . It would be taken over.

David: Hm!

Corey: And basically, what he was preparing me for is that he said: in a number of days, I was going to be brought up to meet with the Super Federation to where Teir-Eir would be present.

I would be basically, interpreting or delivering a message for him. And then shortly after, I would be going to the council at Saturn to greet the two new Guardians.

David: And at this stage, did you have any sense of what "the two new Guardians" meant – what that actually would be?

Corey: Yes. For three years nearly now, or more, Teir-Eir told me that at some point, the Blue Avians and the Golden Triangle beings were going to fade out of our reality, and a new guardian, that was a part of the Sphere Being Alliance, was going to come in and assist us from that point on.

David: Was there a sense that there was going to be some stress for you in doing this meeting?

Why was so much preparation necessary in this case?

Corey: When you hear that there's a meeting of this type going on, there's always stress involved leading up to it, because they never give you too much information beforehand.

Usually, you are just thrust into a situation and have to deal with it.

David: So when exactly did this next big meeting happen that you were being prepared for?

Corey: Well, on December 16, 2017, in the middle of the night, when I got up in the middle of the night, a Blue Sphere appeared in my room.

So, you know, that's about the type of warning you get.

I had some clothes laid out that I had out for a couple of days that were nicer – more like the clothes I would wear on "Cosmic Disclosure" – . . .

David: Right.

Corey: . . . because it sounded like an important meeting, and I didn't want to show up in my underwear again, ha, ha, ha, which has happened.

David: Ha, ha, ha. Indeed.

Corey: So they . . . I got up. I got dressed, and the Sphere took me away.

David: So walk us through what happens now. The Sphere picks you up.

Corey: Yes.

David: And where do you end up next?

Corey: I end up on the Super Federation, just outside the . . . in the foyer, just outside the main doors to the meeting hall, where the stairs go up to the main doors.

And there are plants that are around at the bottom of the stairs. And I appeared down close to where the plants are.

And I didn't know where I was for a moment. So I kind of stepped behind the plants a little bit to get a little bit of cover, but then I saw Gonzales and a couple of the Mayans standing not too far away.

David: But I guess you had been prepared already in these dreams that there was going to be a Super Federation meeting. So then you realized this is what you had been prepared for, correct?

Corey: Yeah, but when you say “prepared”, they say that there's going to be a meeting. And that's all the preparation you get . . .

David: Ah.

Corey: . . . no other information.

David: Okay. So who spoke to you first, and what happens next?

Corey: Gonzales saw me standing over there looking all awkward and immediately left the two people he was with and walked directly to me.

He grabbed my shoulders and shook them, and he said, “Are you ready for this?”

And I said, “Ready for what?”

David: Ha, ha.

Corey: I have no idea what's going on. And he was just . . . He was smiling, and he

was very upbeat. And he was saying, “That's typical!” - that kind of thing.

David: So where does he take you? What happens next?

Corey: Well, we walk up all the stairs, go through the main door, the middle door, and as we do, the assembly room is packed. It is . . . I've never seen this many beings there.

And, you know, there are a lot of ET beings that you would think of that look completely different from humans. But then there were a lot that looked very human that were there.

David: Very human meaning passable – that they could be walking down the street?

Corey: You know when Columbus visited the United States for the first time and saw the Native Americans there, they had never seen that type of human.

David: Right.

Corey: And this is the same type of experience. You're looking at just a different race or type of human.

David: Hm. Okay. So it's really crowded. And what was the mood like in the room?

Corey: There was a lot of excitement.

And it was not quiet in that room. There was a lot of moving around, murmuring.

But as I was being led, he was leading me through the crowd in this open walk area towards the chair that was designated for us.

And what I'm talking about is there are horseshoe-type seating arrangements to where there's a main chair that's a little bit raised, and then three smaller chairs sitting below in a half moon.

And we were walking towards the one that was designated for us.

And as we were walking past, I look over to my left, and there are five aquatic beings that I've never seen before.

There was a cylinder, like an atmospheric cylinder, floating off the ground about maybe a foot or two, that was just water.

David: Hm.

Corey: There was no glass, no apparatus hooked up to it – nothing. It's just water in like a force-field cylinder. And in it were these aquatic beings.

This being, when it was in the water, it looked like it had feet, but they were sort of like walrus feet. It was like a walrus tail.

When it didn't have its tail fanned out, it looked kind of like feet hanging. And then to keep its position up and down, its tail would fan like that *[Corey releases all his fingers of both hands toward the floor and then close them and then repeats the motion]* to help keep it up and down.

And it looked sort of like a walrus body moving up to the torso.

And then when you get to the head, it had like these . . . It was almost like manatee lips on both sides, very large, that would open its mouth into a curve, into an oval like this, *[Corey creates an oval with both hands]* to suck water in.

And then it was shooting water out two jets on the back of its neck, behind it, where its ear would be.

This was keeping it up and down the way it wanted to.

David: Let's talk a little about the eyes and the way the rest of the head looked for a moment.

Corey: The most striking thing was this balloon-looking thing floating above its head. It had some sort of a cord connecting right where its third eye is, with this very large balloon that was filled with some other kind of liquid.

And when he would turn his head, it would move too. It would like of like slosh, move around, as he would turn his head.

And it was obvious that this had something to do with the way it was communicating and also maybe mapping out its environment.

David: Hm.

Corey: What was interesting, though, is when it did . . . and it didn't communicate very much, but it did have a couple of outbursts later, to where little flashes of light were popping in the water around it.

David: Hm. So it might have been bioluminescent in some way?

Corey: In some way, but it seemed as though whatever was occurring with it mentally was causing this to happen.

David: Hm.

Corey: The other being gave me the creeps immediately.

It had very sharp needle teeth.

The skull looked sort of like a rhesus monkey-shaped skull.

We jokingly, later on, were calling them “sea monkeys”.

But as its body went down, its ribs were real fine ribs, like in a snake.

And it went down and tapered down until it turned into this long tail that looked sort of like an eel's tail. That's the closest I could relate to something that we've seen on Earth.

David: Now, you mentioned that you had an uncomfortable feeling around this being. Could you be a little more specific about what you felt?

Corey: I felt like terror in the pit of my stomach. And there were a lot of odd-looking beings around. So, not being prejudiced . . . I mean, something actually was not right.

And I leaned over to Gonzales. I said, “Does that aquatic being give you the creeps?”

And he stopped, and he reached in his jacket and pulls out a smart-glass pad.

He sits there, accesses it for a moment and then hands it to me.

And then I take it, and I look at it. And it is a report during the Korean War era of a bomber that was on a routine mission when it had mechanical issues and they had to end up ditching in the ocean.

But the crash-landing was successful, . . .

. . . as the occupants of the plane, which was over a dozen, were able to gather supplies and deploy rafts, and send off a Mayday signal.

So they were just sitting floating in these rafts, waiting to be picked up and rescued.

What they reported next is that they started to separate, so they put out their oars, and they were trying to bring the . . . there were three rafts.

They were trying to bring the three rafts together to help increase their chances of survival.

As they were doing this, they saw a human figure leap out of the water, grab one of the men by their life vest . . .

. . . and pull him into the water.

And then it was out of the water bobbing up and down, trying to pull him under water, but it couldn't because of his life vest.

Right after this occurred, they heard screams coming from the other raft.

And the raft I'm giving you the point of view of is the one of the captain of the plane and his second-command were on this raft.

And once they saw another human figure jump up and grab a person and pull him in the water, they figured that they were under attack from some divers.

So they drew their weapons.

And sure enough, they started leaping out of the water at them.

And they opened fire, and they killed three of them.

And they were this being that gave me the creeps – the one with the eel tail.

David: So this would have been very shocking for the soldiers, obviously. They're encountering something that's clearly an intelligent life form, but really nothing like a regular human being at all.

Corey: Yeah, they were sea monsters to these guys, basically.

David: Right.

Corey: So what occurred is that they stayed in back-to-back defense until they were rescued some hours later.

And two of the dead beings were pulled back in the water by their comrades, I guess

you would call them. And they [the solders] grabbed the shoulders of the other one and pulled it all the way up, so they would have something to show.

And when they were rescued by the Navy, the Navy confiscated the being.

And the final report that went out was that the men were delirious after being in frigid waters all night and after being attacked by sharks.

David: Why do you think these beings would immediately be so evil towards humans if we live here?

Corey: Well, these are aquatic beings. They've grown up in an aquatic environment. They do not . . .

Interfacing with them is very weird, because you get different pictograms from them – a totally different frame of reference from being an aquatic being.

They are here to study aspects of the ocean.

Not only could they care less about us, and what we're doing, they cannot stand us, because they see us as polluting the ocean and not living in balance with the environment.

And we're affecting their program – the program that they're doing under the ocean – their genetic program.

David: And what is that exactly? Do they consider Earth their home?

Corey: No, . . .

David: Do they feel like they belong here?

Corey: . . . but there are so many different types of life developing here.

You know, when I talk about the 22 genetic experiments, I'm just talking about the humans.

There are other things in the ocean that are very important to other beings from other planets. And these aquatic beings are not very happy with the way humans have treated the ocean.

And what I was told is that the last thing you ever wanted to do was accidentally happen upon one of their experiment zones, because if you are, they are going to

attack with extreme prejudice. They do not like humans at all.

David: Experiment zone, okay, but what are they experimenting? What is the experiment?

Are they trying to create life there? Are they breeding something in the ocean?

Corey: They're studying and managing the development of aquatic life.

They not only learn about other aquatic life in the universe, but they're able to do genetic experiments and create different types of life that they then study to see how they fare in our environment.

You know, some of them they will give certain abilities to, but where they gain here, they lose here. And they don't survive in our ecosystem very well.

David: Why wouldn't the beings try to work out some kind of a treaty with us or make an agreement of some kind? Why would they just act in a shoot-first, ask-questions-later kind of fashion?

Corey: They've been here doing experiments in the oceans way before we were bipedal – walking around.

David: Hm.

Corey: I'm sure they would much rather have had an aquatic life form become the dominant species on the planet, but that just wasn't the case. It was a mammalian one.

This is a mammalian experiment that mainly was established.

But our oceans are so diverse that they cannot ignore the opportunity to take advantage of that diversity and genetic diversity to create new types of life and to learn more about their own type of life.

David: Did both of these beings have some kind of water around them?

Corey: Yes.

David: Okay. And was it the same kind of invisible cylinder thing?

Corey: Yes. I asked Gonzales about this. Basically, I was asking, “Do we all have that type of atmospheric assistance?”

And he told me, “This station is incredibly ancient and incredibly intuitive and intelligent.”

He said the minute you are brought on, I mean, just instantaneously, when you're brought into this ship, no matter where you've come from in the universe, even if they have no idea what your environment is like, a field around you appears that gives you your exact atmospheric and barometric pressure that your body's used to.

David: Hm!

Corey: And it's invisible. No one can see it.

So I was told that every being there was being provided some sort of atmospheric assistance.

David: So obviously, there's something that's building up here. You're seeing these aquatic beings.

And you mentioned that you and Gonzales were in the horseshoe-shaped area.

Corey: Right.

David: Is everybody in the same horseshoe, or did you have some sort of chair that was more prominent?

Corey: No, it was just like all of the others.

David: Okay.

Corey: And the three chairs were empty, and Gonzales stopped in front of the chair. And I looked at the chair, and I said, “So, are you in the chair today, or am I in the chair today?”

Because that's . . . When you sit in there, that's when you're communicating with the rest of the group – like giant telecommunications kind of thing.

David: Right.

Corey: When I asked him that, he kind of smiled, and said, “No, you're up there.” And he pointed up to the circular stage.

David: Hm.

Corey: And immediately, I felt this big lump in my throat. And all the other chairs are facing that one central location.

David: Were you concerned?

Corey: Yes. I had no idea, not only about what was going on, but about what to do.

And he said, “All you really have to do is walk up, stand on that stage, and think to yourself, “I'm ready.”

He cracked a joke. He said, “Don't worry. How could a meeting between the Guardians and the Super Federation be a bad thing?”

David: The Super Federation, you say, is outside of time, but this seems to be a very unusual thing, nonetheless.

Corey: Well, the station is outside of time. These beings don't stay in the station all the time.

David: Okay.

Corey: They're going back to their local galaxy or star system.

David: But it's not normal that they would get to talk to the Guardians, correct?

Corey: No.

David: How often do you think they would have the opportunity to do this?

Corey: I don't know that they EVER have.

David: Really?

Corey: Right.

David: But yet, you're saying that – to go back to some history from our show – that the Asteroid Belt was a planet that blew up half a million years ago.

That allowed these beings to come in here. It took down a protective grid, and it allowed them to start doing genetic experiments here.

So you're saying that they might have had half a million years to do genetic experiments without ever hearing from these Guardians before?

Corey: Yes.

David: Really?

Corey: Right. Not directly.

David: So this is like THE . . .

Corey: Gonzales had delivered a message to them from the Guardians, but they had never been in the presence of the Guardians.

David: Wow! So this would be the first time in an entire half-million-year history that they've been doing this that they would get a direct communication.

Corey: As far as I know.

David: Wow!

How did you know what to do at this point? When you walk out there, like obviously, you don't have any information in your own mind.

Corey: I went up, stepped onto the stage. I made a joke, also. I said, “What, we don't have to wear that stupid purple uniform that they made me wear last time?” They made me dress in this weird purple thing. I don't' know why.

David: Okay.

Corey: But we weren't required to wear anything in particular.

I went up, and I stood on the stage. And I looked out, and all eyes were trained on me at that point. And I was extremely nervous.

And I thought to myself, “Let's just get this over with.”

And I closed my eyes, and I made fists, and I said, “Okay, I'm ready.”

David: Now, these beings know that they're not in charge, right? They might call themselves gods to us, because they're doing all these genetic experiments, and they're appearing as if they were angels or gods.

But they know these Guardians rank higher than them and have some kind of control that they don't have? Would that be correct?

Corey: They're all aware of, yeah, the cosmic pecking order, but most of them had the same attitude of what they're doing was extremely important and shouldn't be interrupted.

David: Okay. Within the actual Earth part of this meeting, did you see anyone familiar?

Corey: Yes. When I was looking out, I saw the Earth delegation seat that I had sat in last time, and I recognized one of the Council of 200 members that I had dealt with sitting there with a scowl on his face.

David: Is this someone that would be recognizable to most people on Earth?

Corey: Yes.

David: Interesting. So he didn't seem too happy about whatever was going on.

Corey: No.

David: You step out there, and then what happens?

Corey: Much like when I was at the Lunar Operation Command, suddenly Teir-Eir and the Golden Triangle being appeared behind me. Very much the same thing happened.

And it got very quiet. And I turned and looked up at Teir-Eir, and he began moving his hand. And he told me, “Repeat everything I say, exactly as I say it.”

David: And this includes verbal delivery, intonation, that kind of thing?

Corey: Just the verbal part.

David: Oh.

Corey: I didn't have to move my arms around like he was doing.

David: Okay. So he tells you this, and then what happens?

Corey: Immediately, I begin to speak. The information is . . . I hear it in my mind, and then it, with almost no effort on my part, it goes down to my mouth and came out.

David: Were you aware of any of the content?

Corey: I was aware of a lot of the content. Some of it was over my head. I didn't understand it. But some of the content was blocked from me later on by the station. The station blocked . . .

Teir-Eir had me addressing some of these beings by name, and I can't recall the name.

And some of the beings . . . I remember seeing their faces when I'm there, but now, when I'm trying to recall what they look like, it's similar to what I've described in the past. It's like they have no face. It's just skin stretched across – no face.

David: Interesting. So what was the gist of the message that starts to unfold from what you were allowed to remember or authorized to remember?

Corey: Well, the gist of it was that Teir-Eir told the Super Federation that they would soon disband; that these 22 genetic programs were coming to an end; that humanity has a lot to overcome, but it is now our moment – our time.

The 22 genetic programs . . . They've been tinkering with our genetics AND our spirituality for many millennia.

And what the message that was delivered to them was: that humanity, now that they are a starfaring race, would now begin to manage our own genetics and our own spirituality; that we weren't going to have these beings managing us and us having to report to them.

David: What was the first thing that they said? Do you remember what the first greeting was?

Corey: They always greet you, “In the love and the light of the One Infinite Creator”.

But something that they said this time that was new was that they said, “In service to all; in service of the One.”

David: Hm.

Corey: They said that at the end before they left.

David: And before we get to the reaction, could you tell us a little bit about: what does this telepathic interaction feel like to you?

What kind of, if any, are you . . . Are you just flat and emotionless, or are you feeling something? What are you actually . . .

Corey: Oh, the opposite. I had tears running down my face. I mean, just . . .

And that happens often when I'm dealing with the . . .

When they're communicating with me, I'm getting not only pictures and words, but I'm getting sounds. I'm getting smells. And it is so overwhelming that emotionally, sometimes you basically bawl like a baby. You'll just have tears running down your face. It's just emotionally overwhelming.

David: I'm curious if there was a loving feeling. Do you feel some kind of blissful love as well?

Corey: Yes. Yes. It was a loving feeling, but it was also more of business.

They were there to discuss business. They weren't there to have a two-way conversation. They were there to deliver some information and then leave.

And that's exactly what they did.

David: So we're literally talking about all these different beings that have been using the Earth as a science lab, a genetics lab, a spiritual-experimentation research center for half a million years.

What's the reaction going to be if they're told they've got to pack up and get the heck out of here?

Corey: There was a HUGE reaction. And some of them were kind of yelling out telepathically.

Don't ask me to explain that.

And others were verbally speaking out and shaking their fists.

And the station took over. And people, the ones that were talking, they were moving their lips but nothing was happening. So it was sort of like something that took over.

Now, there were people there, beings there, that seemed very happy about the situation.

David: Hm! Some of the Super Federation beings.

Corey: Yes. And Teir-Eir had me basically tell them that there was going to be a restructuring of the Super Federation: that the majority of them were going to be

disbanded, removed. And a small number of them were going to work in concert with representatives from our local 52 stars, our cosmic cousins.

They were all going to form this Super Federation, and we're going to have a permanent seat.

David: Hm.

Corey: And that is a REALLY, REALLY big deal.

David: I know you've said before that we were not allowed to have an actual seat on the Super Federation. We didn't even have the ability to directly govern it.

That would imply, then, that this was something more that those people decided amongst themselves, rather than some cosmic law that they were told they had to follow.

This is like they're getting a decree now. Would you agree with that?

Corey: Well, it is all a part of cosmic law though. As the energetics change and humans begin to have more control over the genetic and the spiritual part of their experiment, then these other beings are pulled out of the situation.

This has occurred in star system after star system. They've been pulled many times out.

They became so upset that Teir-Eir had me tell them, “Remember the Ponce System”, which I have no idea what that means. But they all got very quiet and less animated at that point.

And I got a picture in my head. I saw Super Federation and Guardian assets in a war of some sort.

David: Hm.

Corey: But that's all the information I really could glean.

David: Okay. Well, we're just about out of time in this episode, so can we quickly cover anything that happened in this that you haven't already gotten through?

Corey: Well, once the meeting was over, the energy in the room came up. I mean, everyone was excited or the opposite of that.

And Gonzales ushered me out really quickly. He's like . . . get me out of the room before I got mobbed.

And as he was walking me out, he spun me around, and he said, “Do you know what this means?”

And I looked at him and I said, “We are not going to have a bunch of aliens pretending to be our gods?” basically is what I said.

And he looked at me and said, “They ARE the gods from our myths.” He said, “But yes, that means that humanity is now in control of our own future genetically and spiritually.” He was very excited.

He escorted me back to that area where I was dropped off. And I was picked up by a Blue Sphere, and off I went.

David: What does this really mean for humanity, for our future, with the Cabal, and with what they've been doing?

How does this all manifest as the future that we're going to see as real people here on Earth?

Corey: Well, I mean, basically, it was communicated that they were going to make it energetically impossible for the Draco to exist in our space.

David: Oh, wow!

Corey: Not only are they going to do it, but it's a part of this natural process that happens in the cosmos as the energy increases in this part of the galaxy as we rotate around the galaxy.

What occurs is that, as a natural process of what's occurring with energies traveling through the cosmic web, as the galaxy is rotating into a more energetic area of the galaxy . . . Remember, the cosmic web is made up of every star in our universe.

David: Okay.

Corey: Each star is connected by an electromagnetic filament tube.

David: Okay.

Corey: And it is through those tube connections that the portal system works. That's how the portals work. They go from star to star.

David: Okay.

Corey: As other stars in our local star cluster are moving through this energetic part of space, energy feeds in to the star. It goes in through the north and south poles. And some of it feeds out through that star.

And the residual energy feeds back through that cosmic web microtubule connection to OUR star.

Our star is going through something similar. And what occurs is for 1,000 years, as we go through this orbit and it loses that electrical connection, we have an energy that builds up in our Solar System that is not compatible with the Reptilians.

David: Hm.

Corey: It is like poison.

David: If they can't escape anyway because of the Outer Barrier, then would any of them survive this at all? Is there any way that they could survive this?

Corey: They can now travel through the Stargate System, but all of that is heavily monitored. They know how many hops you've taken. They know exactly where to find you.

What occurs is that, much like the Anshar created this time-space bubble that they put their city inside of, the same thing occurs with a lot of these Reptilians – the Draco and the insectoids. They form these pockets in time-space that they go inside of and wait out the energetic changes.

They're also in bases that are heavily shielded deep in the Earth.

So they're going to try to wait out this thousand years and then come back out and rule again.

What's going to keep them weak and in hiding . . . And humanity is going to be responsible for going down into the bowels of the Earth, finding these zones, and cleaning them out of the Reptilians.

In a conversation with Gonzales, he communicated that supergates are something special. And there's one just outside of our star system.

It is against cosmic law for any species to be banned from a supergate.

David: Hm!

Corey: Now, they can't ban the Reptilians from the supergate, but what they can do is poison the well in our star system to where they can't come into our Solar System anymore.

They will be coming and going from the supergate, but they will not have access here for a thousand years.

And when Gonzales said that, I had a weird look on my face. And he said, “Sounds biblical, doesn't it?”

David: Hm. Is the Galactic Federation involved somehow in poisoning the well for the Draco?

Corey: The Guardians are the ones that manage these energies. And they will help manage these energies, but they're not doing it to keep the Draco out. They're doing it as a natural part of cosmic progression.

David: It is interesting, Corey, to note that in “The Law of One” material, they talk extensively about Ascension. And they use the metaphor or term “harvest”, which, as I've described in “Wisdom Teachings”, shows up in the New Testament a lot.

So they use the metaphor of us being like fruit that has to . . . The whole tree has to ripen, if you will.

And then they say that these Guardians show up to make sure that “the fruit is harvested without bruise or blemish.”

So do you think that what happened in this meeting has something to do with them making sure that we are not blemished as we go through this Ascension process?

Corey: It sounded like in the past, when the Super Federation had reached that natural point to where they were supposed to leave, at times, they had refused to leave.

David: Hm.

Corey: And there had been conflict because of it. So it's a natural part of the cosmic law and cosmic progression for these beings to be reminded that it's time for them to move on to their next experiment.

David: Well, that's really, really amazing and very good news.

So, Corey, I want to thank you for bringing this to our attention and being that messenger. And I want to thank you for watching. This is “Cosmic Disclosure” with your host, David Wilcock and Corey Goode.

The Anshar and Red-Headed Giants Season 10, Episode 3

Cosmic Disclosure; The Anshar and Red-Headed Giants Season 10, Episode 3

DAVID WILCOCK: Welcome back to "Cosmic Disclosure". I'm your host, David Wilcock. I'm here with Corey Goode. Where we last left off, he had had a very interesting meeting with the Super Federation, and I guess you thought you were going to go home.

COREY GOODE: I did, yes.

DAVID: But that isn't what happened. Was it?

GOODE: No. No. Right after this meeting, I ended up in the foyer of the Super Federation base, and it was at that point where I was picked up by a blue sphere, I thought to bring me home. Instead, I ended up in that huge domed area of the Anshar temple complex where I had first appeared well over a year ago when I first met the Anshar. I appeared there. It was bustling. There were people in line to go into this one opening that went in towards the cleansing ceremony, and I immediately saw Aree and her sister walking towards me with huge grins on their faces.

DAVID: Corey, you are now calling her Aree, and you've also mentioned her sister, so could you please clarify why the name change, and who is her sister exactly?

GOODE: Aree, she's had me call her that from the beginning. I was continuing to use her full name, Ka'Aree. Ka, she comes from the house of Ka apparently, her and her sister. I was doing that to be able to tell who was genuine in saying that they had been in communication with the Anshar.

DAVID: It is interesting to point out that in the Law of One Material, they specifically mention the Ka as a name for the spiritual body that we all have. So, that is a direct Law of One reference, interestingly enough.

GOODE: Yes.

DAVID: So, who is her sister exactly? Could you tell us a little bit about that?

GOODE: Yeah. Her sister is very similar to her in just about every way. I'm keeping her name to myself for now. She's doing a lot of outreach to people right now on the surface.

DAVID: What specific types of outreach would you say that her sister is doing?

GOODE: Well, she's one of the people that are sitting in these egg-shaped chairs, that I've described before, that are networked together between their mass consciousness and ours. They reach out to us in dreams. Later on, I get to learn how to use these chairs a little bit more on my visit, and it's also somewhat of an entertainment for them, but they watch us, observe us, and give us guidance remotely from these chairs.

DAVID: Normally, if people have things appearing in their mind, we would call that schizophrenia or something along these lines. So, what is the dividing line between this guidance and a profound mental illness of somebody "hearing voices", quote, unquote?

GOODE: Usually they're not speaking to people in voices. What they're doing is, I'll just go ahead and describe... when you're in one of these chairs, you can use it to go to any gathering or place where there's just one person, and be in the room with them. You are basically above their shoulders and head looking down on the scene, almost like what people would picture angels doing. They sit there, and they observe conversations, or observe a person working, and if they think, oh, I could guide them in this way, this would make this much difference in the timeline and help here and here, then they do this kind of a thing, where they give the person a download, and it's like an information package that's compressed. Then it decompresses, and people just get this flood of ideas, and we call them downloads.

DAVID: And it appears as original thought without the people realizing where it came from?

GOODE: Exactly.

DAVID: OK. So, you meet Aree and her sister. Could you tell us what happens then? You said they're really smiling. Did you know why?

GOODE: Oh, yeah. It was because of the meeting I had just been at.

DAVID: OK.

GOODE: You know, they were very excited about it.

DAVID: So, what happens next at this point?

GOODE: Immediately they guide me to the corridor that leads out to that huge cavern where the Anshar city used to be. If you remember, the city was somehow removed, and put into this temporal anomaly.

DAVID: Right.

GOODE: There was one of the Anshar bus craft waiting for us. People were boarding it, and Anshar were boarding it, and there were already Anshar on board sitting.

DAVID: About how many were in the craft?

GOODE: More than 15.

DAVID: OK. So, it's pretty crowded.

GOODE: We take off, and then we head right into that temporal anomaly.

DAVID: What does it look like as you go into it? What do you see?

GOODE: Well, I didn't get to see anything, because it's like someone turned on this huge magnet next to my head, and my consciousness does this, I mean, I kind of pass out and fall to the side, and then I come right to immediately once we get through it. It's like just some sort of barrier that affects my consciousness. You can see all the cities laid out all along the sphere. The tops of the buildings are facing towards the center point in the sphere.

DAVID: What do you mean by the sphere? Is it a sphere of energy? Is it a cavern?

GOODE: It's a spherical energetic bubble.

DAVID: Oh, OK.

GOODE: Along the inside of the sphere is where all of the cities have been joined together.

DAVID: OK.

GOODE: So, we fly down into the Anshar city area, and we approach some of the huge domed buildings, and we land on top of one of them on this it's almost like a helicopter pad, but it's larger. It's on top of the building kind of on stilts. So, we disembark from the craft, and we all start heading to this area on the roof that was an area that you walk in, and then there were two oval holes in the floor that are sunk into the wall that go down like tubes. Each of them began to walk up and stand in those tubes, and go down. As we get closer and closer, it was my turn. I thought it was going to be like a slide, you jump in, and down you go, but I stood and there was a barrier that moved a little bit when I stood on it, and when I looked down, I saw the Anshar that went before me looking up at me. I saw this part of their face and forehead as they kind of disappeared. Then I went down. It was just like riding an elevator.

DAVID: Did you get any fear of heights or anything just to walk into a hole?

GOODE: Yeah. I had an uneasy feeling. Like I said, I thought I had the feeling, my brain was telling me that I was just going to drop.

DAVID: So, what happens as you go through this tube, and where do you end up at the bottom?

GOODE: Well, we end up at the bottom, and we walk out, and there's this huge area inside the dome where Anshar are walking around all over the place. They are wearing all kinds of colorful clothing that is obviously woven. It wasn't this high-tech type of clothing that I had seen prior. Anyway, we're walking through this group of people all bustling about going on their way to do whatever they were doing, and we see some of the people walking out and some of the people coming in, but it's through like a wall. It looked like people were just walking through the wall.

DAVID: Wow.

GOODE: We walked through, and there was a little sticking, kind of a stickiness energy, as we walked through, but we walked through, and we were in a bustling area of people walking around, people flying around like Superman.

DAVID: Really?

GOODE: The elders, the people who were much older, will fly around using the technology that they have to fly around like Superman. Everyone else was walking around like we would at a mall.

DAVID: Well, now is it a technology, or is it like telekinesis? Is it some kind of psychic ability they have to do that?

GOODE: It's a technology.

DAVID: Really? Well, it must have been impressive to see, I would imagine.

GOODE: Yeah, it was, because you would see people coming down and lifting just, I mean, like Superman.

DAVID: Why do you think only the elders were able to do this or allowed to do this or something?

GOODE: The elders, they looked different than the rest of the Anshar. I was told that it's not uncommon for fourth density and other types of beings as they age, they get taller and skinnier, and this apparently is what happens with them. They grow another

two or so feet, and they get very, very thin, very frail, and their skin gets even whiter, and they had wrinkles all around their lips and around their eyes.

DAVID: I want to point out something so bizarre, which is I had this call from Pete Peterson where he starts telling me about these Nordics that he had encountered when he was in there, and he said exactly the same thing, that they go through three growth phases. The third growth phase causes them to get taller and skinnier.

GOODE: Another thing that I saw that they wore is they wear an eye protection. Their eyes get very sensitive. We walked to a building that was a building for Aree's family group and the offshoots of her family group. They were all together in this big building. I was brought to the area where her family group lives. I was shown a room, a small room, that had been set up for me to sleep in. I was going to be there for a while.

DAVID: Wow.

GOODE: She brought me to the bed that was created for me, because they don't use beds.

DAVID: Well, hold on a minute. They don't use beds why? What do they do instead of sleeping?

GOODE: They do some type of cycle that lasts like 45 or 50 minutes every several days. They don't have a sleep cycle.

DAVID: They don't need to lie down when they do that cycle?

GOODE: They sit in the chairs.

DAVID: OK.

GOODE: So, on this bed, the first thing I see are three shirts, three pairs of khaki slacks, and a bunch of toiletries, just strewn out. The clothes look like they were from like JCPenney in the 1980s. It was blue, just regular, blue polo shirts, and khaki pants, no belt, and they had underwear, deodorant. So, I saw all of this, and I realized they were going to have me there a little bit longer than they ever had before.

DAVID: Wow.

GOODE: Sure enough, I ended up doing two sleep cycles when I was there, two full sleep cycles, so I was there probably about three days.

DAVID: Was this the size of like a small dormitory room, or did it have some space

to it? What was your room like?

GOODE: No. It was very small. It was probably eight feet by six feet.

DAVID: Oh, wow.

GOODE: But, I mean, I wouldn't spend much time in there.

DAVID: Obviously, you're going to need to eat something. So, what was the food that they provided?

GOODE: The food was all vegetarian, of course, a lot of raw vegetables, and a lot of interesting sweet cakes that they made out of vegetables that were really good.

DAVID: Would you say it's the best stuff you've ever tasted in your life, or was it just OK?

GOODE: To be honest, it was kind of bland.

DAVID: Really?

GOODE: Yeah. It was just, I mean, there was no seasoning. They were just eating raw vegetables, and they didn't eat that much, and they didn't eat that often.

DAVID: Did you get the sense that you were being fed the same things that they were, or did they have to modify for you?

GOODE: No. I was sitting, eating along with them.

DAVID: Where you were sitting, did it look at all familiar to what we would have as a cafeteria table or something?

GOODE: Yeah. It was a cafeteria.

DAVID: Really?

GOODE: Right. They had a commons area, a large commons area that the roof was higher. It was about two stories high. Then they had private areas where they had private areas where they could have their own kind of like a room, but they didn't really spend much time in them.

DAVID: So, if you need to eat more often than they do, would they bring you to this cafeteria, and then not have food, or would they always eat with you?

GOODE: I only ate three times.

DAVID: Really?

GOODE: Yeah. I mean, you've seen how I am anyway since I went over to being a vegetarian. I eat one, maybe two very small meals a day, very small. The food was very high in nutrients, obviously, because, I mean, you immediately felt a pickup from the food--

DAVID: Wow.

GOODE: --when you ate it.

DAVID: So, it was energized somehow?

GOODE: Yeah, but it tasted like normal vegetables.

DAVID: At some point, you're going to have to be asking yourself, they bring me into this bedroom, they give me these weird, old clothes, I would imagine you would be turning to them, and saying, guys, I thought I was going home. What's going on here? Why do I have to be here long enough to sleep over? What's your agenda here? What's happening to me?

GOODE: Well, Aree told me that I was being given a gift basically, that I was being allowed to spend time with her family group, and also go through the preparations to go with them to this base outside of Saturn to meet this council at Saturn as they call them. So, I got to spend a lot of time with these people. I was told not to touch anyone, to keep my distance.

DAVID: Which is exactly what Pete Peterson said too, interestingly.

GOODE: Right. When I first arrived, they stood a good distance away, and weren't being that friendly, but they saw Aree, when I first got there, she took me by the arm, touched me, and took me by the arm, and guided me to show me where I was going to be staying. After that, it had an impact on the people. They started getting closer and closer, started asking me questions, talking to me. They were very curious about the surface world.

DAVID: Let me just ask you one thing that might clear some misunderstandings up for our audience. People might be inclined to think that these beings are inter dimensional, and that, therefore, they would be like ghosts to us, and, therefore, if you were going to go there, that you would have to be like a ghost.

GOODE: These are not higher dimensional or different dimensional beings. These are us from the future. They traveled back into time to preserve their timeline. They are flesh and blood just like us. So, after the first day, the children and the other people

started coming closer and closer in, spending time with me, close enough to where I could touch them, but I didn't. At some point, there was kind of a parting of the waves, people were getting out of the way, and I look up across the room, and there's Gonzales. He looks very haggard. He looks beat. He sees me, and he starts to walk across, and I meet him, and he just drops into one of the chairs. I go over to one of the chairs, and I sit in it, and I mentally guide it over the way they showed me how to do over next to him, and asked him, what are you doing here? What's going on?

DAVID: So, you can steer the chair around just with your thought and move it to different areas?

GOODE: Easily.

DAVID: So, you zip over to Gonzales's chair, and then what happens?

GOODE: If you remember, Gonzales got to spend a lot of time with the Anshar. He was actually staying with them in their city at one point.

DAVID: Right.

GOODE: As a part of the work he was doing while there, he was working with this race of giants, a red-haired, six-fingered race of giants. He was starting to make some headway with them when he was basically kicked out by the Anshar for his behavior.

DAVID: Now, we have enormous numbers of records of giant skeletons that have been found all over the Earth. Are those red-haired giants related to them somehow?

GOODE: They are.

DAVID: In what way?

GOODE: Well, let me just go ahead and tell you what occurred.

DAVID: OK.

GOODE: Gonzales said that, for the better part of a year, if not more, he's been working with the red-haired giants. He'd been trying to get them to accept some of the healing technologies from the Mayans. However, they have been refusing any type of help from the Mayans, thinking it was some sort of leverage for them to say that Secret Space Program Alliance and the Mayans have, at times, rescued red-haired giants from various places on the planet, and brought them to this sanctuary. We don't want the healing until you can get our royal family, basically, that's being held by the Cabal in a base.

DAVID: OK. Well, there's kind of a lot of questions that that raises.

GOODE: Yeah, and it doesn't make sense for them to make a demand like that.

DAVID: I was under the impression that the red-haired giants died off completely. There's none of them on the surface of the Earth now.

GOODE: There are none of them on the surface of the Earth now.

DAVID: So, then why are we talking about them as if they still exist?

GOODE: Because they do.

DAVID: OK.

GOODE: At one point, they controlled a huge area of North and Central America. These beings are genetic creations of this pre-Adamite race, you know, that was in Antarctica. They created these giants to manage humans, their slave population of humans. After the cataclysm occurred, and the pre-Adamites were basically wiped off the face of the Earth, or so we thought, these giants had to fend for themselves. During this time, they were eating humans. They were causing a lot of problems. After a number of years, after this cataclysm when humans started to organize again, they started going out in hunting parties and killing off these giants. So, the giants had to go underground, and they went deep, deep into the bowels of the Earth into some of these ecosystems deep in the ground that we've told you about, or that we've talked about on "Cosmic Disclosure" before.

DAVID: So, what we're then seeing is, we have American Indian tribes going after the red-haired giants. We have people in Europe and Asia going after the giants, and they retreated to underground areas?

GOODE: Caverns with ecosystems. Their health suffered, because they didn't have the nutrients they needed, the sunlight. They were eating what was down there, and it was affecting their health not in a positive way. They were getting thinner and thinner. They hunted one species, a humanoid species, that lived in the inner Earth into extinction, because they became very fond of the taste of them, and they wreaked havoc on a few other of the beings that were down.

DAVID: Would they look just like one of us only larger, or is there something unusual about the shape of their face or their head?

GOODE: Yeah, they have big foreheads, big thick jaws, double rows of teeth. They would not fit in and look like just a large human.

DAVID: So, even if you shrank them down to our size, they'd look very, very different?

GOODE: Right.

DAVID: Interesting. So, they live in these underground areas. They're essentially wiping out other underground populations of humanoids you're saying.

GOODE: Right. Well, what finally ended up happening in their history is that some of their royal caste helped them start to get it together, as they say. They were a mess when they were refugees under the ground. So, they found areas that would sustain a small population. They controlled their number, their population numbers, and some of the royal caste and religious caste of these giants went to various stasis chambers, and put themselves into stasis.

DAVID: I'm just curious now about when we look at the records of their civilization in the Americas, we find the so-called mound builders, and there's always these dirt mounds that are kind of pyramid-shaped. People would dig into the mounds, and they'd find giant skeletons inside. So, the giant skeletons and the mounds are always one in the same thing. So, it seems that these people had some desire to keep building pyramids. Why do you think that is?

GOODE: Well, the giants were the ones that were supposedly directing humans, or controlling humans, when they were building out the infrastructure and cities for the pre-Adamites. So, maybe, I'm speculating, these giants were, I guess, the foremen on these jobs, and they were making sure that the human slaves were completing the jobs.

DAVID: The mounds that people dug into, we never really saw any type of written books. How literate do you think they were? Did the flood affect them so badly that they--

GOODE: Yes.

DAVID: --lost a lot of their language?

GOODE: They lost everything.

DAVID: Really?

GOODE: Right. They were in the same boat as the humans. Everything was lost.

DAVID: So, then how would they know about these caverns under the ground if they're essentially now illiterate?

GOODE: Well, they were forced down in. They were forced to go in, and explore and find these areas.

DAVID: OK.

GOODE: What finally happened is they got their people together, the giants, and they said, OK, we have these little pockets of areas that will sustain this number, so maintain these numbers. We're going to go, go into stasis, and that way we will be as strong and as powerful as we are now, and when we pop out during the time of these great energetic changes, we will be more useful. But what happened is there was over 130 of these beings spread out in these stasis chambers, and mostly what has happened is the Cabal has located these stasis chambers, awakened the giants, and then moved them to prisons and inside bases.

DAVID: Well, I thought you said before that when people tried to access these stasis chambers, they would get stuck, and they wouldn't be able to move through. There's like a gravitational field. So, how could the Cabal actually awaken anyone? I thought nobody could get in there.

GOODE: Well, they can't get in, but they have harmonic ways of turning off and controlling that technology.

DAVID: Oh, really? Interesting.

GOODE: They found enough of them, broken and working, they know how they work very well. They know the mechanics of them. These sanctuaries, the people had survived physically, but mentally, they were completely checked out, these giants. He said, surprisingly, he was able to relate with them and had more headway with them before he went through his transformation, because they were so psychologically messed up and traumatized that he can't reason with them hardly. Now, and he was telling me this as he was in the chair, he said, now, after he's gone through this transformation from what he was before, that they just will not relate with him at all.

DAVID: So, let me see if I got this. They go to sleep. They think they're going to wake up and be kings over their people, 130 of these you said, but they wake up and now they're prisoners. So, that's got to be very jarring for them, I would think.

GOODE: Yes.

DAVID: Do they experience it just like they knitted together two points in time, or do they feel like they were gone for a really long time?

GOODE: The ones that were in stasis, it's just like they went to sleep and woke up.

DAVID: Wow. So, the sudden loss of power you're saying has caused them to be very, very distraught.

GOODE: Well, those are the ones that were in stasis. The ones that were living generation to generation in these ecosystems deep in the Earth, they were the ones that were the most traumatized.

DAVID: Oh.

GOODE: Gonzales said that he was just unable to relate with them. He kept saying, we can help you. We can bring you these healing technologies. They're like, no. First, you bring us our royal families and others who are in, basically, prison, Cabal prisons, then we will accept the healing. You know, that makes no sense whatsoever, but they are just gone up there.

DAVID: The people that are living inside the Earth, that have been there the whole time, do they have any awareness of what our civilization is like on the surface, or are they so cut off that they really have no idea who we are when we would come in and capture them, basically?

GOODE: Most of them are cut off, but some of them would do recon missions up to the surface from time to time, and have encounters with usually human military. So, they had an idea of how out of control they were now.

DAVID: Did they have any communications systems that allowed them to be able to talk to different groups in different areas?

GOODE: I was told that they were utilizing some ancient technology below ground that allowed them to communicate here and there. Gonzales was really frustrated. He kind of got a twinkle in his eye when he told me that these giants were not relating with him anymore after his change. He looked at me, and he said, how would you like to go down there? I was like, not my job, buddy. That's your job.

DAVID: Go down to where these giants are?

GOODE: Right. He said, come on, this would not be the first time you had a meeting with someone that wanted to eat you.

DAVID: Where were these sites? Did you get any specific information about where were these underground sites that they had relocated to?

GOODE: Yeah. It was in the Anshar area. As a matter of fact, Gonzalez found out about them because the Anshar were being secretive and going off into this cavern area where there was a solid wall they were walking through, and he found a way,

after weeks, to scurry around and find a little hole that he could peek through to see where they were going to. He saw the Anshar meeting with red-haired giants that were just moaning and crying and sounded horrible. It was soon after that, that he was, I guess, read in and started to meet with them before the Anshar kicked him out.

DAVID: So, we are essentially out of time for this episode, but I'm interested just to get your speculation as to how these giants fit into the overall picture of ascension and us transforming into beings like the Anshar. What do you think is the reason why you're being shown this stuff?

GOODE: The reason I think it's occurring is that these beings, even though they're created and they did evil things, karmically we're all connected. Just like the Blue Avians were wanting to move to the next octave, but they couldn't because we were acting like a parachute, because they had karmic ties to us, that's kind of the same thing going on with all these other beings. We all kind of lift each other up and move together, or no one does.

DAVID: At some point, you and Gonzales must have finished this conversation about the giants. So, what happened next?

GOODE: Aree and her sister visited with Gonzales and I for a while. Some of the Anshar gathered around us were keeping a little bit more distance from Gonzales than they were from me at this point. At this point, our sister said, it's time for us to prepare for meeting the new Guardians. Everyone was very excited. So, we started winding down the conversation. Some of the elders invited me to come back and stay for a longer period of time later, months from now.

DAVID: What did they call you when this was going on?

GOODE: They called me the Hanush.

DAVID: Really?

GOODE: Yes.

DAVID: OK.

GOODE: Everyone kind of got together in the commons area to say goodbye, and we said goodbye. We followed the same route back to get onto the Anshar craft on top of the domed building, and then we flew out of the anomaly.

DAVID: Did anything else happen before you actually went home?

GOODE: Yes. I didn't actually get to go home--

DAVID: Oh.

GOODE: --still. We landed the Anshar bus craft, walked back into the temple complex, and, again, there were even more lines of people heading into the tunnel system that led back to where the cleansing room is that I described before. Aree and her sister walked me and Gonzales past the line. We walked past everyone, walked up to the front, and we did the cleansing ceremony. I folded my clothes, and I was going to put them next to Gonzales on this pedestal that was in a half moon, semi-circle configuration in that room, in the cleansing room, but Aree had a satchel over her shoulder, a light brown satchel, and she opened it up, and held it out for me, and indicated that I should put my clothes in there. I was looking around, and I saw representatives from all seven of the Inner Earth groups that I had met the first time I was there.

DAVID: Now, did they wear the same kind of amulets as when you first saw them?

GOODE: Yes, they were wearing the amulets and white tunics.

DAVID: Interesting. Well, that's all the time we have in this episode. I want to thank you, Corey. It's very fascinating information. I want to thank you for watching. This is "Cosmic Disclosure". I'm your host, David Wilcock, here with Corey Goode.

Alien Tech at the Vatican Season 10, Episode 4

Cosmic Disclosure; Alien Tech at the Vatican Season 10, Episode 4

14 Mar 2018 [blocked images]

David Wilcock: Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock. And here again with me is Emery Smith, a friend of mine for the last 10 years.

I've been leaning on you for a decade to do this, and you finally have. So, thank you, Emery. And thank you on behalf of all people in the world who want freedom and Full Disclosure.

Emery Smith: Oh, thanks for having me, Dave.

David: We were actually driving in the car, and we were talking about the bodies that you'd autopsied, but then you told me something in the car that I think sheds some deeper light on your experience.

And I'd like us to go into that part now, even though I think it's farther along in your career.

But it helps to establish a fundamental truth, which is that insiders, typically, when you get a real one, they have lots of different, cool things that they've done.

So tell us about the Vatican.

Emery: Oh, the Vatican. Yes, yes.

So a private organization went to the DoD *[US Department of Defense]* and the mil *[military]* labs I was working at, and they needed some technicians and some scientists to go to the Vatican to look at their archives, because they know that they had some information on a craft that was taken in New Mexico.

David: So there had been a UFO . . .

Emery: That was shot down.

David: Oh!

Emery: Yeah.

David: And it was a recent one.

Emery: Yes, very recent. And they took this craft . . .

David: Why would they shoot it down? Was it hostile? Did it do anything bad?

Emery: No, no, no, not at all.

David: Oh.

Emery: No, it just got too close to some of the weapons up there . . .

David: Oh! Okay.

Emery: . . . and from what I heard, from the debriefing.

And I don't know where it crashed. I just know where it was at.

David: Do we know anything about what this craft looked like or what kind of occupants they found inside?

Emery: No, there were no occupants that was mentioned, but the craft did look like a tetrahedron.

The best way I could put it is: make a tetrahedron out of PVC pipes.

David: Really?

Emery: Yep. And about eight feet in diameter.

David: Uh!

Emery: Yeah, and it has a light in the middle of it.

David: Really?

Emery: Yes.

David: And this was like a robotic drone?

Emery: It always stays centered. Ah, it could have been. But then again, a lot of these craft are conscious, actually.

David: Hm.

Emery: And it can . . . Every now and then, it'll strobe. And then it'll fill up the spaces so you can't see through it.

David: What will fill up spaces?

Emery: Like, you know, I just said it was an empty tetrahedron, like made out of PVC pipe?

David: Right.

Emery: So you could see through it, and you could see the light in the middle.

David: Oh!

Emery: Uh-huh. Yeah.

David: What color was the orb of light? Do we know?

Emery: It was blue, but it was very small, like probably three inches in diameter.

David: Wow!

Emery: Yes.

David: And the tetrahedron itself was white?

Emery: It was . . . The outside of it was like if you made one with PVC pipe and it was pure white, and it was seamless.

David: Wow!

Emery: And if you got too close to it, it would actually fill in a space of . . . that you could not see into it.

David: But I still don't know if I understand.

Emery: Okay. So if you have an empty tetrahedron that you can see through, and we're only talking about the outside lines, okay?

David: Okay.

Emery: So you could see through it, and you can see this ball.

David: Oh.

Emery: And if you get too close to it, it'll actually go solid.

David: This tetrahedron goes solid?

Emery: Yes.

David: Really?

Emery: Yes.

David: And then what does it look like?

Emery: It's just white. It's just white.

David: Wow!

Emery: Yeah, pure white.

David: So this appears to have been some kind of drone. There were no occupants in it.

Emery: There were no occupants, but it doesn't mean . . . because that white light could be some sort of consciousness.

David: Or a being. Right.

Emery: Or a being.

David: Yeah.

Emery: So you cannot . . . Any time you see light, you have to think being first and then go from there.

David: So you're saying, if I'm getting this right, that the Department of Defense had this craft, or whatever it is, get shot down in New Mexico.

And they're drawing a blank as to what it is or where it came from.

Emery: Yeah. I don't know where it was shot down. I just know it was stored in New Mexico, . . .

David: Oh!

Emery: . . . because that's where I was at. But it was a first of its kind, so they had . . .

David: They have a very robust idea of what normally would crash, correct?

Emery: Yes.

David: They have an extensive catalog?

Emery: They have an extensive collection, I will say.

David: Yeah, ha, ha. Okay. But this skewed the charts in some way.

Emery: Yes. Yes, it gave off different, I guess, frequencies or something that they were amazed about. And it didn't show any aggression or whatever after it was shot down.

And it was still obviously operational.

David: And you say that this craft was in the category where it appears that the material itself is a life form somehow?

Emery: Well, I don't know about THAT, because I wasn't in on that part. All I know is that ball on the inside had energy.

David: Okay.

Emery: So energy and light always could mean life.

David: Okay. So what did they decide to do about this craft? If they don't know what it is, they don't know where it came from, what kind of resources can they draw upon at that point?

Emery: Well, what they do is they form a team, and they do a big background check around the world, because there's other catalogs in other countries and other religions.

And, of course, the Vatican has always been a huge database. It has a huge archive of many things: artifacts and things they have found from space and have collected over many, many, many, many years.

And they have an underground base under the Vatican.

So two scientists and myself were deployed to that area to the Vatican to an undisclosed location in the Vatican. And we took an elevator down about seven or eight floors.

David: Hm.

Emery: And that's kind of how it all started. We got permission from the Vatican. They set it all up.

We're just contractors going there to collect any type of information that would be similar to this device.

David: So is it common that there is interagency cooperation?

Emery: Yes.

David: Okay.

Emery: Usually for exchange for favors.

David: Now, you are an Air Force veteran, right?

Emery: Yes.

David: And we've often heard from various insiders that there's like an Air Force wing of the military-industrial complex and a Navy wing. They kind of broke off after World War II . . .

Emery: That's true.

David: And they've grown into these totally separate industrial complexes.

Emery: That's very true.

David: So would you estimate that most of your experience is in the Air Force side, because that's where you started, or . . .

Emery: Yeah, for this particular thing, I would say so, but they still work together when they have questions.

David: Okay.

Emery: They're not banging heads.

David: Right.

Emery: But they do like to keep their secrets together, because the more they can show the government, the more money they can get at the end of the year.

So if I have some really cool things that I've collected this year for this corporation, this mil lab or Air Force mil lab, then we get more money.

And so they don't always share the secrets of what they're doing, but they do always work together to figure out things that they can't figure out. They work always . . . They're very compliant with that.

David: So I think the military budget, even on-the-books military budget, recently was like in the neighborhood of $864 billion – the ridiculous $700 toilet seats and that kind of thing, and the little nuts that cost $65.

So the idea being that the military budget has a lot of room in it for off-balance sheet expenditures.

Emery: That is correct. You know, you could get a toilet seat for $700. And they WILL go to Home Depot and buy it for $2.00. And they'll buy 2,000 of them. And then the rest of that money goes where?

David: Well, apparently, you guys are fighting over it is what you're telling me now. It's like a healthy . . .

Emery: It is a competition.

David: Competition.

Emery: But from my experience, I mean, and I'm not one of the executives there by far or their financial advisers, but just from what I heard from some of the higher upper-class people in there that they usually always get about the same.

David: Oh.

Emery: So it's not this . . . They're not beating them by billions of dollars.

David: Right.

Emery: And it is actually not billions, it's trillions.

David: Right, when you encounter all the other ways that money is being generated.

Emery: Correct.

David: So if we have this craft that comes down, and they don't know what it is, just in a very general sense, if you can speculate – and I understand you might not have definitive knowledge, but I'd like your speculations. It's going to be probably better than mine.

How often do you think this kind of stuff is happening?

Emery: Daily.

David: Really?

Emery: Yes.

David: DAILY? There's crashes of UFOs daily?

Emery: Well, they may be . . .

David: I would not have expected that.

Emery: They're actually identified, because when we say "UFO", we're thinking . . .

David: Vehicles.

Emery: Vehicles. But there ARE a lot of vehicles that are recovered from space, or shot down from space, and then recovered and brought back too. And they're not always, of course, inhabited at all.

David: Right.

Emery: And a lot of these things too, actually, it's like the Trojan horse. They want us to bring this in here, so we can learn about good technology and can reverse engineer something.

David: A positive Trojan horse.

Emery: Right – a very positive Trojan horse.

David: Not like an AI infestation . . .

Emery: No!

David: . . . that swarm over the planet.

Emery: No, not at all.

David: Okay.

Emery: So, and that's what . . . It's so exciting that the scientists do realize that. And a lot of the corporations also learn about that.

The sad part is once they figure it out, it's forever for it to come to the public for us to use to help make our lives better.

David: All right. I'm still a little reeling here, and probably they are too. Every day? EVERY DAY?

Emery: Yes, every day.

David: Wouldn't there be people filming this with their phones? Wouldn't there be incident reports and . . .

Emery: Well, I think there are a lot of abnormal things people are seeing on YouTube and all these things.

David: Okay.

Emery: And probably 90% of them are fake disinformation . . .

David: Right.

Emery: . . . or fake alien reproduction vehicles that they'll fly by just to make people fearful or whatnot. So there IS this happening.

But you have to understand, this doesn't happen usually over a major city. These things are usually . . . now are being shot down in XO atmospheric areas and brought back and then brought back very carefully to the surface here.

David: Okay.

Emery: So it's not always like you shoot a jet down, and you see it streaming down, and kaboom.

David: Right.

Emery: You know, that's very rare.

David: So in a sense then, if we could liken this in some ways to a war, they are going to be very meticulous about not leaving any vehicles on the battlefield.

Emery: Oh, you will not see any vehicles on the battlefield.

David: Right.

Emery: No.

David: So whatever happens, they bring it in . . .

Emery: It's intentional

David: They take a look.

Emery: Right.

David: Right. So that would then mean, I would guess, that there probably is some sort of diplomatic relationship with various ET groups. And then when people try to get in and breach that agreement or that contract, if you will, that's when problems arise? Would you say that's true?

Emery: Yeah, just like with Eisenhower. I mean, there were some nice, good things happening with the meetings. There have been many presidential meetings with certain ET civilizations.

And I think what happens is just because the president shakes hands with an extraterrestrial doesn't always mean that the president's military-industrial complex is also part of that contract.

David: Right.

Emery: And that's the problem. So we did . . . Hm . . . Our contract is void and null now because of this problem.

David: Wow!

Emery: Yeah.

David: So if you could again speculate – and I understand that this is purely off the top of your head . . .

Emery: Sure.

David: . . . or maybe you have some briefings, I don't know. If you're saying that one a day on the average is being recovered, that would be 365 per year, how many of those per year might you think would be unconventional or otherwise requiring a deeper degree of research for them to understand?

Emery: Well, let me get one thing. When I say collecting one a day, it could be a piece of equipment.

David: Ah.

Emery: Okay? It could be an archaeological find, or it could be something from space that they have collected. Or it could be something we shot down.

David: Wow!

Emery: So those are the . . . When I say that, that's how much data we are getting in on these devices EVERY day.

David: Wow!

Emery: So that's why it's growing so much, and so much money is going into these projects, because it's an unlimited amount of . . . We can't keep up with what's happening.

So they're starting to store these things. And then certain things, certain organizations, are buying massive amounts of satellites to track these things with neutrino light detectors and forming their own ways of getting this technology as well, instead of just the military-industrial complex.

David: I want to run something by you, and it annoys me, okay? So this is a question that I ask out of some degree of anger.

But it very much upset me when I was talking to my insider, Jacob, where he was describing the redundancy of technology. That in some cases they found so much of a certain type of technology, like for example, ruins on the planet Mars, just in case we ever get there in the future, they've actually bulldozed over ancient sites and buried them, because they feel like they know what's there, and they don't want it to be so easily discovered.

Have you ever heard of things like that going on?

Emery: I've heard of things like that going on here on Earth.

David: Really?

Emery: And I wouldn't pass it by anyone else that that's happening on Mars as well.

David: So do you think then that the technology that they have in these secret programs is so immensely vast that in a lot of cases they can bring things in, and it's not really going to advance our knowledge that much?

Emery: It will always, usually 90% of the time, advance our knowledge, yes.

David: Oh, really?

Emery: I mean, if they bring any type of equipment, or bodies, or craft, or whatever it is, we are still learning. We are the medieval people here trying to get a hammer and a wheel made.

So all these little bits and pieces all still fit together sometimes. So you might get a piece today and a piece two years from now, and like, "Ah, here's the two pieces. Great!"

David: Oh, wow.

Emery: And that's why it's important now that a lot of the military-industrial complexes and the military, and the private organizations, are now teaming up for things they can't figure out, because they'll work on a project . . . they used to work on projects for maybe five or 10 years without asking for help.

David: Wow!

Emery: It's kind of like the husband and wife driving around, and the husband is not going to ask and stop for directions whatsoever, because we're too stubborn.

David: Right.

Emery: So that's kind of where it's at now, but it's different. So they're sharing information. They're sharing data but very limitedly and very carefully.

David: It does seem to me as if the intellectual capital, the, if you will, financial and informational value of having more skilled employees working on this stuff, it would appear that once we have disclosure, and we can get a lot more, potentially tens or hundreds of millions of people more, working on all this stuff, that we will quantum

leap even beyond wherever they are now so much. That's what I would think.

Emery: Yes. Yeah, there's still rules, and laws, and regulations universally, but as far as technologically, we will overnight transform the world within like a week.

David: Right.

Emery: I mean, you'll be able to 3D terraform houses in any place 50' above the Amazon so you're not destroying the trees.

David: Wow!

Emery: It'll be cities will be put up everywhere. I know even our government has contacted me to orchestrate and architect a special city here that's self-sustainable, that's off-grid, has its own communications, its own electric, and all this stuff, because they're preparing to do this model everywhere.

David: Wow!

Emery: And our government is in full support of that, especially POTUS.

David: This doesn't make me think that we have any overpopulation problem at all. If you have people who can become skilled workers, we want more of them. We should be colonizing. We should be going out and developing inside moons, developing inside other planets and on the surface of these planets.

We don't need to get rid of people. We need more people.

Emery: Right. We will need more people, because once the intelligence and all of this information comes out, then everyone's going to be really smart really quick. So then people will be training immediately on this stuff.

And the secret science behind how to do all of that will be revealed.

David: Wow!

Emery: And as soon as that's revealed, you're right, it'll be like taking a flight from LA to New York, but to the Moon or Mars, to help colonize.

David: Yeah.

Emery: And it'll be that safe and that easy.

David: So I want to make sure we get into the Vatican.

Emery: Okay.

David: You go down this elevator.

Emery: Yes.

David: You're on an invited mission to try to figure out what the heck this tetrahedron thing is.

Emery: Right.

David: So what do you see? Let's . . . First, just tell me what the elevator looked like. Anything unusual about the elevator?

Emery: No, it was a very large elevator, larger than normal. You could put a car in it.

David: Oh, wow!

Emery: Normal elevator. Very clean.

David: Okay. Round, square?

Emery: No, square. Rectangular.

David: Okay. So the doors open, and what do you see?

Emery: We walk in. The floor was white. Walls were white. It was like a black rail.

David: A black rail where?

Emery: There was just like a black rail around the inside of the . . . like a rail you could hold on to.

David: Okay. On the walls?

Emery: Yeah, on the walls, about 3' up.

David: Okay.

Emery: There's no windows, no glass, nothing like that. It was just a normal elevator. It was very silent. I didn't know it actually started moving.

David: Oh!

Emery: It was like the most quietest elevator I've ever . . . You know, you usually feel the little bounce.

David: Right. Right.

Emery: There was no bounce. It was like we were sitting actually just talking, whenever we got . . .and when the doors shut, I was like, “Is someone going to push a button or something?”

David: Ha, ha.

Emery: I get antsy, you know?

David: Right.

Emery: And then I was like . . . And all of a sudden, like in a minute, the doors open. I was like, “What? Vatican elevator's broken?”

David: Are you wearing some kind of uniform or civvies [civilian clothes] at this point, or what?

Emery: I'm wearing civvies, yeah.

David: Okay.

Emery: Yeah, civvies. Nothing special.

David: So you go in after the doors open, . . .

Emery: Right.

David: . . . and what do you see?

Emery: The first thing I see is a giant auditorium-type area. It reminded me . . . and I don't like referring to movies, but in Harry Potter's “Hogwarts”, I think it was like the vault system with all the little trolls, where you look up and you see all these square vaults, but it was very rustic.

This was spotless clean. It was beautiful glass everywhere. It was just like . . .

David: Oh, my God!

Emery: . . . these huge cubicles of glass. And some were different sizes. So it was really neat.

And through these cubicles of glass were all these metal strips and lines.

And then there were these platforms about 6' in diameter that could travel to any of these things.

And there was no jerky movements to them. They just kind of flowed and then could turn, and . . .

David: Oh, wow!

Emery: . . . but only on angles. They didn't do circles, or anything, to whatever . . . And there were many people on these things doing things with the vaults and looking through them and doing things.

David: Wow!

Emery: But I didn't get to go . . . I was only on the first floor.

David: So this is kind of different. This is why I wanted you to say this, and why I wanted to do this right now is: the Vatican Library, you think it's like stacks of books and bookshelves.

Emery: Well . . .

David: This is very different.

Emery: Well, we're getting to that, . . .

David: Okay.

Emery: . . . because we had to walk through this area to get to that old . . . that other stuff you see in the movies of books everywhere and things like that.

David: But what you're describing right now is like straight out of a sci-fi movie. It must have been just breathtakingly incredible.

Emery: It was the most amazing thing . . . one of the most amazing things I've ever seen, . . .

David: Wow!

Emery: . . . because they're . . . the glass too, I was like, “This is . . .” They keep all this cool equipment behind this glass. I'm thinking, “That's ridiculous!”

Glass can break, and earthquakes, and, you know, whatever . . . explosions.

And he's like, “Oh, no. That's not glass. That's metal. That's a type of metal.”

The head director . . .

David: Wow! Like transparent aluminum, maybe, something like that?

Emery: Yeah, it was like a . . . Well, he said it's a . . . he did . . . He just said it was a metal. It's not glass.

David: Okay.

Emery: That's all he said. He didn't give specifics, and I wasn't there to learn about the glass, even though I wanted to know.

David: So what was behind the glass? Let's just be clear about that.

Emery: Many different things. I mean, there was equipment back there that I've never seen before.

Some things looked like weapons. Some things looked like scrolls but on big plaques of like kind of a . . . It looked like Plexiglas, like stacks of them.

And they all had their own thing. There's no labeling on the outside of these doors, so you know.

David: Wow!

Emery: None. No numbers; no symbols. It's just a gigantic, . . . like six floors of these cubicles.

David: Geez.

Emery: Unreal. I mean . . . And like I said, cubicles there too were as small as a foot (12”). And some were as big as 20'.

David: Was the thing like a hexagon or like a square?

Emery: It was all square.

David: Okay. Wow!

Emery: Yeah, it was all square.

David: Wow!

Emery: So as we were walking, I did notice some equipment that looked like giant . . . those Dorjes, those ancient brass things that they used to hold out.

David: Yeah. In Tibet.

Emery: Yeah, in Tibet.

I noticed they were in the shape of that, but they were solid, and they were luminous.

David: Wow!

Emery: And there were no electrical cords going to it at all.

David: I've always thought that the double Dorje thing is some kind of technology that they just emulated with these little sculptures they have.

Emery: Right, but this was like a really cool, artistic, modern, ultramodern version.

David: Wow!

Emery: It was really neat with really cool edges on it.

David: Wow!

Emery: And it was glowing. And there was no electrical cords in there or sockets. It was just there.

David: Wow!

Emery: So . . . And you have to understand I wasn't there for that. So I can't stop . . . This is not like walking through the Louvre, of course.

David: Yeah.

Emery: We're on a mission, and you just keep your mouth shut, and we go where we're going to go, which we wanted to go to the archives to find out about this, this device, or this ship, this craft with this light.

David: So what happened after you got through this majestic crystalline auditorium?

Emery: After we got through that, there was another double doors at the bottom, and they just slid open.

David: Like glass doors, or . . .

Emery: Hm-hmm, glass doors. They just slid open – just like separated.

David: Any noise?

Emery: No noise at all.

David: Wow!

Emery: It was very quiet in there. No echoing, either, which was weird for me, because I thought even like a voice would echo in this room.

David: And when you saw the people on those moving platforms, what were they wearing?

Emery: They were all in white, like those . . . you know the surgical suits that are made out of that fabric?

David: Ah.

Emery: And they had also on their heads the normal white caps.

David: Wow!

Emery: They're in a clean suit.

David: Clean room.

Emery: Right, but it wasn't surgically clean. I think whatever they were doing, they were all holding something and looking at something and looking into the glass.

David: Wow!

Emery: So I don't know what they were doing at all. I have no clue.

David: And do you think that there was anything beyond the first layer of these cages? Like was there deeper layers beyond one layer, or was it just all on the

surface?

Emery: On the first floor where I was, I could not see . . . I mean, it just ended. Some were 10' deep. Some were 30' deep. You know, like I said, some were small, like 12" cubes, and some were enormous.

We walked by one that was at least 20' tall (almost 7 meters).

David: Oh, wow!

Emery: Yeah.

David: Amazing.

Emery: Yeah, it is amazing.

David: So what happens after these quiet doors open up? Where do you go next?

Emery: So now we're in the main library, I believe.

David: Hm.

Emery: And there's these giant, cylindrical, gas-controlled tubes that are probably anywhere from 6' to 3' in diameter. And there's hundreds of them that go up very, very high.

David: You said 6' to 3' in diameter?

Emery: Yeah, 6' to 3' in diameter, glass, or whatever – metal, glass, or whatever they call it.

David: Okay.

Emery: And there's windows on them that open up, and it goes up and down. And they have a thing that they hold, and they can scroll up, and then all those books go down. Like they're all on shelves, all these books, okay, and all these tablets. And they go up and down.

David: Oh, wow!

Emery: Yeah, up and down inside these cylindrical columns, which I heard were vacuumed and gas-controlled to keep them from getting old.

David: Wow!

Emery: And so they took us to this place and went to this one column. And he just brought it right up – all these different books about this particular craft. And we were able to get all that information.

David: What did the books look like, and how old were they?

Emery: Well, it looks like these books were actually translated from another book that someone wrote, because they said a lot of this was all translated. So it was all perfectly written and typed, like very new . . . just like today, like nothing fancy at all, to be honest.

David: Okay.

Emery: It was in binders and folders and whatnot. So it wasn't fancy or futuristic.

David: Okay.

Emery: It was just a huge database. But in many columns I looked at were very old things, like very leather-looking books.

And I noticed one had blocks in it. And I thought they were blocks, but they were tablets with information on them.

David: Did any of the leather books have a color cover, like a bright color?

Emery: Yes, I did see one that had many . . . like one of the columns had many colors in it, . . .

David: Yeah.

Emery: . . . and many sizes too. Like I saw one shelf had 6' books.

David: Wow!

Emery: Yeah, it looked like books. I mean, it was far away, maybe 30' away.

David: Well, when Peterson described his trip into the Vatican, he said that a lot of the books were leather-bound and that they had buckles on them . . .

Emery: Yes.

David: . . . and that they were color . . . like bright colors, like a bright red, bright green.

Emery: Yes. Yes, yes, I saw that, and it was very thick.

David: Wow!

Emery: The leather was very thick, and they did have metal on them. I've seen a lot of that just walking to where we had to go.

David: So did you guys get to take the book and bring it to a reading area, like a table or something?

Emery: Yeah, no, he pulled it out. And there's tables everywhere that are off the ground on pedestals, and he just laid it out on this 6' glass pedestal, or whatever it was, glass or not glass. I'll just call it metal glass.

And he opened it up, and he is the one who shows us. We can't touch it, actually.

David: Oh.

Emery: So he shows like, dah, dah, dah, dah, dah, dah. And there was also a translator that was there, because the English was not that good.

And there were two other of their technicians there that upkeep, like library bookkeepers. So that was really interesting, librarians.

So the next thing that happened is they opened it up, and he just started scrolling through. And we were looking at it. I was looking at it with the two scientists.

And this is what we wanted. It was like exactly what . . .

So then we asked him if he had anything else that was similar to this. And he did.

David: Hm.

Emery: So then he took us to another area and showed us another book. And they actually had sketches of the same exact thing . . .

David: Wow!

Emery: . . . that was ancient.

David: Really?

Emery: I mean, I don't know how old it was, but it was pretty old because it wasn't written on paper – this giant sketch scroll that someone, some monk, had drawn.

And it had a lot of physics on it, and it was all in a different language.

So we were able to get a picture of that downloaded, and we got a copy of that book, and we escorted that back to home.

David: Did you get a sense from just what was spoken out loud or translated as to what this thing was or where it had come from, anything that specific?

Emery: No, because once I got back, I was pulled off of that project. All I can tell you is it was, I think, I believe, an intentional device that was put here to help. And then that was it. I've never had a part of that project again.

David: When it was in this foreign language, and you said it wasn't really like a book, what was it on? What did it look like?

Emery: It looked like wax paper.

David: Hm.

Emery: Yeah, and it looked like it was black wax paper. I think you could maybe . . . as you wrote on it, whatever that stuff was would peel off so you could write on it.

David: Hm.

Emery: It looked like something like that.

David: Wow!

Emery: But I wasn't able to touch it at all, but it was the exact same device – I mean the exact same craft, but it was a lot larger in form. It was probably 10 times larger from this person's . . . Whoever sketched this, it was 10 times larger than the one we had.

David: So how do you think that idea that we discussed about people starting to be trained as disclosure happens? How do you see that unfolding?

Emery: Well, the first thing that's going to happen is everyone's going to want to know where to go.

“I want to be this person. I want to help. I want to know how to grow something overnight – a tomato. You know, I want to know about anti-gravity – how I can make my car float.”

So people are going to want to know right away, and it's going to be up to the government what kind of information is going to be released to the universities and public, because they're going to do it correctly.

They are going to do it through probably universities first.

David: Right.

Emery: And hopefully, a lot of the other scientists that are out there will pick up on what they're doing. And then they'll be able to live stream it and have a source way to get it to the public, where other people can just start thinking about it, because you have to free-source everything in order to stimulate the entire planet into wanting to do something instead of holding it in universities and saying, “Well, you have to learn this first, and dah, dah, dah, dah.”

David: Right.

Emery: But I think the education part will also be a lot easier in learning this stuff, because with the advent of all these new technologies coming out, also comes out technologies how to learn faster, . . .

David: Yeah.

Emery: . . . how to take care of yourself better. You know, a lot of these things are daily things that we do are going to be much simpler.

David: Very cool.

Emery: Yeah.

David: All right. Well, thank you, Emery, for being here. And I want to thank you for watching. This is “Cosmic Disclosure”. I'm your host, David Wilcock, with our special guest, Emery Smith.

Bioship Season 10, Episode 5

Cosmic Disclosure; Bioship Season 10, Episode 5

21 Mar 2018

David Wilcock: All right. Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock, here with Emery. And in this episode, we're going to talk about organic craft.

Emery, welcome back to the show.

Emery Smith: Thanks, Dave. Thanks for having me.

David: So in order to open up this discussion, let's go back to your time at Sandia because we really have barely scratched the surface of that yet.

Obviously, we're going to get into this organic craft thing, but before we do, you had talked about the fact that, in the beginning, you were getting these partial bodies.

After you got through the salmon fillet phase, and then you got through the arms and legs type of phase, you got partial bodies.

Emery: Correct.

David: So the first partial body that you told us about was, again, what?

Emery: The crossbreed tiger-type human hybrid.

David: Okay.

Emery: Yeah. That was the one . . . It's very disfigured and dysmorphed.

And then the next one that followed that was the more of the smooth skin with the leopard skin, but with iridescent – like the peacock feather colors – skin.

David: Hm.

Emery: And that face was a little bit mutilated, so I couldn't see the actual . . . but it was a very normal-sized skull, just like a human. The body was very thin and lanky.

And these bodies is what brought me to see craft, because later on, some of the tissue samples I was taking, they asked me to come take samples from a completely different part of the base, or this underground facility, that I would have to travel to,

and also escort those samples back to my base, which was unusual for me to be a carrier, but it was all within the underground.

David: So if I'm getting this correctly then, what you're saying is, that in certain cases, you were working on a body, or a partial body, . . .

Emery: Right.

David: . . . but then they had reason to believe that there might be some biological similarity between the body and the actual craft that the body was in.

Emery: Exactly.

David: Wow!

Emery: Exactly. And so I would actually . . . They would come on the intercom and actually say, “All right. That's enough.”

Because I'm doing samples the whole time and giving them . . . As soon as I get a sample, I put it through the window. So they're already testing, in the back, the genetics of this thing.

So I just remember them coming on and saying, “Okay, That's enough, Smith. We need you to go do a run.” And I didn't even know what that meant, because I'd never done a run.

David: Do you think that the people that are on the other side of the glass, that you pass these samples into, are more specialized and skilled workers than you?

Emery: Oh, absolutely.

David: Okay.

Emery: I mean, I'm just a technician. These, probably, are the scientists and geneticists, you know, that taught me later on all about that kind of thing.

These people are probably those people grabbing it, running it through some advanced fast scanner of some sort. because they were always . . . [They would] immediately come back, within minutes of me giving a sample, as I'm taking another sample and say, “Stop that. Go up and grab something from the inner ear,” you know, or something like that.

David: Oh!

Emery: So they were immediately, probably, another team behind these windows that are trying to find something out specific from this species.

David: Did you ever get to meet any of them? Or did you recognize any voices as being common voices?

Emery: Yes, I did later on, but I was not really allowed to hang out with them or talk to them.

David: Right.

Emery: But I did hear . . . You know, I see people in the locker room. I see people in the cafeteria. I see people on the outside, but not until way later on down the road did I actually get to meet people that were actually those people.

David: Interesting. So do you think, in some cases, that the tissue was able to be reproduced, like to be grown?

Emery: Yes. Yes, for sure. That's definitely what they were doing. They were trying to reproduce these cells.

David: Okay. So then, you said that at certain points they might ask you to take tissue from the inner ear and stop what you were doing.

Do you think they have a database of the tissue samples, and they're comparing . . . when they make tests, they're comparing it to other parts of . . .

Emery: YES! Yes. Like it depends . . . They're not only taking the tissue to reproduce. They're studying the tissue. They're studying the eardrum. They're studying the phrenic nerve. They're studying the heart muscle of this being. They're studying all sorts of different parts of this body for some reason, for their own . . . Who knows.

So it's not just one thing. They're doing many different things with the body for their own reasons.

David: Yeah.

Emery: Maybe they just need that optical nerve because they want to know how they see. Maybe they need that tendon to see what those tenocytes are made out of, because it replicates so quickly in a Petri dish – one of the hardest cells to replicate.

So I think they're just studying this like we are. I think some of it sometimes may be used for evil, and I think some of it is just trying to learn and find out, what are these

beings, and where they come from, and what are they made up of, and so forth.

David: All right. I want to run something else by you since you brought this up. I think it's a fascinating thing to discuss.

Well before I ever met Corey Goode, or . . . I knew of him, but we hadn't gotten into this stuff till 2014, 2015.

I had been speaking to this insider, Jacob. And he told me, at some length, that the Draco Reptilian beings had essentially been all over our galaxy looking for various genetic materials.

And then they had taken the very best of the things that they found and had somehow spliced it in with themselves and had created a sort of super being out of themselves.

Do you think it's possible that we could be on a similar trajectory right now by all this genetic research that you're talking about?

Emery: Yes. I agree with that tremendously, just because of all the different requests and the different briefings I've been involved with in this MILAB.

And not to say it was . . . Like I always tell you, not to say that it was owned by Sandia or Los Alamos. Those are just names for cover-ups of corporations.

David: Yeah.

Emery: People need to know that as well.

David: Right.

Emery: It's just that's where I was. That's the area I was.

David: Right.

Emery: Now, getting back to your question. Yes, I believe they were trying to get this DNA and somehow mix it with human DNA, and create, or inject, some inoculation into a human being to see if they could mutate and have different factors and different abilities that beings have.

David: Well, like eagles . . . Apparently, an eagle could see a dime from the top of the Empire State Building on the sidewalk.

Emery: Exactly. Right.

David: So if we had THAT kind of vision, that would be exciting.

Emery: Yes, it would. But then I would have to clean my house extra, extra, extra hard.

David: Ha, ha, ha.

Emery: Because I don't like dust.

David: Okay, so at one point, you – or maybe more than once, but at least once – you were called in to a different location . . .

Emery: Yes. Right.

David: . . . because of this craft being organic, they thought.

Emery: Yes.

David: So let's talk about that now.

Emery: Well, that's when I said they were like, "Stop what you're doing."

No one's ever said, "Stop what you're doing and go change out" or whatever. And "change out" just means get out of the spacesuit.

So that's what I did.

And they were right there, and they were like, "We want you to go here and take the tube, and you're going to be dropped off here, and so-and-so will be there to escort you to this area.

And that was the longest ride I've ever been on a maglev tube.

David: Like a sub shuttle?

Emery: Yeah, it was a sub shuttle capsule. It was a capsule, yeah.

Because you can't ask anything. You understand, you cannot, you know . . . They did tell me that this being came from this craft. They did tell me that.

David: Hm.

Emery: And that I was supposed to take these samples from this part of the craft – I

had my folder with me – and was escorted to this – you know, this was one of the first times I rode this thing – and got there.

These two guys came out. One was a security guard, and one was a scientist. And there was no other security. Like no . . . You didn't even have to pass through anything.

So it must have been part already . . . Once you get under, then you can go pretty much anywhere.

David: Can you describe what the room looked like once you got out of the capsule?

Emery: Yeah, sure. It looked just like a very clean, New York subway station.

David: Oh, wow!

Emery: Yeah.

David: Okay.

Emery: But it was very . . . another all white area, very clean, very silent. You could hear a pin drop.

David: Did you have some sort of container with you for samples?

Emery: No, nothing. I had the folder.

David: But what do you do with the sample?

Emery: Well, they have everything there.

David: Oh!

Emery: Just like this operating room I was in . . . THIS room . . . this thing is in a huge operating room . . .

David: Right.

Emery: . . . you know, this craft.

David: Oh, wow!

Emery: Yes.

David: So you walked into some sort of room where the craft was?

Emery: Well, first I had to go change. They made me change again into another . . . very similar like a locker room, but I didn't see any colors on the floors like in the hallways I told you about, the color codes.

David: Ah, right.

Emery: And there was always someone with me. They wouldn't let me be alone.

So I walked for at least 10 minutes down a very long, white hallway. There were many doors on the sides of the hallway, like every 100 feet.

And the door opened, and there I was in this giant – what I would call – a sterile hanger.

David: Wow!

Emery: A sterile hanger is what I'll call it.

And there was this craft there, and there were many people there, a lot of people running around. They were all, of course, in clean scrubs, white . . . had the white jackets.

David: Now, you would assume a couple of things, okay? You would assume this is an underground base.

Emery: Absolutely. Yeah.

David: That it's on Earth most likely. Or we don't really know that, right, because the tube could have taken you to another planet, potentially.

But they didn't tell you one way or the other, I assume.

Emery: *[Emery shakes his head "no".]*

David: And that those other doors would have other craft of some kind in them as well.

Emery: Oh, for sure.

David: And they made sure that you only went to the one door, so you couldn't possibly have gone and tried to open another door.

Emery: There's no way. They had biometric . . . They had so many ways . . . Just to get in that door, he did the same thing we would do at the top of the facial recognition and the hand print.

David: Wow!

Emery: Yeah. They're getting a little bit more different now. Now, they're doing the DNA thing. But anyway, we'll get into that in another . . .

David: So what do you see? What does this thing look like when you walk into the room?

Emery: It's hard to explain, but if you ever ate ice cream, . . .

David: Okay. Ha, ha.

Emery: Like if you had an ice cream scooper, and you make those round scoops. And if you ever made jello in one of those containers where it goes like this, and then like this, and then like this. *[Emery uses his hand to show a three tiered jello dish.]*

David: Oh.

Emery: Okay?

David: Yeah.

Emery: Do you understand? I don't know what shape to call that.

David: It was a jello tree.

Emery: It was like a jello tree. Ha, ha. It was.

And . . . It was like this. *[Again, Emery, repeats the same hand motions.]*

And it was the most beautiful . . . I don't like the color red, but it was the most beautiful color red I've ever seen.

David: Hm. Glossy?

Emery: Yes. Yeah. Very reflective.

David: Any seams or just smooth?

Emery: No seams at all, completely smooth. And it did not give off any light, but it was kind of transparent and looked kind of like jello.

David: You could sort of see through it?

Emery: Yeah. It was kind of transparent, a little bit.

David: No discernible features on its surface? No writing?

Emery: Nothing?

David: No windows?

Emery: Nope.

David: Huh!

Emery: That was it.

David: Did they know how the beings got in or out of it, of the craft?

Emery: Yes.

David: Okay.

Emery: Because I had to go inside.

David: Oh, wow!

Emery: Yeah. And that was wild.

So I have this schematic. I have actually two other technicians that are here – they work here – and they're with me, with all the sampling containers, and all the . . . You have to do this in a very sterile fashion, you know, with special instruments, and it's all right there.

And these two guys . . .

David: Was the schematic on something like your folder?

Emery: Yeah, it was on the folder.

David: Okay.

Emery: This exact craft was on the folder – head-to-toe, inside, outside, everything.

David: Okay.

Emery: Anyway, so these two guys are with me. We're walking up to the craft, and I'm allowed to share . . . They know, of course, everything I'm doing. They're assisting me, which is cool.

So I go to this point on the craft and, basically, cut a piece of the craft away with a special device.

David: Hm.

Emery: And it was just like the tissue from the being.

David: Really?

Emery: Yeah. Same consistency.

Which, I didn't tell you about that specific being, by the way.

David: Okay.

Emery: But it was very [much] the same consistency of that.

They took me around to the other side, and I took another piece and went underneath and went in the middle of this thing, because it's suspended.

And it is suspended. It has some sort of . . . There are . . . I don't know if it was metal, or what it was, but it was on something that was keeping it up in the air.

David: Like a chassis of some kind?

Emery: Yeah. They had built something to keep this off the ground about 9', 9'~10', I would say.

David: Did it move or wiggle at all? You say it was like jello. I'm just wondering how far we can take that analogy.

Emery: No, it was solid . . .

David: Okay.

Emery: . . . but the consistency and the transparency of the first inch of this craft was transparent, like Plexiglas. You could kind of see into it.

David: Wow!

Emery: And then it just stopped, because it got darker. It got darker, I think, with the color, as you looked in.

David: So you go underneath it, and what do you see? How do you get inside?

Emery: So underneath are all these other round cup . . . like if you had cut a baseball sized sphere in half, and now you have that round cup, and you would pop it on the bottom of this craft. *[Emery motions that the round portion is facing downward.]* There was like thousands of these little bumps, these half spheres on it.

So I was also instructed to take this sphere near the center of the craft, which was kind of hollow.

And I did. And it just came right off. It was not like something you had to take a chainsaw to. It was very simple. It was like cutting into human tissue or tissue from an animal.

David: Was this some sort of beam cutter, or was it more of a scalpel?

Emery: I'd rather not say anything about the exact device.

David: Okay. Okay.

Emery: But all I can say is it was made for cutting pretty much any type of tissue without destroying the tissue.

David: Ah!

Emery: And that'll probably come out to the public soon.

David: Okay.

Emery: So we took that and went down the center. And in the center, they had this little device like you see in the warehouses that go up and down.

And we got on this thing, and it lifted us up, and it goes all the way up into the thing. But it's just a wall with all those bubbles on it again.

David: Oh, wow!

Emery: Yeah. So I don't know if that's the inside, because it was hollow on the inside.

So I went all the way to the top, and there was this one big, big bubble on the inside of this thing. Big sphere. 3' in diameter.

They would never allow me to go in there if it wasn't safe. Of course, it wasn't radioactive, but it had this glowing . . . kind of like on your Apple computer, that scary Apple computer light I don't like to see at night. It's like "a-a-a-ra, a-a-a-ra".

David: Yeah.

Emery: It was like that. So it was doing this thing, and I felt kind of bad. I was like, I think maybe this thing might be still alive or something.

So I took a small sample of that, a very small sample. That's what they asked for – a small sample of like a punch biopsy, we would call it. It's probably like the size of an eraser tip. That's how much I took.

And I handed it off to the guys. They wrapped it all up, put it in a special box for me, and next thing I know, I'm back being escorted right out.

The whole thing took less than two hours.

David: Is the box clear?

Emery: No. No, it was a silver box, and it has inside a special canister that regulates temperature inside the box.

And the box is specifically made for these samples, like already pre-cut. [It is] kind of like you get those pelican cases, and they pre-cut the insides of them out. It was just like that, but it was vacuum-packed and vacuum-sealed, and it was very lightweight.

David: So let's talk about this . . . This craft is so bizarre. It's so unlike what any of us would have expected you to say.

Emery: Yeah.

David: Let's talk about the being now.

Emery: I know it sounds crazy.

David: No, it's cool. Let's talk about the being. What was the being like?

Emery: The being was very similar. It had a red consistency. And it was very . . . Remember I told you about that jelly-like creature, like we talked about, the transparent one before, which we'll get into later?

David: Uh-huh.

Emery: But this one was solid, and it was just perfect human shape. It had a face, though, that comes to a point instead.

David: Really?

Emery: Yeah. So the face comes this way. *[Emery brings his hands from the sides of his face toward this nose and mouth showing more of a pointed edge than rounded face.]*

It reminded me of . . . If you get an acorn – the shape of an acorn.

David: Okay.

Emery: And you know how it does have this cup-like . . . you know, it's not perfectly round. It has this teardrop-type . . .

David: Sure. Sure.

Emery: And if you get the teardrop, and then you just squish it a little bit, it was just like that.

David: Really?

Emery: Yeah. But by squishing it, not that it would bulb out, but it would come to a point.

David: What was the size of the facial features compared to the size of the head? Like if you could map it out with . . .

Emery: It was very similar to a human's.

David: Oh!

Emery: Like, as far as how far the eyes were . . . because that's one thing we measure. We measure across the eyes. We do a symmetrical test like plastic surgeons do.

So we want to see symmetry. We always measure all of that, and we also have a scanner that goes over the whole body to 3D replicate it, and models.

So every creature they have is already 3D model replicated.

David: Wow!

Emery: And so there's a whole museum of this, by the way, of these craft and all the beings, . . .

David: Really?

Emery: . . . all 3D replicated in many different materials. It is like this secret museum with all this stuff in it that's locked away somewhere.

I don't know where it's at. I have no idea. But I have seen many of the models in the projects for specific beings.

David: So when you say the eyes were white, are they round? Are they almond shaped? Are they like human eyes? What would the eyes look like?

Emery: No, they were more round than the typical almond shape, but they were the same size.

And this creature was probably 5' 5", about 5' 5", 5-foot, 5-inches tall.

David: Was it just all white, or did it have something like an iris or pupil?

Emery: No, there was a different color – white in the middle, but it was still all white.

But there was a circle in the middle that was whiter than the rest of the eye. So you could see that.

And I was not . . . My part of that being was not to have anything to do with the face or the eye for sampling. I was actually down low doing something with the reproductive system, taking some reproductive organs out, when they told me to stop and go to do the run.

David: Did these beings have a skeleton?

Emery: Yes.

David: And how similar to us would the skeletal structure be, from what you could tell?

Emery: Just from where I was working at in the pelvis, it was very similar. I didn't see anything different.

I did not see the X-ray of that, or the CAT scan, or MRI, or what we call the . . . Well. we have a special scanner that scans the whole body. And you can really see everything all at once before you go in, but I didn't get to see it on this being. I only got to see the scan for the reproductive area.

David: How many . . . Did it have hands like we do?

Emery: Yes.

David: And how many fingers?

Emery: But they were smaller. They were smaller and thinner.

David: Okay.

Emery: Yep.

David: How many fingers?

Emery: And longer. There are five fingers.

David: But longer fingers, you said?

Emery: Yeah, they were longer – a lot longer than our fingers by . . . You know, I have a size 9 hand, which is pretty big. I would say these creatures would probably have fingers maybe 30% longer than our fingers.

Yeah, they were very long and very thin. And they did have fingerprints.

David: Hm!

Emery: Yeah, they had prints on them.

And their skin was just like this *[Emery points to his skin],* but it was red.

David: Oh, so it was actually more like a human in the way that . . . the texture of the skin.

Emery: Yes.

David: And what kind of red would you say it was, like if you had to describe the red a little more in detail?

Emery: Like a brick red, rose red, if you mix that together. It was a nice red. It was like a matte brick red.

David: Okay.

Emery: But not as dark as brick red – a little bit lighter.

David: Did it have any body hair?

Emery: No.

David: Okay.

Emery: None.

David: What would be the proportions of the skull to the body compared to one of us?

Emery: The skull was a little larger than a normal human skull, and the torso was smaller than our torso. But the legs were longer, and the arms were a lot longer than our arms, to say the least, . . .

David: Wow!

Emery: Yeah. . . . as far as symmetry.

David: So do you think that if somebody who didn't know anything were to have one of these walk up to them, with these white eyes and red skin, do you think they would be terrified?

Emery: Well, . . .

David: Or did it have sort of a noble look to it?

Emery: . . . I don't believe so. Or course, the fear that's installed and programmed into us, yes, maybe. But you have to understand, they don't . . . when you approach, usually, extraterrestrials, you're going to know right away.

Like that guy hiding in the corner as you're walking around the alley, he just doesn't

feel right. You know, you get that feeling.

You know, never use this *[Emery points to his head].* Always use your heart to feel.

And I think that, for the most part, on first seeing something, you could possibly maybe have a fear factor involved if you have not been in these projects, of course, or have never seen this, and you're 15 years old, and you're in the woods, and here this thing is.

Yeah, they're probably going to scream bloody murder.

David: Ha, ha, ha. Right.

Emery: But then again, if this was walking down the streets of New York, I think most of the people would be more enticed about it and not go throw rocks and hatchets at it.

David: Sure.

Emery: I think they would be coming up and . . . Here you have this being with its arms open, with no weapons, not hurting anyone, not saying anything, let's say, and emanating a very good peaceful energy, or negative energy, whatever the being is.

People are going to respond in the right way.

David: Yeah.

Emery: I believe in the people. I believe people will do the right thing.

David: What was the most physiologically abnormal or different thing about this being that you saw either on the MRI or in the autopsy?

Emery: It was the uterus. Yes.

David: What was different about it?

Emery: It had four chambers.

David: REALLY?

Emery: Yes.

David: And did they have any speculation as to what that might be for? Did it have

multiple . . .

Emery: It can have multiple children all at the same time . . .

David: Wow!

Emery: . . .4 children, or 6, or 8, or 12.

David: Very interesting.

Emery: Yeah.

David: Is that something that might be common, or is that kind of unusual?

Emery: That's very unusual. It means that species can multiply very quickly. And they have a way of measuring the chemicals in the body to measure how fast they can gestate, which is really cool.

David: Here's what I don't understand: the uterus has all these chambers, but it wold appear, based on conventional human gestation, that the baby has to grow to a large enough size to really kind of fill the womb.

How could a being have so many chambers and still have the offspring able to actually be born and be healthy?

Emery: We believe that this being only has babies once in their lifetime. And it's possible, after that, they die shortly after.

David: Really?

Emery: Yes. But that's inconclusive. That was just where it was left with me.

David: Do we know anything about what these beings are called or where they're from?

Emery: Yes. Ha, ha.

David: But you can't say, or can you?

Emery: No. No.

David: So it's really bizarre to me to try to understand: how do you get an organic craft that looks like the body?

I mean, if people didn't have the respect for you that they had in previous episodes, this whole thing might sound completely, totally ridiculous.

But yet, on the other hand, the way you answer my questions, I always use forensic techniques. I jump around, and I ask really specific details, . . .

Emery: You're good at that.

David: . . . and you don't miss a beat.

Emery: No.

David: So this is a very strange thing we're talking about.

Emery: Yes. So the craft are made in space. They're made by harmonics and frequency and sound. And they are also, just like I can say, for example, your own pet. And what that means is: you have a good conscious connection with this craft.

Lots of craft can be made from your own DNA, have a piece of your DNA in it, and that allows you to consciously assist with the consciousness, you know, speak to the craft telepathically, and also move the craft without doing anything.

David: Hm.

Emery: The cells on those craft are living cells. And without getting too far into the physics and science, that doesn't exist yet, which will sound a little crazy, those cells have micro/nanoparticles of computer technology in them.

David: Wow!

Emery: Yeah. They can store energy. And we're talking on a super nano level, you know, very, very small.

The cells themselves, like, one day you asked me: “How the heck do these cells, or these synthetic cells, work like the mitochondria?”

And I was kind of hesitant to really tell you, but they're like micro capacitors inside these cells that self-regulate, so the whole body, and every cell in that craft, is actually speaking to itself.

David: And I think you had said at one point that, in some cases, it's like a hexagonal matrix?

Emery: Yes.

David: Like a honeycomb?

Emery: The scaffold is sometimes like a hexagon, like a honeycomb. And that allows cells to go in there, and grow into there, and be happy.

But that scaffold, also, is the whole part of the craft that allows the craft to communicate with the cells and the user.

David: So you're saying that they can grow a craft in space?

Emery: Yes.

David: And how prevalent do you think this is amongst extraterrestrial civilizations that are advanced enough to travel here?

Emery: I think it's a common thing. They learn how to produce gravity, a gravitational field – an electromagnetic field that envelops the craft and the person, so they have their own atmosphere, and their own gravity.

And that's why they can go a million miles an hour and turn at a 90° turn, because they're in their own gravitational force that has nothing to do with a planet or anything else around them.

David: I guess one of the things that . . . If we're going to really get speculative here . . . People might wonder, if the craft would become sentient and then perhaps turn on its owner at some point if it wasn't feeling respected?

If there could be some danger in having a being with free will that is your spaceship?

Emery: THIS is where it gets really interesting. The craft IS you. So YOU are the craft.

Now, if you are suicidal, then the craft will be suicidal.

David: Hm.

Emery: If you are having a good time, then the craft is going to be happy too.

And it feels this way on a craft. You can actually feel this back and forth.

You know, it's not operating really on its own as much as you think. It is its own

sentient, but it only feels your emotion, which is really neat.

David: Wow!

Emery: I've been on craft before where I felt like . . . the best way I could put it is: I felt like it was my pet dog, because it was just so funny and cuddly and hilarious.

David: Wow!

Emery: But at the same time, it was very obedient like a dog.

David: Interesting.

Emery: It would never turn on its owner. You know, although some dogs do, you know what I'm getting at.

David: Right.

Emery: I'm getting at that point where it's a very beautiful connection between the beings and their craft.

David: Well, it makes sense you would want to design it that way, so it was safe.

Emery: Right. I'm going to program it not to bite me anymore. Ha, ha.

David: Right. Ha, ha.

All right. Well, Emery, I want to thank you for being here. And I want to thank you for watching. This is Cosmic Disclosure. I'm your host, David Wilcock, here with our special guest, Emery Smith, talking about organic spacecraft. Thanks for watching.

The Arrival of the New Guardians Season 10 Episod 6

Cosmic Disclosure; The Arrival of the New Guardians Season 10, Episode 6

David Wilcock: Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock, and we are here with Corey Goode. And in this episode, we're going to get into the return of the Guardians.

Corey, welcome back.

Corey Goode: Thank you.

David: So where we last left off, you had just met with Gonzales, who was talking about his work with trauma-recovery victims and these red-haired giant peoples. Then you had a meeting with the seven different groups of the Anshar in a cleansing room.

So could you pick it up from there and tell us what happens at this point and where you go next?

Corey: While we were still in this cleansing room, and there was still a line going, I was told that this was a celebration and preparation ceremony for meeting the new Guardians, and that it was my honor . . . I was being honored and being allowed to participate.

I told Aree and her sister it was MY honor, and that I was thankful, and they were just very excited and playful. I mean, they were in a party mood. It was a party mood.

David: Hm.

Corey: And it was right after that, I started seeing these goblets, little glass-looking goblets, being passed around, and they looked almost like champagne flutes, but they weren't tall.

So they were handing them around, and I was told that this was the nectar of Isis that I had been offered before that I had turned down.

And everyone was holding a glass. I was kind of holding a glass, and I was kind of like holding it like this, like you do a flute of champagne at a party. [Corey shows he's holding his glass low and close to his body.]

And I looked up, and Aree was watching me and amused because I didn't know what was going on. And she held her drink up like this [Corey holds the glass higher and out in front of himself], and she passed her hand over it [Corey passes an open hand

over the glass] with her lips moving like she was saying a prayer.
And then she held it up and took [Corey breathes in the aroma from the nectar] a big ole deep whiff of the nectar, and then she drank it.

David: So in the past, you were very reticent to drink this elixir, apparently feeling that it might be some sort of psychotropic drug or something like that.
Corey: The first time I met her was when I was offered the drink, and I wasn't going to take a drink like that from a stranger. I didn't know who she was.
David: Hmm.
Corey: At this point, I trusted her. So I did what she did. I did the best I could to repeat it. Said a little thing to the One Infinite Creator blessing improv, and I took a drink.
And immediately, I felt this energy spreading out down my mouth, down my throat, all throughout my body. It's almost like a heat, a warmth. And I became extremely euphoric.
David: Was it like a physical numbness that you felt as you drank it?
Corey: No. It was a warmth and just an energy that kind of spread out through my body.
David: Wow!
Corey: Very unique. And I looked around, and the energy of everyone, as they were drinking it, was changing. They were becoming more . . . kind of like outgoing. They were not keeping up their appearances like they were before.
You know, different groups felt like they had to hold theirselves a certain way in front of another group.
Everyone became relaxed, and I felt connected with the Anshar in a level that I had

never felt connected before, even using their chairs.

David: It sounds to me kind of like this is not just a chemical effect, but that there was some sort of energetic component to the beverage. Do you think that's true"

Corey: That's exactly what it was.

David: Okay. Could you tell us how long this euphoric ceremony lasts after you drank the beverage?

Corey: After I drank the beverage, it seemed like only moments that I had to enjoy the effects.

David: Hm.

Corey: Because then, I was grabbed by Aree and her sister and several others that were headed towards the door.

And we headed towards the door. We walked back out into the large domed room where I had appeared the first time and every time since.

There were the two guys at each door, guarding the doors, as the last time.

And we went back out into the cavern area where the city used to be.

And now, there was a huge 120' across classic-looking flying saucer that was parked a little bit off in the distance with a ramp down. And we could see a little bit of movement and activity.

As we got closer, I could see some of that Omega group of the Inner Earth, the ones that had dark hair, looked very Caucasian, military looking.

And they were wearing these blue one-piece uniforms with these big gold stars on them, like the star I saw on the table in the Anshar meeting. It was like a symbol of Venus, basically, on their left chest area.

David: Okay.

Corey: And they were guiding all of us into the craft.

We all sat down, got comfortable, and everyone loaded up, and then we took off.

David: Now, at this point, were you aware of your destination? Did you know where you were going?

Corey: Aree and her sister sat on either side of me, and they confirmed that we were

headed to this space station that I went to prior, where I met the Sentinels.

And they were calling it the Council at Saturn.

David: I thought the time you met the Sentinels was at Venus, not Saturn.

Corey: I met them on Venus, but if you remember, afterwards, I was taken to Saturn to one of these same anomalies, like is off of Jupiter.

David: Ah.

Corey: And when I entered in, there was an identical space station.

David: Interesting. Okay.

So what's the next thing that happens? I guess you must have disembarked from the craft. Did you feel it land?

Corey: When we docked, you really couldn't tell.

David: Hm.

Corey: There was no “phzzzzz” [Corey releases air], anything like that.

David: Okay.

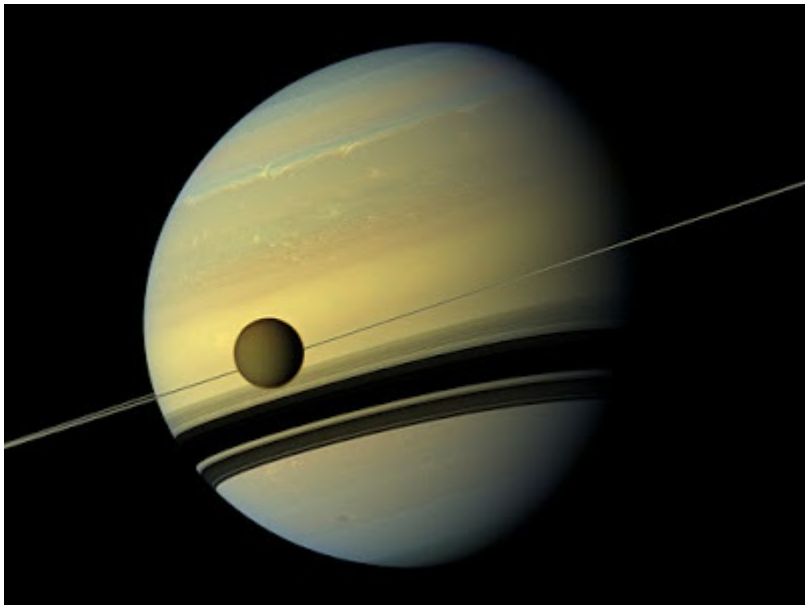
Corey: It was just . . . People started getting up and leaving. That's how I . . . I mean, we just got up and started leaving.

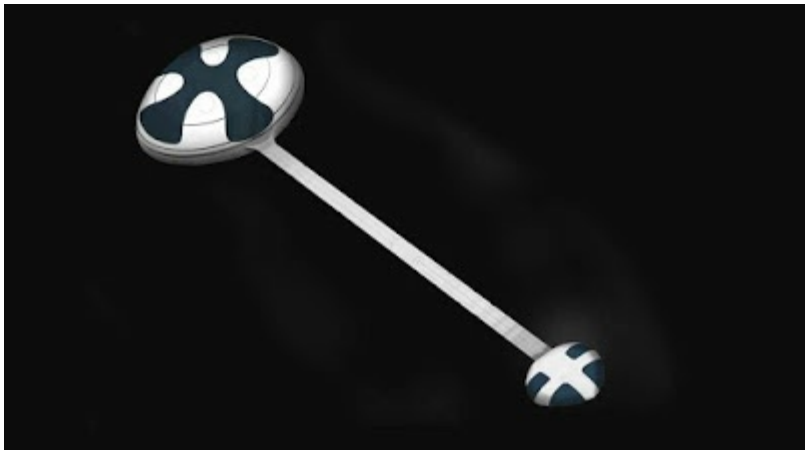
David: Okay.

Corey: And we walked through the docking station. The doors are huge, because they are meant to service beings that are 18' tall or so.

David: Wow!

Corey: And so are the hallways, passageways, through the space station.





The long skinny section that leads to the rounded section, when you walk through

that, the ceilings are very tall.

They brought us to the main area, and that's where the meeting would occur.

David: The previous meeting that we had in other episodes featured you with the Super Federation, and they were told that they were no longer going to control humanity's destiny. And apparently, they got very upset.

Corey: Some of them.

David: Did you feel any sense of anxiety going back into a room that looked the same now, as if, maybe, you were going to have another experience like that?

Corey: No, because A, I was feeling euphoric from the elixir.

David: Okay.

Corey: And it was wearing off. It wore off fairly soon. And we had all the Anshar around that were extremely excited.

There were like 40 representatives inside this flying saucer.

David: Hm.

Corey: And we all filed out. We went into the large meeting room, and we all got in to like a semicircle to wait for the next part of the meeting.

David: Did it look exactly the same as the Super Federation meeting room?

Corey: Exactly, except there were no chairs. It was completely empty.

David: So what happens at this point once they form this semicircle?

Corey: I began to walk across the room to go over and meet Mica.

And when I was about to the halfway point, Teir-Eir and the Golden Triangle-head beings appear in the room.

And not only did Teir-Eir appear, but the two other Blue Avians appeared but were

not standing next to Teir-Eir.

David: And just to clarify, you had said that Mica represented a group that we on Earth would know as the Olmecs from South America.

Corey: Right.

David: Could you just briefly remind us who that Olmec group is, and what's their relationship to us?

Corey: Yes, many, many, many times on Earth in our history, refugees have been brought from other planetary systems to stay here and live here. And they've lived here for many generations at times. That was the Mayans.

But the Olmecs, when there was a major issue going on in their star system, many of them were brought here as refugees to survive here and wait out the issues there. Then they were brought back.

David: Issues like a war? Do you know what it was?

Corey: I don't know what it was. It could have been a war or something crazy going on in their star system.

David: A cataclysm?

Corey: It could have been a cataclysm.

David: Okay.

Corey: It could have been what happened with the Native Americans that have stories about being taken underground during cataclysms.

They may have been taken through a portal system to another planet and been refugees.

David: So did the Olmecs ever tell you why they made these gigantic spherical stone heads of themselves and bury them in the ground? Did you ever get that?

Corey: No.

David: Okay. But do you know how many of them were dropped off here?

Corey: It was thousands. Their number grew from thousands to tens of thousands while they were here. And then they were all removed and brought back to their star system, which is one of the closest stars, if not the closest star, in our local 52 star cluster.

And it is a mostly ocean planet that's made up of a bunch of islands and one main kind of a continent.

* * * * *

Note:

It is very interesting to hear the proposal that many ancient Earth civilizations actually came from different planets in different star systems. According to Goode, some of

these civilizations actually came to the Earth as refugees and were possibly relocated here due to significant changes occurring on their home planet.

I find these possibilities especially interesting specifically because they directly relate with the testimony we have heard from Corey in the past. The likelihood that the Earth will be going through drastic changes on the surface and that these changes may even require our own temporary vacation from the planet's surface may give credence to the possibility of planetary ascension.

It has been stated numerous times how both ancient prophecies and modern science suggest that when a planet undergoes ascension (i.e., massive energetic shifts), numerous natural disasters can occur. Volcanoes may erupt, oceans can be displaced, entire continents may rise out of oceans while others sink into the sea, all while the planet experiences an extended period of earthquakes.

David: Now, you've said before on this show that what makes them unique for us is that they had overthrown Draco Reptilian rule on their planet.
From our perspective, how recently has that happened for them?
Corey: Well, three generations ago, and I'm told that their lifespan is around 300 years.
David: So that would be like 900 years?
Corey: Yes.
David: You were walking towards Mica, and then you have Teir-Eir and the Golden Triangle head being manifest. And what happens at this point?
Corey: I stop and I look at Teir-Eir, and Teir-Eir motions over to the people that

Mica's with, and he asks me to count them.

So I go and I count them, and there are 52 of them.

David: Are these all Olmecs or were they different types?

Corey: No, they were all humans of different types, and most of them were not Caucasian. They were different types of olive skin, brown skin, and even a kind of a tan skin.

But they were representatives of each of the local 52 stars. And they are all basically our cosmic cousins. They are human beings, just different types.

David: Okay.

Corey: And what I was told is that in the previous meeting, THESE people, these representatives, are now going to be on the Super Federation board, . . .

David: Oh!

Corey: . . . and they're going to hold positions along with us.

David: And so just to clarify, what does the Super Federation have to do with us if we are now a part of it, because I thought before, it was something completely . . . that we had no access to.

Corey: The 22 genetic experiments were no longer going to be headed by the Super Federation.

We're being given the management keys of our own genetic and spiritual development.

David: Does that mean that we will come into capabilities to expand our genetics as we choose? Like, could we start to modify our DNA in ways that we like?

Corey: Yes. And, apparently, we do.

On the Anshar timeline, they discussed their history with me a little bit about what humans go through, the process they go through after they learn about the 22 genetic experiments. They rebel against them.

Then they over embrace them and begin to hack our own DNA.

Things get out of control that way into a point to where we all start developing ourselves out to more of a pure form.

I know that sounds racist to a lot of people, but, apparently, we go through an incredibly rough period of development.

After I counted the number of people, it was indicated that I should go stand with them.

So I was standing with the 52 beings that I had just counted.

David: Hm.

Corey: And when I was standing there, Mica was introducing me to the people around him real quickly, but we didn't have much time.

David: Well, now you said 52 stars in our local cluster. Is there a relationship between that and these 52 beings?

Corey: Right. Each being is a representative from one of those stars.

David: Oh! Okay.

Corey: But he was quickly introducing me to a few people around, and he mentioned that each being that is present was pretty much picked by the Guardians.

Each of them have either been in contact with the Blue Avians or the Triangle-Head being and gone through a similar thing that I have in their planetary system.

David: So this must have been really exciting, given that if, as you've said before, the Olmecs were contacted by the Blue Avians and the Triangle beings, if each of these groups represent people who have been contacted by them, I would imagine they

would be very excited to see these beings show up again – the Blue Avians and the Triangle beings.

Corey: Yes. This was a BIG moment for everyone present – a lot of excitement. As I was talking with Mica, I looked over, and I noticed kind of a procession that started. And the different Anshar groups were going up to Teir-Eir and the Golden Triangle being and were bowing, and some sort of communication was going on. And then they would leave. They were filing through in a line.

David: Hm. After they got done meeting with these existing Guardians, what happens next?

Corey: The Sentinels then appear. And I've gotten a weird feeling from them.

They feel like they're a projection from another density or domain, that they're projecting here from another domain.

David: Well, and you said that when you went to Venus, if we line up your story with what's in The Law of One, it would appear that Venus was a source for the Ancient Builder Race, which could be over two billion years old.

That these Sentinels may have been somehow related to a civilization over two billion years old. So could you explain that?

Corey: Yes. They were somehow caretakers of the remaining technology here.

David: Hm.

Corey: So, like I said, it was like they were projected from another realm.

They immediately started interacting with the Guardians, and when they did, the room started . . . around them immediately in the room, these weird streaks or tongues of light started kind of darting around and disappearing, almost like flashes.

It started off slow. Then it picked up, and it got faster and faster, and then it stopped.

David: Were there colors to the lights? What did it actually look like?

Corey: Yeah, there were all the colors of the rainbow.

David: Hm.

Corey: Definitely. All the colors of the rainbow.

David: What was your emotional impression as this was taking place?

Corey: I was in awe. Everyone in the room was in awe.

Although we didn't know what was going on, it was a part of the way they communicated with the Guardians.

David: What is the next thing that you noticed?

Corey: Once this meeting was complete, everyone just kind of started shuffling around into this big circle with the Guardians in the middle.

We all kind of got into this circle, and Teir-eir motioned that he was going to speak through me again.

David: Hm.

Corey: And as usual, he had me great them “in the Love and the Light of the One Infinite Creator.”

And they began to have me address everyone present and to state that the new Guardians were coming, and that the Solar System had gone through enough of the transition to where the Blue Spheres were not needed anymore. And they were beginning to just disappear.

And the same was occurring with the barrier around our Solar System. It had phased out. It was basically gone.

David: Really?

Corey: And the Guardians stated that if it wasn't for the Galactic Federation, which seemed to be something different completely, and their blockade around our Solar System, they said that after the barrier fell, the Reptilians and other groups would have escaped through ships if there had not been a blockade formed there.

David: Now, if the Blue Spheres, that you were talking about before, were essentially giant technologies or beings . . .

Corey: Beings.

David: . . . that came into our Solar System, ostensibly, to stop a Solar Flash from happening at the end of the Mayan calendar of December 21, 2012, is when I was expecting it would happen from the science that I've studied, the ancient science.

If those spheres have disappeared, then why wouldn't we get a Solar Flash?

Corey: They weren't preventing a Solar Flash. What they were doing is: leading up to the Solar Flash, more and more energies will start coming through our Sun and the cosmic energy that we're passing through.

What these spheres did was they acted like some sort of a resonant system that when the energies came in, it buffered the energies.

So now that they're gone, we're getting the full strength of these waves of energy.

From what I'm told, our star is expected to go through these energetic Solar Flashes when it comes out of solar minimum in 10 or 11 years, is when they're expecting the major stuff to happen.

David: So that would be somewhere in the neighborhood of 2027 or 2028?

Corey: Around that time.

David: Okay. Then we do need to make some kind of public statement, because some of the things that you said to me before had put emphasis on the year 2023.

And I had been led to believe that that was when you had been told the Solar Flash would happen, somewhere around 2023 or 24. So could you clarify the difference between this window of 27 to 28 and the window of 23 to 24?

Corey: I think there is some confusion because the '23, '24 has to do with a timeframe

that all of the Disclosure information would most likely occur.

David: This is more of a Full Disclosure?

Corey: It's more of a Full Disclosure and more of an Event. It's focused around there being a Solar Flash. It is not a Solar Flash.

There are flashes and events that lead up to the crescendo event. So uh . . .

David: Are you saying those flashes might even take place over the course of years?

Corey: Yes.

David: Really?

Corey: They've already started.

David: Well, but we haven't had what the 35 different ancient prophecies seem to describe as akin to like a photo flash bulb going off that makes the whole Solar System extremely bright.

Corey: It is said that we're going to have a number of those that are going to lead up to the big crescendo event.

David: Wow! Do you think that, perhaps, the first of those big bright flashes could happen in the '23, '24 range?

Corey: I was told that they've already started . . .

David: Hm.

Corey: . . . on a lower level. They build up.

David: Oh, okay. So I just want to clarify then, if we're not getting any serious disclosure until '23, '24, that still leaves us with as much as six years. What would happen during those six years?

Corey: Well, that's up to us. The plan is to give us a slow, unrolling of information, but no plan survives the battlefield. Who knows what will happen in that time period? We could have a very quick burst of information, and then go for a while with no new

information. Who knows how it's going to happen?

David: A lot of our audience was really concerned when you had mentioned in previous episodes that you had been told that we might end up on a negative timeline where we actually had Draco ruling the planet.

But all of the things you've been telling us throughout this sequence of updates suggests that that door has closed.

Corey: Correct.

David: Could you explain for us?

Corey: Yeah, we are definitely redirected onto the positive timelines, but the most optimal timeline, or just a little bit more positive than what the other thing would have been, is up to us.

David: Okay.

Corey: But that is correct. Things have changed in our timeline to a point to where there is no way there could be open rule by the Reptilians.

David: So we were at the point now where the Blue Avians are talking through you, and they say that the Giant Spheres have disappeared, that the Outer Barrier disappeared, and that now this Galactic Federation is protecting our airspace for us. What are the implications of that? Where does it go from here?

Corey: Well, I was told that the only avenue of escape, because of this blockade, was through the portal system, you know, the Cosmic Web.

But, as I've also previously stated, it's heavily monitored at a high level. There's nowhere you can go through these portals that they can't track you down.

They said that whoever did escape through the portals during this time period would be on the run for the rest of their lives.

David: In a recent conversation I had with Pete Peterson, he said, and I quote, "Americans are all over the galaxy", if you get to a certain level of the UFO cover-up, right?

So some of those people would not be good people, I would imagine. They would be Secret Space Program Cabal types.

What would stop some of these people that are still here on Earth now from rejoining those other groups that are distributed throughout the galaxy?

Corey: The Galactic Federation blockade.

David: So those other groups might still exist, but they're not going to get anybody new coming to them.

Corey: Correct.

David: Do you think they might try to come back here and invade us?

Corey: No. There's no way, not with the blockade.

David: Hm. So could you tell us a little bit more about what this Galactic Federation blockade is or looks like, because I'm not sure I understand?

Corey: I haven't been told myself. It is very highly-developed beings that have a military blockade around our Solar System.

So I would imagine they are ships and stations that are preventing ingress or egress from our Solar System.

David: These 52 beings that you saw there, what is their role in this meeting as you're having this communication take place?

Corey: Well, we were told that we were witnesses, that we were the conduits for each of our collective consciousnesses, that each of our groups was a collective consciousness on our planetary systems that we were on, like here on Earth.

The information I was receiving, what I was witnessing, was on behalf of the collective consciousness here in this Solar System.

They stated that all of the 52, 53 including me, were incarnates from this Galactic Federation.

David: Hm.

Corey: This Galactic Federation pretty much had several waves that came to each of these star systems to begin to assist.

We were also each told that on the planets that we're serving, there were hundreds of thousands of Wanderers, basically, that were incarnated there from our soul group. Whichever Galactic Federation group that I'm incarnated from, that I'm here to do work for, I'm not the only one. There's hundreds of thousands from my group that are here, so there's nothing special about me. I'm one amongst hundreds of thousands.

David: How does it relate back to life on Earth now? You're doing this witnessing; what does that mean for us?

Corey: Nothing in a physical sense, just in an energetic and consciousness sense.

David: Okay.

Corey: That's all it really is about.

Now, while we were having discussions, and the different groups were . . . after they had met, you know, the Sentinels after they had met the Guardians, I was told to tell everyone to prepare for the coming of the new Guardians.

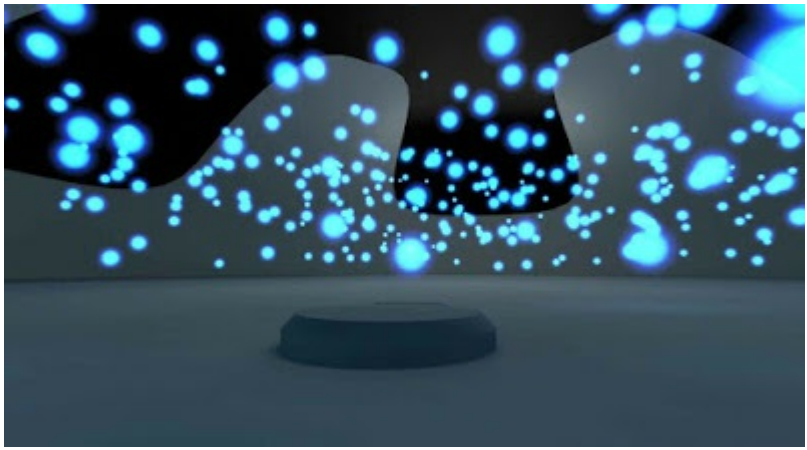
And all of a sudden, there was what I've seen before, felt before, but it was a little bit different, a major flash. But it was like a flash, but the light when it flashed, it went woo, woo, WOO, woo – kind of like that. It was a bright white blue flash.

David: Hm.

Corey: And we felt, or I felt, every molecule, everything, every little molecule in my body vibrating. It was just zhhhhh . . . I thought I was going to vibrate out of my body.

And then the two new Guardians were standing almost across from Teir-Eir and the Golden Triangle being.

The room filled with thousands of blue orbs. I mean, the scene was AMAZING.



David: And what exactly did these new Guardians look like?

Corey: Sadly, at this point, I'm told that I am not supposed to describe or talk in detail about the new Guardians.

David: What's the next thing that takes place?

Corey: Teir-Eir had me address everyone once again and had me address the fact that the Blue Avians and the Golden Triangle beings were going to phase out of our reality, that they were no longer going to appear to us in physical form, that the Blue Avians were going to appear to us, who had been a part of their soul group that were doing certain missions, and guide us in our dream state, and that they were going to teach us to become even more involved in dreamwork ourselves.

Apparently, all of the witnesses, the 53 of us, have been involved in heavy dreamwork, helping people in classroom settings on our planet, and that this was going to increase, and that we were going to start having more memory of it, that our Higher Selves were wiping our memory of these encounters and classrooms . . .

environments.

David: So the Blue Avians appear to be the source of The Law of One. And in The Law of One, they say that they had to descend from 6th density to 5th density in order to help us because we were in so much trouble.

So do you think this means that they are now able to go back to 6th density?

Corey: Yes.

David: Well, that's fascinating.

Corey: Yes. Yeah, they said that they were going back to their realm.

David: Wow! So that's a big deal.

Corey: It is. Teir-Eir said humanity is going through their Great Awakening, and that we are at the precipice of our very own consciousness renaissance.

And that's what we are about to go through right now.

And it was stated that the new Guardians were here to assist us in acclimating to being managers of our own destiny and to assist us in working together with not only the local 52 star representatives, but the members of the Super Federation that were allowed to stay and to help manage everything.

David: Was there a sense of sadness about them leaving?

Corey: No. There was excitement that the new ones were here.

How it ended is: Teir-Eir had me communicate to everyone the same thing that he had me communicate at the Super Federation.

He ended with, “In service to All; in service to the One”.

And then they just slowly faded and were gone.

All we really got from the new Guardians, after Teir-Eir disappeared, was they

communicated, . . . and I can't tell you how they communicated this, but the only thing they communicated were the cosmic ground rules about how these groups could work together.

David: The 52, 53 witnesses?

Corey: And the Super Federation that they were joining – the ground rules for forming, basically, the new Super Federation.

And after they communicated those ground rules, they didn't say goodbye. They just disappeared.

David: Do you have any information you can share with us about what those rules are?

Corey: I cannot share that information yet either. All of the information from the new Guardians has to be kept quiet for now.

David: So how did you end up leaving this room?

Corey: After the Guardians, the new Guardians, disappeared, all of the representatives from the local 52 stars, the witnesses, started getting picked up in Blue Spheres.

David: Oh.

Corey: At that point, I looked over and saw Aree sort of rushing towards me. And so I started to head towards her.

She was very excited. She gave me a big hug and opened up where my clothes were inside the brown satchel.

I reached in, I pulled my clothes out, and she pointed over to an area for me to go and change.

David: You didn't fight to keep the JC Penney clothes?

Corey: No.

David: Ha, ha.

Corey: Ha, ha. So I changed, and as soon as I changed, a Blue Sphere appeared and took me home.

And when I got home it was still the same day. I had only been gone for like 10 minutes or so.

David: Oh, wow!

Corey: And I had had days of encounters packed into 10 minutes.

David: Well, that's very fascinating.

So **Corey**, I, again, want to thank you for being here. And I want to thank you for watching. This is “Cosmic Disclosure”. I'm your host, David Wilcock here with Corey Goode.

Briefings with a New Alliance Season 10 Episod 7

Cosmic Disclosure; Briefings with a New Alliance Season 10, Episode 7

04 Apr 2018 [images blocked]

David Wilcock: Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock. I'm here with Corey Goode. And in this episode, we're going to discuss the fascinating return of the Secret Space Program Alliance *[SSP Alliance]*.

Corey, welcome back.

Corey Goode: Thank you.

David: So let's take it forward then from what you had here in our previous episode. What is the next noteworthy thing that happens to you after this awesome series of visitations that you experienced?

Corey: Typically, after I have an experience like that, I spend days just sitting and staring at the wall trying to process it all.

I was kind of going through that process when I was informed that I was going to have a meeting with Gonzales and the SSP Alliance on the LOC *[Lunar Operation Command]*.

David: Oh!

Corey: And, if you remember, they had been keeping their head pretty low for a while, and they had gone through the trouble to make me feel responsible for the near collapse of the SSP Alliance.

If you remember, Sigmund was picking me up and chemically interrogating me to find out what was going on because he was a part of the MIC Secret Space Program *[Military-Industrial Complex SSP]* . . .

David: Right.

Corey: . . . and didn't believe any of this other stuff was going on. He just didn't believe it.

David: Yeah.

Corey: And then once he did his investigation, he found out that it WAS real, and he

started causing problems, and then he just disappeared off the face of the Earth.

David: So how did it feel when you heard that the SSP Alliance is reforming?

Corey: I was a bit nervous. I didn't know what to expect.

I knew that they were going to want a full briefing of all the different things I'd encountered.

David: Right.

Corey: So I was really still processing those. I wasn't really in a place to give a briefing, but I was going to have to, anyway.

David: So this is right around the time that you had, kind of, moved in to your new place and had been able to settle down.

Was there any relationship between that move and some of the things that started to happen to you at this point?

Corey: Well, very quickly after I moved in, in October, I took my son around and did some “trick or treating” [Halloween evening] to kind of gather a little intel on neighbors.

And the people directly across the street from me, the man and the woman, both, were retired CIA. They were geologists that did some sort of satellite interpretation, you know, for the CIA.

David: Retired CIA.

Corey: Yeah.

David: Right across the street!

Corey: Right. And then . . .

David: That's petty crazy.

Corey: . . . he started telling me, “Yeah, the lady next to you retired from NOAA . . .

David: Right.

Corey: . . . the National Oceanic and Atmospheric Administration.”

David: Yeah.

Corey: “The person over there is retired military. This whole area . . . there are a lot of retired Air Force and intelligence assets.”

And that freaked me out. And I brought that up to Gonzales the next time.

And he told me that indeed that was true, and that all around my neighborhood, they had installed all types of very sensitive detection devices that would detect any type of electrical change in the atmosphere – any types of changes.

David: Well, who is “they”?

Corey: Military intelligence. They were trying to figure out what was going on with me.

David: Okay. So does that include trying to catch something happening to you like the Blue Sphere picking you up [Corey nods his head “yes”.], or the Darts landing [Darts are small craft used by the SSP Alliance]?

Corey: Or me being teleported out. When that occurs, there's some sort of weird energetic signature that they are able to track with these devices.

Also, if any craft were to come and pick me up, they would be able to gather telemetry on the craft.

David: Well, some of the things that you and I have discussed privately have made me pretty compelled in thinking that the Earth Alliance is now taking you a lot more seriously than they were.

Corey: Yes.

David: And would you agree with that?

Corey: A lot more seriously, but they're very skeptical of anything involved with the Secret Space Program.

David: Do you think, though, that they are starting to feel more compelled based on certain things that they've acquired?

Corey: Yes. And they were also trying to figure out how a guy who was talking about 8'-tall blue bird aliens was also coming out with all of this very accurate intel about what was going on in the MIC Secret Space Program.

David: Do you think, or do you know, if those devices that they've installed have actually hit pay dirt and gotten them something that they find very amazing?

Corey: I don't know, because I was told the day of this meeting I needed to leave my home and drive to a local school and be prepared to be picked up in a football field.

David: Wow!

Corey: And that's exactly what happened. It was around 2:00 am. in the morning. I got dressed, got in my car and left.

And I parked and waited for about 20 minutes beside this school, and sure enough, I saw . . . off in the distance, I saw a flash. And the it flashed again and it stayed on. It was like a white orb up in the sky.

And it was descending very rapidly and then started moving towards me and getting a little bit bigger.

And then as it got probably a quarter mile away, it was like the light popped like a bubble. If you blow a bubble and pop it.

David: Oh, that must have been so cool.

Corey: Yeah, it was very cool. It popped and there was a Dart craft . . .

David: Really!

Corey: . . . that I had ridden in before.

David: About the size of a regular car like you would see?

Corey: Yes. About the size of a . . . a little bit bigger than an SUV.

David: Right. Wow!

Corey: It came and it landed. I had quite a distance to hoof. It wasn't real close to my car. But I'm looking all around, looking for any types of cars or aircraft lying around and it was just dead still.

I sit in and they tell me, “Sit back; buckle up. We're headed to the LOC”.

We lift off, and I see the Moon as we're headed towards it. And the Moon looks about like this big *[Corey makes a circle shape with his fingers of both hands touching each*

other.], and then all of a sudden – Whew!

I mean, it grew so quickly, so fast, that it looked like we were going to smash into it.

David: Did you have a feeling of motion?

Corey: Kind of a feeling of motion. I mean, you see the Moon and all of a sudden, the Moon looks like it grows just super fast. "Vrooooo!" And then, all of a sudden, you're like . . . you can't see the circumference of the Moon anymore. You're so close.

They flew back around the back side of the Moon.

And we did two or three flyovers of the crater that the LOC is in, except we couldn't see it.

They had the masking technology activated.

David: Oh, wow!

Corey: So it just looked like a crater. I mean, you couldn't even see the secondary crater, the hole in the bottom of the crater. It was all covered up.

David: Was there anything kind of glitchy about it, or did it look really clean?

Corey: It looked really clean.

David: Wow!

Corey: I was told that it had kind of a mirage effect, but it looked pretty clean to me.

David: Wow!

Corey: And so they were communicating, getting permission to land, and then the masking was turned off and I could see the base.

And I could see green lights, red lights, white lights, some flashing, some stationary.

And we flew around, up and over, and down in this secondary crater hole that's in the middle of this crater that the LOC is in.

And we flew down through it . . .

David: So the crater was just open?

Corey: Yeah. It's just a hole.

David: A chute?

Corey: It's kind of a hole that goes down, almost like a sinkhole, . . .

David: Okay.

Corey: . . . then it opens up into a lava tube cavern.

David: But was there a lunar surface looking underneath it so that if you didn't actually get really close, it would just look like a crater?

Corey: No, it just looked dark.

David: Right. Okay.

Corey: Dark, like a hole. We head into that and immediately, I see the part of the LOC I've seen before, the part that's kind of like a bell shape going down into the rock.

David: There's a cavern around the bell shape?

Corey: Yeah, it's a cavern that the bell shape was built into.

David: Oh!

Corey: Like the middle. It looked like it went all the way through, and then the bell shape was built that kind of blocked it.

David: Interesting. Okay.

Corey: There were two main hangar ports. One was for exiting craft. One is for entering craft.

We entered in. We went and landed in one of the areas to where we disembarked. The pilots immediately went down some stairs, and Gonzales greeted me.

He was wearing an Air Force dress uniform.

David: Hm.

Corey: And I looked at him, and I said, “We're back to that old charade, huh?”

And he got a look on his face like, “Shut up! Shut up!” You know? So, I kind of . . .

David: Why would the Air Force be a charade?

Corey: Because he was Navy.

David: Oh!

Corey: And he, throughout the Secret Space Program Alliance, he was pretending to be Air Force.

David: Oh, interesting.

Corey: And I had given that information already in intelligence briefings to the public, so I didn't understand why he was wearing the Air Force clothing.

David: Okay. Yeah. Interesting.

Corey: So we met a female that was wearing Air force clothing. She introduced herself to us and said that she was going to be our escort for the remainder of our visit.

David: Now, were these jumpsuits as you've said before?

Corey: No, she was dressed in an Air Force dress uniform.

David: Okay.

Corey: You know, had her hair kind of back and tucked, and tied. And it looked like Air Force dress.

David: Just regular Earth Air Force uniform?

Corey: Um-mm.

David: Okay.

Corey: She takes us immediately into an elevator. And we get in the elevator, and it starts going . . . It goes VERY quickly down. It goes very quickly down.

I couldn't count floors or do any type of intel.

David: And then what happens?

Corey: So when the doors open, I knew that I had gone MUCH further down into the LOC than I had EVER been permitted prior, or at least remember.

And when the doors opened, I was expecting to see all kinds of magic, and I was immediately disappointed. It was corridors and doors, was all I saw. So . . .

David: Would you have been able to know you were on the Moon if you were just transported there?

Corey: No. No, you would not know the difference. You would not know if you were on Earth. You wouldn't know.

David: Right. Okay.

Corey: So we were guided down a corridor to a room, and she knocked on the door at the same time as opening it. And when she did that, there was a conference table and what looked like a big window behind them. And the conference table was turned this way *[Corey indicates the conference table is in front of him with him standing in the middle of a long side of the table.],* and the window was this way *[The window is opposite Corey on the other side of the conference table.]*

And everyone at the table stood up – or almost everyone. Everyone that I could see stood up.

David: So what's in the window?

Corey: The window . . . I see Mars. It looks like we're on Mars.

David: Really?

Corey: And I was kind of perplexed. You know, the people are standing to greet me, and I'm like, "Are we on Mars now?" Because I've heard you give information about some insiders that they would ride an elevator, and then all of a sudden . . .

David: That's right.

Corey: . . . they're on another planet.

David: That's right.

Corey: And I was wondering if that had just happened.

David: Yeah. They called it the corridor, and it was a teleportation device. Yeah.

Corey: Right. So I was a little confused.

And immediately, one of them turned and saw it and changed it to a moonscape.

David: HA! Ha, ha.

Corey: So, basically, from talking with Gonzales, a lot of times, people . . . If you're working on a project, they'll take you through a portal without you knowing, and you'll be on the Moon or Mars.

David: Oh, wow!

Corey: And they can show what looks like a convincing window of somewhere on Earth.

David: Wow!

Corey: So you would think you're on Earth. Or if you're on Earth, and they want you to THINK you've been to Mars, they can do it that way, as well.

David: Very interesting.

Corey: So I immediately looked around, and I recognized everyone there, everyone present. And I look over, and . . .

David: Recognized, meaning what? Like who were they?

Corey: The Secret Space Program Alliance officials that I had met before.

David: Oh! Okay.

Corey: They looked very uneasy. Like meeting Gonzales and I for the first time in this situation made them very uneasy. It wasn't hard to read that.

David: To your knowledge, do these people ever come to Earth, or do they exclusively live in space, off planet?

Corey: Some of them, yeah, they do come to Earth, but most of them have been completely pulled away and segmented from any type of life going on on Earth.

They stood up – which is kind of the military thing to do, you know; when people come in the room, you stand up – and did a greeting with Gonzales and I. And like I said, they were nervous.

But as they were starting to sit back down at the end of the table, I saw Sigmund.

David: Oh, really?

Corey: And Gonzales and I were both sort of shocked and perplexed to see him. I sort of blurt out without evening thinking.

I was like, “Wow! So this is where you've been?”

And I looked around . . . I glanced around real quick, because everyone was very uncomfortable still, and I said, “I'm kind of surprised to see you here after I told the SSP Alliance that I had the feeling that you were infiltrating.”

And he didn't like that at all. He stood up and started frothing at the mouth.

He went from sitting there with a smirk on his face to standing up doing this *[Corey points his right index finger down, up, down, up, repeatedly]*, saying, “You don't know what all I've lost. I lost everything.”

And then he pointed his finger at me, and he said, “Intuitive empath, my ass!”

David: Hm.

Corey: And then everyone was real quiet.

David: What do you think he meant by, “I've lost everything”? What does that mean?

Corey: Later on, I heard he basically abandoned his family and everything here.

David: Really?

Corey: Yeah. He abandoned everything.

David: To join the SSP Alliance once he found out it was real?

Corey: Yeah.

David: So could you just again, very briefly, tell us: what was his role before and why is this important?

Corey: Yes. He was very high up in the Military-Industrial Complex Secret Space Program.

He was being charged to investigate what was going on with me with the leaking of highly-classified information.

David: And so just to clarify, the MIC program doesn't know about the greater program that you were in.

Corey: Right. So I'm coming out with all these interesting tales along with classified information, and they were wanting to figure out what was going on. So he brought me in.

They were fairly sure I was a part of a program, and they put me through the paces to figure out if I was telling the truth or not.

They did forensic tests on me to see if I had been in the places I said I was.

And after finding out that what I was saying was true, or he could verify most of it, he soon broke away and joined the SSP Alliance.

And that's pretty much how everyone had joined. They had, at some point, pulled away after they found out more information.

David: So it must have been really shocking for you to see him there, considering that in the past, he didn't even believe that your Secret Space Program existed.

Corey: Right, but he's still a skeptical guy. As the briefing continued, he showed his skepticism.

But after his outburst, there was kind of an awkward pause when someone on the opposite side of the table said, “How about we sit down so we can begin?”

So we all sat down and then the briefings began.

David: Okay, so what were the briefings?

Corey: They're basically the briefings that I've been giving all of our viewers the last several episodes.

David: Oh! You were briefing them?

Corey: Uh-huh.

David: Really?

Corey: I was getting briefed as well. Gonzales and I were both getting a joint briefing. Most of that is classified still.

Gonzales gave his briefing, and a lot of it was classified, but a lot of it also had to do with the different beings that he was working with alongside the Mayans and the work they were doing.

I gave my complete briefing, and the moment I brought up the Super Federation and started to give the briefing, and I mentioned Teir-Eir, the Blue Avian, appearing, Sigmund sat back and threw his arms up and scoffed in disbelief.

David: After all that?

Corey: Yeah.

David: So why do you think he still would disbelieve if he's actually discovered the SSP Alliance is real?

Corey: Well, I asked him. I said, “After everything you've seen, now that you've joined the SSP Alliance, you still don't believe?”

And he said, “I've had technology used on me to where I don't know if THIS is real.”

He said, “The technology that's out there can make you see whatever it is they want you to see.”

He said, “I am fairly certain that the Nordics are screwing with our heads again.”

David: Hm.

Corey: And I was about to ask him, “What do you mean, 'again'?”, when that same person at the other end of the table called us back to order.

David: Well, given the fact that you were put into, as you've described, virtual reality simulations in the MILAB program when you were a kid that you said were indistinguishable from reality, do you think he has a point? Do you think he could be right?

Corey: He absolutely has a point, because from his perspective, he's been put through a lot of those technologies to a point where he doesn't know what's real half the time from what he was saying.

David: Right. But I would say, from all that you've described, that there are layers of

this that make it very clear that it's not just Nordics playing a game on you, that this is actually a real phenomenon with real beings.

Corey: Right. He went on to say, “Listen, I saw the video of the first meeting at the LOC where the Blue Avians and the Golden Triangle-Head being appeared.”

And he said, “I saw it, but I don't believe it.” He refuses to believe it.

David: Is that a pretty forlorn opinion that most people don't share? Is he kind of in an isolated role by feeling that way?

Corey: Well, all of the people that were there at the LOC meeting, that were there when the Blue Avian appeared, were pretty convinced that it was real as well.

So it was just that he had not . . . He was going from his previous experience.

David: Well, let's talk about this for a second. If he believes, and he has reason to think that the Nordics have enough technology that they could make you see whatever they want, why couldn't they, for example, project a President of the United States and just replace him or do all kinds of weird things to mess with our history?

Corey: There's only so much they're allowed to do, cosmic law-wise. But apparently, Nordic species have been involved with us ever since we've been here.

There are tales of angels, tales of beings appearing during the founding of the United States . . .

David: Right.

Corey: . . . that were described as being Nordic-looking. So they've been here with us all along.

I don't understand though, quite yet, what he means by, “They're playing with our heads again.”

David: But you were under the impression that most people did not believe him in that room.

Corey: Most of the people didn't agree.

David: Right. So what happens next?

Corey: Basically, I finished up my report to them and then received around a dozen

questions, as Gonzales did as well. He received several questions.

And then I was done with my part of the report.

David: So was there anything interesting that was said after you finished your briefing?

Corey: They brought up some of the plans that were in motion to disclose the MIC Secret Space Program.

David: Hm.

Corey: And one of these had to do with a conflict with North Korea – how they would bring to bear space-based weaponry and exotic aircraft.

David: Now, just so that we're clear, what is the fully-awakened view of North Korea in terms of who is really responsible for what they're doing and what is the agenda?

Corey: That's a huge conversation in its own, but basically we can say it's a Cabal puppet state.

David: Okay. So why then are they trying to nuke the U.S. or threatening to nuke the U.S.?

Corey: They always need a bad guy, the Cabal, to leverage against us. In this case, the Alliance is leading the military, the Military-Industrial Complex, SSP, as well. Most of it is now under Alliance control – Earth Alliance.

And they want to disclose this program from a place of strength. So they feel that if they use the weapons that they've been developing for decades on North Korea, that it will send a message to the rest of the world while at the same time releasing advanced technology to the public.

David: So they would actually intend for this to be filmed and seen and talked about on headlines all over the world?

Corey: Right. Just like when war broke out . . . I believe it was with Iraq when the Stealth Fighter and Bomber came out of secrecy.

David: Just because this has been so controversial on the Internet, I want to ask you this: What could the Cabal do to a country like North Korea to get them to poke their finger in the eye of the big bully on what would appear to be like a suicide mission?

In other words, they don't really have hardly anything, but they're acting as if they're going to drop a nuke anyway.

How severe is this military threat that we would pose to them? Are we going to wipe out their entire country and turn it into glass? I mean, what is the scope of the attack, because a lot of people are really worried about this?

Corey: Right. Well, the scope of the attack, from what I've heard, is that we recently – SpaceX – launched a DoD *[Department of Defense]* device that is a sustained EMP *[electromagnetic pulse device]*.

They're going to use that over North Korea, hit it with an EMP, and then begin to drop some of the Rods from God – large, long, about telephone-sized tungsten beams that are coated in ceramic.

David: Okay.

Corey: It is planned that they'll be dropped, and that then TR-3B-type craft will then come in and do surgical sorties.

And they're going to try to take . . . not damage the infrastructure – what there is of infrastructure. They're trying to go for low casualties.

David: Okay. So those tungsten rods that you just mentioned, are they like bunker busters? Are they able to get deep, underground military bases taken out?

Corey: Absolutely.

David: How could somebody convince Kim Jong-un to be doing this? I mean, the guy . . . He's obviously not going to live through this.

How could the Cabal actually make this country pick such a huge fight that it knows it can't win?

Corey: Well, we're not talking about a country. We're talking about one insane leader who they are able to manipulate.

David: So there might be blackmail involved or bribery or some other type of threat-coercion factor.

Corey: Right. In the course of this discussion, they brought up the Tom DeLonge effort of bringing out advanced technologies and in disclosure.

David: Right.

Corey: And they've stated that he was working in tandem with the Air Force part of the MIC SSP, which is also the DIA, the Defense Intelligence Agency.

And as they started talking more about THAT program, and how they were doing it independently of ufology – they did not want to work with anyone in ufology – and I was curious about that, obviously, and they basically stated that ufology had been so infiltrated by Illuminati cults, by egotistical narcissists that really just are there to talk about their material and create UFO-type religions. It's a mess.

And they say that if they want the, I guess, the rest of society to take this information seriously, they felt like it had to be done completely separate from what was going on in the ufology realms, which is disappointing.

David: Yeah. I mean, that's kind of like fighting words. It's you putting your gun on the table when you say that, really.

So how can we marginalize this whole community like that? That doesn't seem really fair to say.

Corey: Well, it's not fair, but they do have their points. There are a lot of problems in this community.

But if we want to be a part of it, we're going to have to make a stand and just be a part of it by default.

David: Has there been a psychological profile of why they think people in our community are so ill-equipped to handle a genuine briefing or genuine disclosure?

Corey: Well, part of the problem is that the Military-Industrial Complex has been screwing with ufology for decades, feeding in misinformation, sending in operatives to cause fighting and infighting, sending in people with different narratives.

I mean, some of the Illuminati-type cults have been coming in with their religious narratives trying to cause us to adopt them, to make it to prime us for some day when they come up, they show us what's going on in Antarctica and claim to be divine right rulers, that we will agree.

David: So I just want to get a little bit more direct in how I ask this of you.

Are you saying that there are certain people who would be recognizable figures in the UFO community who are actually working on a secret payroll and are having kind of

a double-agent role in what they're doing?

Corey: There have been instances of that since ufology began, absolutely.

David: Hm. So how would our audience know who to trust in light of that information? How should the person hearing this respond if they're told that our entire community is in such a state of disarray right now?

Corey: Well, I guess we just need to begin to hold our UFO belief systems – we all have them – at arm's length and start to focus on getting Disclosure.

None of us really know the real truth, but we all want it. So if we all focus on what we're desiring as opposed to what we've created in our minds over the years, then we'll find a way to work together.

Otherwise, we are just at each other's throats. My information doesn't match your information, therefore you must be the Devil. And it's just a big mess.

But at the same time, there are a lot of really great people in the community, that if they come together, they will be able to be a MAJOR part of Disclosure.

David: So were there any other topics that you discussed at this meeting besides what we've already mentioned?

Corey: Actually, Sigmund kind of dropped a couple of bombs real quick.

David: Ha, ha.

Corey: He told us that we were going to get a very exclusive tour of the Lunar Operation Command, which definitely got my attention. And then, . . .

David: You said before you only got to see the top, right?

Corey: Right. I was already further down in the LOC than I'd ever been.

David: Wow!

Corey: And what's interesting is he said that the tour would begin at LOC Bravo.

Now, one of the things that I've kind of kept to myself, and it's so you can tell who is real when they come forward, is that there are three LOCs.

David: Right.

Corey: There's LOC Alpha, which is the one that I've always talked about, LOC Bravo, and LOC Charlie. And by the end of this trip, I get to visit all three.

David: Well, Corey, I hate to say this, but we are out of time for this episode. This is “Cosmic Disclosure”. I'm your host, David Wilcock, here with Corey Goode. Thanks for watching.

Confirming Underground Civilizations Season 10 Episod 8

Cosmic Disclosure; Confirming Underground Civilizations Season 10, Episode 8

DAVID WILCOCK: All right, welcome back to Cosmic Disclosure. I'm your host, David Wilcock, here with Emery Smith. And in this episode, we're going to start talking about underground civilizations. Emery, welcome back to the show.

EMERY SMITH: Thank you, David. Glad to be here.

DAVID: In the past, you've talked to me about a very interesting technology that apparently can see quite a bit more below the surface of the earth than what our conventional scientists would think is possible, so could you talk a little bit about that first.

SMITH: Yes, sure. I mean, it all started using satellites, of course looking into the oceans. Of course, the astronauts also while orbiting, would look into the oceans and see these crashed, old wreckages, and ships that they knew, of course, had a lot of gold in them. And treasure hunters also started dealing with the inside governments to buy time on these amazing satellites that could see these things.

DAVID: So this is not something that conventional people have access to.

SMITH: No. No, they don't.

DAVID: This is an insider thing.

SMITH: It's an insider thing. There are a couple of organizations that do own satellites, or private corporations that use them for looking into walls to see if they're infested in foreign countries with like insects and bugs, believe it or not. So they can see, actually, inside a wall from a satellite and see what kind of bug it is and tell you what kind of bug it is. So that has now been an advance to look into the ground, a little bit. But they have developed a special radar, now. It's a ground penetrating, low frequency, back-scattered wave pattern device, which gives you a volumetric image that's about 400 times better than a CAT scan. So you can actually see what it is and you can also tell what type of material it is, which is very helpful. Let's say, in Saudi Arabia, for the Kings there, if they have a backpack bomber running down their driveway, they could just basically fly the drone over it or shoot the wave at them, and they know how much explosives he has in his backpack before he even--you know--gets near the compound.

DAVID: Wow.

SMITH: So this type of device has been used by the military and for the DOD. I can't say who has this or--but it is privately owned.

DAVID: One question, real quick. So we have the periodic table of the elements--we're up to 120 something.

SMITH: Right.

DAVID: Are there certain elements that you can't see with this? Or how does work?

SMITH: If it's not elements that have already been discovered, you will not know what is--the way that comes back will be unknown, or unknown from earth.

DAVID: Right. But as far as the rest of the periodic--

SMITH: Everything is logged into this. Like a rife machine with frequencies, they have done the same thing with this device. So they have measured every type of element that there is, and have measured how that frequency comes back. That's why they can build, not only a volumetric image, but actually tell you exactly what it is. A good--one of the great things about this device is I can put it on a drone, fly out to an oil tanker--and this is the test we did--and in one of those giant tankers that hold hundreds of thousands of gallons of oil, we could put a small amount of uranium inside a sealed box, inside a 55 gallon oil drum, drop it to the bottom of this tanker, and fly this drone over 10 miles before it even gets into port, and it will tell you exactly where that uranium is and what it is and where on the ship it is. It's that detailed. So it's a very amazing, useful, protective thing we have, that I hope many people listen to this. And I hope the--POTUS kind of knows about it, but doesn't know about it kind of thing. And I think this would help him in the fight against terror, because this way it will scan everything and you will know everything before it even happens.

DAVID: Wow.

SMITH: It's a very--so when we were hired, my team, to go out to look for, in an undisclosed location in the United States of America, to go remote view an area that has been known--has been getting these hits of a possible gold reservoir, we went out and met with the scientists and this amazing team, and they were looking for a special treasure, I'll say. And, I can get into that later. But the thing is, they were looking for a special treasure. They hired a colleague, a couple colleagues of mine and myself, to go out there and to first lay the flags on the mountain where we thought it was. And we were--

DAVID: Yeah, and let me just say Emery that--for you folks watching this don't know this, but you and I do--I actually got to talk to your team. So this was not just something that I'm hearing from you now.

SMITH: That's true.

DAVID: And it was something we were very involved in for a while.

SMITH: Yes you were. Yes, absolutely. So what had happened is we went out there, we laid down the flags, they ran this special radar over it, and we were 99.9% percent effective. So we--

DAVID: In what?

SMITH: In finding out where the gold was at.

DAVID: So there was a large amount of gold--

SMITH: A large amount of gold. They were after these treasure hunters that was working with the government, I believe, maybe, maybe not. That's a speculation. So--

DAVID: But the really cool part of the story--

SMITH: The really cool part of the story is a scientist called me in that developed this system--an amazing person--and my team in, and sat us down, a few of us, and said--showed us this giant void underneath the earth where--way deep below the gold. And we were like, well, what's this giant hollow space here? And what is that giant pyramid? And he said, how did you--how did you know about that? How did you--did you go through my files? I said, no, but we saw it when we remote viewed it. And I said, well, why didn't you write that in your report? He says, because it came back unknown elements. And I'm only out here to do one thing, and that's to find--to confirm the gold. And I said, this is the most amazing, groundbreaking thing on the planet. And he's like, yeah, well, with my device, I can see all the way through the earth and see everything in the earth, so just think what I have already seen and what am I going to do with this information. This was the same technology they used to find the tunnels in Mexico that were coming through the borders. They used this technology. And the Mexican cartel actually put a hit out for this man because they found out, because the government was already infiltrated as well. So even though he saved US--you know, bless this man that he had helped and came to the forefront and saved US with his technology. He also almost got killed for it. So we found, not only that, but we also found a lot of other interesting things, and the pyramid there were like 10 times the size of Giza. So it was a very big void, here, in North America. A very large, large area and a large aquifer kind of surrounding it. And its own atmosphere. And he can measure atmospheric pressure, too, which was interesting. So

with this device, he can do so many different things. So there are civilizations, I can confirm, that have their own atmosphere, their own luminescence, their own life, and their own water supply that are deep within the earth.

DAVID: Well, you also had mentioned to me, when we talked about this before, that there were some, I believe, cubicle rooms that you guys found, that didn't have any entrances or exits.

SMITH: That was the very interesting thing. The back-scatter radar, low-frequency radar actually showed cubes--these giant cubed rooms and small cubed rooms of emptiness that were perfectly cut. We measure using--we can measure exactly to the millimeter how big these rooms are and how small they are and they were cut like perfect cubes. And this bedrock--we're talking about 1,000 feet down to 3,500 feet down. And it's like how on earth are these cubes down there, near this area, by the way? And maybe there is something inside those cubes, but we don't have the technology to see it or to analyze it, because it just comes back as unknown. And one of the elements that we discovered--that why we were called in, and some of the things they found down there was a huge reservoir of pure white gold. White gold, not meaning--the gold that is mixed with metal today, like white gold on your chains--we're talking about from ancient civilization, white gold--the powder--the mana. The mana that you hear about.

DAVID: And you said, when we were talking about the smart suits, that there was a white gold fuel that would create antigravity in the smart suit.

SMITH: That is correct.

DAVID: Is that the same type of stuff?

SMITH: Yeah. And it was interesting, because--

DAVID: I mean, this was very fascinating.

SMITH: --the government moved right in and bought pretty much all the property up until this part of this land, which is a really great confirmation.

DAVID: Right. I also remember you showing me some of the volumetric imaging of what clearly appeared to be a stairwell that had been back-filled. So could you talk about that?

SMITH: Yes, we found giant stairwells, underneath the ground. And these giant, huge voids--we're talking, hundreds and hundreds and hundreds of acres that go on for thousands of miles. And these are not just caverns. They're caverns, but they're also something different about them, because there are certain parts of the caverns that you

can't make it up where there's an actual steps--steps going thousands of feet down--perfect steps. We did find the outlines of craft and also a large sarcophagi.

DAVID: So do you think these were giant humans of some kind?

SMITH: Yes. They were about 30-33 feet tall.

DAVID: Wow. So, that's the older stuff, for sure.

SMITH: Yes. But we did find something on the radar that was really cool, too. And that was in the middle of the aquifer was a large, large rock that did not look like it was connected to the mainland. And it was just there. And I'm talking a few miles--

DAVID: Like a boulder, a massive boulder.

SMITH: So imagine water going over the boulder and the boulder was hollow and did have a type of ruins in it.

DAVID: Oh, Wow.

SMITH: Right. And one of the reasons that we needed the suits was actually to drill and then go through the aquifer with the suits and then drill into that. But the problem is we didn't want to flood it. We couldn't find out a way how not to flood the giant egg. Because that would wash away all the white gold.

DAVID: The white gold was inside the egg?

SMITH: In that egg, yes.

DAVID: Really?

SMITH: Yes.

DAVID: And it was all submerged?

SMITH: Yes.

DAVID: So how would your smart suit help you to get into the egg? Could you just bore through it with the suit or something?

SMITH: Yeah, there's a way that you could bring equipment and bore through it, but you couldn't--the thing is, we wanted to find out if there was an air cavity somewhere around it. Because for some reason, we couldn't find that. So--but there was a part of the rock that was close to the surface of earth that was touching. So we figured, you know--and once we did drill through, water started coming out. And it was only three

feet to the giant rock. So you have billions of pounds of water coming through this little hole you just dug down deep into the earth to get into this egg. And now you have three feet preventing you from getting into the egg. So how do you--so what we decided was let's bring down billions of gallons of liquid nitrogen, freeze that part of the aquifer, then drill through it, and then go in.

DAVID: Do you think this egg was actually, maybe, some kind of hollowed out asteroid, and they could have phase shifted it and landed it inside the earth?

SMITH: I think, that at one time, it was an asteroid and that somehow it was formed to the earth, probably through molten lava or something. And over millions--over years, the water somehow broke it off from the earth. And now it's just kind of in this area surrounded by three feet of water. And we're talking about a very highly pressurized area.

DAVID: Wait a minute. An asteroid would have come from the solar system. So are you saying, you think it formed in the earth?

SMITH: Well I think it came a long time ago. People found this as a safe haven.

DAVID: Oh, it was a crashed asteroid to the earth, from ancient times, and it's a massive boulder basically inside the earth that they found and could hollow out.

SMITH: Right. It was probably--it could have--right. They probably hollowed out, or could have been hollowed out. And then, for hundreds and hundreds or thousands of years, people were just putting their treasures in there and they're safe stuff, through a very long time. And then, I think now, it's just a--earth itself has just consolidated it in a place where it's very, very difficult to get to.

DAVID: I mean, you're being sort of intriguingly vague when you say ruins and civilization, could you be a little more specific about what's inside the egg? What does it look like? What would we see if we got to ever see this someday?

SMITH: Well, in that egg are those steps that we talked about. So we do have the volumetric imaging for that. So there are steps leading down into this giant cavity. And the problem is the water getting in there. Now to get into more of what is exactly in there, I already told you there is a craft, there's a sarcophagi. And that's what I was talking about was this cavity.

DAVID: And this was some kind of race of giants, then?

SMITH: Yeah, at one time. But over time, I think, people thought this was a special place. And also inside this giant asteroid or whatever it is--I'm not sure if it's an asteroid, just so you know, because when the back-scatter things come back, we get a

lot of different minerals there and different things. And we didn't see a huge amount of iron. But it's just weird that this thing is a giant, hollowed out rock in the middle of the aquifer. It's kind of just intriguing. This is just speculation that it is an asteroid--we think, maybe, maybe not. And so inside this, we have seen many remains of humans--over 300 remains of humans. We have seen also armor. We've seen, of course, caches of gold, the world's largest barge could not even hold. To the side of this giant area, which is very high, as well, inside, it's split up. So it's not just like one big giant area. You have other areas, like I said. The cubes, also, are around the outside of that and on the inside of this thing. So there's solid parts inside this egg. It's called the egg. And inside that, are many different types of tunnels, and hollowed out areas, and pyramids, and sarcophagis, and craft, and other things.

DAVID: Is there anything unusual about the skeletons, besides maybe their size?

SMITH: Well the armor and the pots that we have seen full of gold are the same ones they've used back around the Knights Templar era.

DAVID: Really?

SMITH: So we have a good feeling that this is where possibly the Ark of the Covenant and the Holy Grail and 1700 tablets--stone tablets are there.

DAVID: So you think it's possible that the Knight Templar people might have known about this, perhaps, through, who knows what--ancient texts, or surviving extraterrestrials they were in contact with.

SMITH: Well, I can tell you how they knew about it.

DAVID: How did they know?

SMITH: There is a small percentage of humans who can see in a special blue light spectrum. And for some reason, this gold emanates through the earth and foliage, and they can see this hue. They have this special ability. You could probably--I've never read about it online. I've just been debriefed about it in the military. And people are like this are used to find huge gold reservoirs and also do other things around the world, to help America and keep it safe. And they have, through satellites, found a ping in this particular area of North America. And back then, the Indians and the people over--even if you are in Europe, and they could see over the horizon this blue exact hue. So they would sail all the way to this place, find the gold, get the gold, and they were very successful. So they kept going. And finally, they landed in Corpus Christi--one of the ships from the Knights Templar. We believe that they trekked in somewhere up into North America, which I can't disclose, and then buried it in this area that already had the world's largest gold reservoir, because they thought this would be the safest place.

DAVID: Very interesting.

SMITH: Because they were worried that during the war, that they better move--the Sinclair family took all the money and helped pay for the ships and the Templars helped them. And the Templars stayed to protect the gold till death.

DAVID: One of the other things I've heard that I think is really important to bring up right now, is several insiders have talked about the Sahara Desert, the northern third of Africa. And it's all a big desert now, but they have all said that if you go anywhere between 40 to 400 feet down in that sand, that it is just amazing, and it's everywhere--massive ruins of a civilization. Have you heard about this?

SMITH: I have heard about this.

DAVID: What do you know about it?

SMITH: All I know is they did that with a ground penetrating radar from a satellite. It was very simple, because it wasn't deep. And things that are not too deep they can actually see through, a certain amount, especially sand. But it's harder with bedrock. And there are some anomalies right there that have exactly what you just said. And I heard that--that's not second-hand information. I overheard that while I was in a briefing that had to do with something else over in that country.

DAVID: How prevalent do you think these voids of cubicle rooms are? Like--you only looked at one place. Do you think that most of the places we look, we might find that kind of stuff?

SMITH: I think this is a significant area. And just so you know, this is hundreds and hundreds of square miles of area that we have checked out. It's not just like one certain area. But that's a very small part of the planet is what I'm getting at. And there was significant enough data there to prove that there was a civilization there and it is connected to other civilizations and other tunnels. And that the major aquifers under ground are all connected, which is very scary, which we never did know about. So if the water does get contaminated, let's say in Wisconsin or in North Dakota, South Dakota, eventually over many, many, many, many years all of it could be contaminated. So there is an underwater system of travel, as well, that links all these things.

DAVID: We've heard, from certain insiders, that there is a traversable underwater channel that can go from the West Coast of the United States all the way to Nebraska and that there's a significant military base there and that's part of how they access it, is underwater.

SMITH: Yes, that's true. I mean, the military's been going from the east and west

coast using the aquifers for a very long time.

DAVID: Really?

SMITH: Yes.

DAVID: Wow.

SMITH: I like the Naval sea base that's in the middle of Nevada there. What's that one called? You drive by on the way to Vegas, or whatever.

DAVID: John Lear said that was a submarine repair base.

SMITH: Yes. Yes, I know the Lear family. It's absolutely true. And it's like a stopping station. And it does go all the way across. I don't have the map for that. But I definitely 100% know it goes all the way across, because there was a secret study done using special dyes that they used. And that's some--a group went in there--a private organization and tainted the water and the water off San Diego with these special molecules--very organic--couldn't hurt anything. And then it was about a few weeks later they did collect them in the Atlantic Ocean. So it's definitely--has a--some sort of throughway--thorough way through that entire place.

DAVID: Would you say that even people serving on like a nuclear sub might be using these routinely?

SMITH: Yes, I believe so. And also a lot of clandestine stuff is--that are being used for. And there's bases, also, on the way there that are underground.

DAVID: Now, I want to get into this a, little bit, because you had some really interesting stuff to say about how this weird technology was first developed.

SMITH: The technology we were talking about earlier with a low-frequency ground penetrating ray are also can be used--it can actually be fit inside an iPhone. And you can place this on your hand or on your chest and it'll show you your hand and you can zoom in all the way to the actual cell and say, all right, I have three cells here next to him. This one's metastatic. I mean, this is a cancer cell. This is a tissue cell, and then zap it. And now you've just cured yourself of cancer. So it's that--the resolution on this device is that amazing. So you can actually just put it on your hand and then zoom right in to the cell itself and move around.

DAVID: That's great.

SMITH: It's beautiful. The most beautiful technology ever. And it's available. It's just sitting there. And I'm hoping that this talk will inspire the inventor and POTUS to step

up on that, because not only is it a great security thing for the world, but it's also a good thing for health. It's an amazing, beautiful thing to help--you could heal yourself.

DAVID: And I assume that this, whatever energy it uses is not radioactive or harmful?

SMITH: No, it's not--correct.

DAVID: Wow.

SMITH: Yes.

DAVID: Now, I think you had me on the phone with the inventor, at one point, and he just about screwed my head off explaining how this technology got developed in the first place, the essence of metals or materials in the periodic table, and how it sees that. Do you remember any of that stuff--what he said? Because I'm having trouble remembering--it was a very complex technical discussion.

SMITH: Yeah, I mean there's only, as far as I know, one, two, three people--including me--that know how the system operates and actually works. And I'm not at liberty to really talk about that out loud, for many reasons, also safety for everyone else on the planet. If it gets in the wrong hands, too, you have to be careful. So it's just like other amazing energy devices and stuff, and portals, and antigrav, and stuff. Everything comes with also a risk, and this inventor knows that very well. And this inventor was saved from another country, and is now a US citizen, and wants to help US first, and protect US, and protect him and his family. And he's--the poor guy has been through heck, of course. But like I said, the only thing I can tell you, is it uses a very, very low frequency--back-scattered wave, we call it--pattern. And it shoots back these algorithms. And then he's the only one that has the program. And only two other people, that I know--

DAVID: I remember you telling me something funny about how--like, the government has to come to him because he's the only guy that has it. So could you talk a little bit about how--what was his relationship with the government as the inventor of this technology?

SMITH: They're very upset that they will not--he will not sell this invention. Because he is waiting for the Cabal to be destroyed before giving it to POTUS, or giving it to the right hands. Because he is worried that we're still not stable yet. So he's very aware that we're still children and not--wouldn't be able to handle this. But he did use it for the Mexican tunnels and some other amazing clandestine projects to protect America. And there's a lot of things going on that people don't realize--inside information, like backpack nuclear bombs coming up through Mexico and things like that. And this product would immediately be able to pinpoint these things hundreds of

miles before they even get here. And so we could take precautionary methods that these nukes and things do not make it through our borders. And that's what the team and the military and POTUS are working on. And they're not allowed to talk about that, because they don't want to scare the American people. Why he's building a wall--or who is doing--why is the military out to sea at this area? And it's hard for them to bring this to the people, because if the enemy knows that you know, then they're going to change everything around. It's at a level now where it's just who you know and what the device is going to be used for. As you know, this scientist has no interest in billions of dollars. He's more worried about the safety of the United States citizens. And he wants to make sure when he does turn this over, that--and he has to be there every shooting--every--when we scan the ground, he has to be the one doing it, of course.

DAVID: All right. Well, there's so many questions here. So we'll have to pick this up again next time. Thank you, Emery. And thank you for watching. I'm David Wilcock. This is "Cosmic Disclosure," with our special guest, Emery Smith.

Subterranean Secrets of Humanity Season 10, Episode 9

Cosmic Disclosure; Subterranean Secrets of Humanity Season 10, Episode 9

DAVID WILCOCK: All right. Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock and I am here with Emery Smith continuing our fascinating discussion into underground civilizations. Emery, welcome back.

EMERY SMITH: Well, thanks, Dave. I can't wait to get into this one.

DAVID: So one of the things that I'm curious about, because there's a lot of light bulbs going off in my head right now, we have the crash site in Antarctica that we've already talked about before. You said there's a very massive--you confirmed independently, a very massive mothership there.

SMITH: Yes.

DAVID: That we've been studying for how long?

SMITH: As far as I know, through these scientists, 24 years.

DAVID: OK. And we have some kind of connection between that wreckage and the underground civilization that you described in Ecuador, which you said is actually started maybe as a craft. But then it got built out or something?

SMITH: Yeah. I think the energy of the craft must have stimulated--must have had also organisms on it or bacteria, because it changed the inside of the cavern into a different atmosphere, even. And the creatures that are down there and that plant life and stuff is completely different than the surface. And they have taken creatures out there, brought them to the surface. And they instantly died.

DAVID: Can you breathe the air without an apparatus?

SMITH: Yes. It's the cleanest air. I felt great down there, actually. And they've already tested it over and over and over. This is a new find, by the way, that I'm aware.

DAVID: Just to recap this Ecuador thing briefly. One of the pieces of intel we got from Pete Peterson--he talked at great length about how the ship in Antarctica had--that when you lived in the place in the ship, that you had your own yard. And there was like a filtration system of from the bathroom, from your shower, from the toilet that would go in and feed this garden. And so obviously, this was buried under the

ice. And so everything was destroyed. But now what you're telling me about Ecuador makes me wonder if maybe the vegetation in that ship in your own yard would have looked similar. What would your thoughts be on that?

SMITH: Yeah. I think there's a definite correlation between that and there. These are two completely different environments, of course, now. So I would expect different things to happen chemically. But that's still open for observation. I know they have a really good team down there. And they're not mistreating it and just chopping it all up and taking it all out. So we'll see what happens.

DAVID: Now, another thing that has all kinds of light bulbs popping off in my head is that the oldest of the Antarctica wreckage that I've heard about, from more than one source, is apparently 33-feet-tall giants.

SMITH: Oh, yes.

DAVID: Have you heard anything like that?

SMITH: Yes, I've heard about that.

DAVID: OK. What did you hear specifically?

SMITH: That there was a lot of other sarcophagis and a lot of other extraterrestrials, bodies down there that were over 30 feet tall that they have already found excavated. Some were removed. Some were not, of course. They're trying to build a story now behind everything and slowly release it to the public in a very calm way, because it goes against, of course, all the stuff that we've been brought up to believe as far as where we come from and religion. So they're going to just slowly seep these things out. One of the amazing things that we found at this other place that we were talking about earlier--

DAVID: In America?

SMITH: --in America, was a 33-foot being inside a sarcophagi in a state of status.

DAVID: Really?

SMITH: So this is kind of a pre-Adamite-type being we believe. And of course, the pyramids are nearby. That empty block cube rooms are nearby. The five acres of white powdered gold is nearby. And this is where the steps descend down into the hollowed out meteorite or whatever you want to call it, the hollowed out earth rock that is suspended mass around an aquifer.

DAVID: Right. So regarding stasis beings, we have heard from Corey, some of the

most recent briefings he got--and I believe Peterson had this too. That they found stasis beings that were 500,000 years old in the earliest Antarctica city of the--there's a very, very ancient one. It's over a billion years old, apparently. But then the recent one of 500,000 years ago had this exact same thing you just described. So that is amazing. Did you hear about similar stasis beings in Antarctica? I'm curious.

SMITH: No, I did not. No, I did not hear about any stasis beings that were in Antarctica. They did not talk about that. And there's many teams, just so you know. And this team was only a team of four scientists.

DAVID: Really?

SMITH: There's thousands of scientists on this project down there that work for different governments and our government and that are trying to cover up things and keep things also preserved. And as I said, I don't believe the craft actually crashed there either. I really think the craft actually was there and just stayed there. And whatever happened happened at that time, whether it was a cataclysmic event or whatnot.

DAVID: Right.

SMITH: And now the snow is melting, and Earth is going to be full disclosure.

DAVID: When we're looking at Antarctica being such a subject of interest, one of the insiders I spoke to said that there was a dark agenda, to some degree, for disclosing Antarctica. They felt that it would be able to create a religious war. Just speculating, why do you think that might be?

SMITH: Well everything down there is just going to destroy organized religion as we know it.

DAVID: Why do you think it would?

SMITH: Because they have found tablets and information and intelligence down there that's proving the history of Mars and the moon and the history of this area of the universe. I'll say this area of the universe. And they're starting to decipher it now. So that being brought up would cause, probably, a huge conflict. And that's what they're worried about is us misbehaving because of our religious beliefs.

DAVID: Right. So it doesn't necessarily mean that Jesus was fake or Moses was fake or Mohammad was fake.

SMITH: Oh, no. You're right. All these avatars have lived here and have been here and have been these amazing gods and people. What's going to happen is, if they did

bring up everything, it just--Let's just say the stories that are being told or not completely told to the full extent. There's gaps and things that are missing. And this will fill all those gaps. And it's like an unfinished book with all the religions. So this will fill in all those loose gaps. And everyone actually will come correct. But of course, I'm sure some will not. Some maybe won't believe it. To believe something your entire life and then have an archaeologist bring something up to the surface that says something different, it could cause some turmoil in the world.

DAVID: So you're saying that this massive boulder that was found somewhere in America at an undisclosed location has remains of giants in it.

SMITH: Yes, correct.

DAVID: And could you explain a little bit more. You mentioned armor. You mentioned skeletons.

SMITH: Yeah. A lot of skeletons and armor, lots of gold and silver, and the old medieval-type treasure stuff that you would find, lots of coins, lots of pots full of coins.

DAVID: But I thought I also heard you say that you felt like the entire interior of the egg was also stuffed with white gold.

SMITH: Yeah. There's about five acres that we determined of powdered white gold in there in a separate section.

DAVID: Oh. So it's not like the whole entire egg is filled with white gold?

SMITH: No. Just one small cavities.

DAVID: There are cavities that people could use to walk around in?

SMITH: Yes, yes, right. And these steps are fairly large steps. They're not just your normal steps, anywhere from eight to 13 feet.

DAVID: Wow.

SMITH: Coming up and down.

DAVID: So giants for sure, 33 feet. Eight feet for a 33-foot tall being.

SMITH: It would be just about right.

DAVID: Would be just about right. How clean are the steps? How do they look?

SMITH: Well, using the technology we have, they're flawless, kind of like how the pyramids and Machu Picchu was built. Everything is just such a perfect edge. And that's how we knew. It was like, no way could Earth have created this.

DAVID: And you're saying that, hypothetically, if you have a submarine and you know where to go, you could navigate into the Earth and swim right up to this boulder.

SMITH: That aquifer, unfortunately, has a small inlet in and a small inlet out. It's just this hollowed area that does hold a lot of water. So we didn't see any large areas that a submarine could fit into.

DAVID: Oh, OK.

SMITH: And that's why we just started from the surface of the Earth and just decided to drill on down, just drill straight down till we hit it, and then worry about it from there. But the problem was three feet of water with millions of pounds of pressure.

DAVID: Now, you were describing this very strange idea, which I remember you did have me talk to the scientist who invented this for a while, something about this light that gold emanates that seems to penetrate matter and can be detected by certain people who maybe are psychic. Is it like remote viewing?

SMITH: Well, no, it's not like remote viewing. They actually have different cones in their eyes and stuff that can see many different wavelengths of blue and gray light. So for some reason, they can look across the ocean and see a place that has a large amount of gold, unlike how our treasure hunters today, we don't have that capability. So we pay off people in the government and use satellites or borrow satellites from corporations to look through the ocean. But these treasures that are most amazing, unfortunately, are on land, below the land, in land. So it's a different type of treasure hunting now, as you can see. One of the funny things some of the treasure hunters that taught me that were very famous--I said, well, how do you guys always find the gold? Because not everyone has a chance to use a satellite. And they said, well, if we know of an area that someone says has gold, we'll go down there and scoop up all the seaweed. And then we'll take it home and feed it to all the rats. And we'll wait for the rats to poop, and then we'll see the gold. And then we'll go back and take the gold.

DAVID: Really?

SMITH: Yeah. So they'll measure the rat poop using, I think, a spectrometer or something, some sort of device. Isn't that crazy?

DAVID: That's stuff you couldn't make up. It's just too weird.

SMITH: So anyway, these famous people, these famous treasure hunters that are really great people that were in charge of this--amazing people, loving people, giving people, because they want to give. They don't want to keep this treasure. They want to give it back to the world and create things for the world.

DAVID: I want to go out on a limb here and ask you this. I kind of get the sense what you're saying is that maybe there's a certain strain of extraterrestrial DNA that's seeded into human population. And those people, whether they're aware of it or not, might have a slightly different optical apparatus, slightly different retinal tissue that, if they became aware of what they could do, they could learn that they would see this unusual efflorescence around where a gold deposit is. Is that true?

SMITH: It could be. Not only that, but also that somehow, they were downloaded from an extraterrestrial to increase their vision and have an upgrade. We call them upgrades. So there are certain people and very, highly special agents that work at the highest levels that have these special abilities that they use these special abilities for whatever--whoever they are working for. What's interesting is, inside that cavern is all some other things that we have found that shows the lineage from where everyone came from. Yeah. And that's one of the biggest gifts we could have. And it's hard for me to say that. That's the biggest secret that's down there is the secret to all of us and where we came from and the lineage of our DNA and what it contains and also instructions on how to read that DNA and instructions on how to build star gates and open up portals and things like that. So it's a plethora of not only religious artifacts and extraterrestrial artifacts, but it's also got a lot of amazing tools in there that we could use. And maybe we're just not ready for it yet to be opened.

DAVID: So how was this scientist--and I understand I might be treading into areas that are talking out of school, too classified for you to mention. But I just want to see how close we can get. Did this scientist, for example, have the ability to see these weird colors himself, or did he find somebody who could? Was the technology in some way based on the organic function?

SMITH: No. He was born this way.

DAVID: Really?

SMITH: So he was a gifted person who joined the military and was an amazing remote viewer and became right up at the highest echelon of people to go to when they need to find something, or someone. And he's very well respected amongst his peers.

DAVID: Could you explain, just because I'm sure people are going to be really curious about this--I know I am. If you had those special rods and cones in your eye, what would you see? Would it look like misty fog or exactly what?

SMITH: No. From what I've gathered, and this is second hand information, that they see just like we do. However, if they're looking, of course, for something, it's just off just like one small frequency of light. It just means maybe your shirt, I can see many blues in it, a couple of different blues because of the dyes. They didn't dye it correctly. Now, a normal person would just see a blue shirt. But I would see maybe a couple of strands of cotton there or Rayon that was a little different. So it's not throwing them off tremendously.

DAVID: So are you saying that the number of different unique colors that these people can see is more than average?

SMITH: Yes, absolutely.

DAVID: By how much?

SMITH: Well, I know they can see up to 10 different wavelengths of just one color. And I have heard of 20.

DAVID: Wow.

SMITH: So that's a lot to break down one color. And that's, like I told you, that was second-hand information.

DAVID: So you're saying that they can still somehow detect things that would be underground, like a gold vein underground?

SMITH: Because of the flora and the plants and the rocks all emanate from the gold reservoir down there. It seeps up and gives it special energy. And this energy is then emanated into the atmosphere, kind of like orgonite can control things in the sky, the energy that it gives off.

DAVID: Well, that's one of the things that's so interesting is this idea. Wilhelm Reich, when he was working with orgone energy, apparently started to develop a bluing of his skin. And he often associated orgone energy with a bluish light. In fact, I have multiple episodes on this in "Wisdom Teachings," my other show, where he's finding life spontaneously forming with what he calls bions. And the bions appear as these little blue corpuscles that seemingly come out of nothing and then coalesce into proteins and biological matter.

SMITH: Sure.

DAVID: So if that is the essence of life, then is there some connection between gold and biological life?

SMITH: Well, it's not just gold. Orbitally rearranged monoatomic elements is what you want to look at. You want to look at the elements that we're made up of when we we're brought into this world as a baby. We never get those elements ever again from our food or our water. These are palladium and rhodium and iridium and all these different types of elements that are the trace elements that we need in our DNA to evolve. So of course, there's many places that make ORMEs. You've got to be careful.

DAVID: Well, I remember hearing that rhodium, if you capped the DNA molecule with rhodium, it becomes far more electrically conductive than--

SMITH: Absolutely.

DAVID: Right.

DAVID: So I'm a big, strong believer in ORMEs. I take it pretty much every day, zeolite too. These things help with aligning the DNA for it to work correctly with the right voltage. If it's not the right voltage, we can't really fix ourselves. If it's not the right voltage, we can't evolve beyond where we're at now.

DAVID: Let me just point this out too, which is that the research I've done into what you're calling ORMEs, or orbitally rearranged monoatomic elements, is that they are actually what some scientists call microclusters, meaning that, if you allow atoms to come out of a nozzle one at a time, they will preferentially cluster into these beautiful geometric, sacred geometry patterns, three-dimensional patterns like a cube, octahedron, dodecahedron, icosahedron. And the molecules will actually form into that. And somehow, once it has that structure, it's much more electrically resistant on the outside conductive on the inside, much harder, much more resistant to temperature, to wear. It has all these amazing qualities. And it seems to nourish the body. So why do you think the sacred geometry connection is so important?

SMITH: Because that's what we are made up of. That is the smallest particles beyond the electron that we are made up that allows us to actually, in some point in time, transdimensionally travel.

DAVID: So you would confirm then, that part of the classified science is that when you get down to the real ground state of matter, that it is sacred geometry?

SMITH: Absolutely, yes.

DAVID: Right. Could you give me any further specifics of any briefing you might have had on that? What were you told exactly?

SMITH: Well, we were dealing a lot with magnetic energy and magnets and permanent magnets and trying to do a lot of things with magnets and change the flux

field, the north and south polarities. And then using special equipment, zoom in after we changed these different shapes of magnets, not your normal north-south cube magnet, and change these angles, and then zoom in there and see what is going on at that level of these two magnetic--permanent magnetic energies coming together with different flux fields at different angles. And at that level, which has not been completed, is these shapes.

DAVID: Geometries, wow.

SMITH: These sacred geometries. So they believe by changing flux fields, they can actually open up portals. They can open up different energy for our DNA. They can help us heal. A lot of different things can happen. But that's still in that state of it's not been proven.

DAVID: You said before something to the effect of that you feel perhaps higher-level extraterrestrials still have us under some kind of quarantine or management of some kind, that even if we got all this technology, it's not like we could necessarily just do whatever we want. Could you explain that a little more?

SMITH: Well, the extraterrestrials, they're not going to just come on down here and give us everything for free, because we have to evolve on our own consciousness and treat each other well and not cut each other's heads off and behave. And then everyone always ask me about the evil aliens. And I'm like, yeah, there's evil aliens. And there's good and bad aliens and all this. And they're like, what are the bad ones like? I said, just go in the bathroom and look in the mirror. Why is that? I said, because we're killing each other. We're not supposed to be killing each other. Even though that's a control thing. We're being controlled to do these things. So that being said, because of our misbehaving sometimes--and they were here before. They were like us. They evolved out of what we are now too. And they have come back from the past. Rendlesham Forest, they've come back from the past to visit and come out of that pyramid. And witnessed by over 100 people I think or 33 people.

DAVID: Yeah.

SMITH: And the message was, stop what you're doing with all these nukes, because were your children's children's children's children's children's children. And if you keep doing this, we're not going to exist, which is interesting, because that means there's no time. And now you're going to be like getting screwed around in your head, thinking about that. But basically, there is no time. And time is just something that we made up to survive here in the 3D. And there's many other different dimensions. And we're learning how to travel interdimensionally safely.

DAVID: What might some of the limitations be that certain ETs would impose on us right now that would restrict our total freedom? Like, what would be some of the

things that if we tried to do it that we wouldn't succeed or that we would be blocked?

SMITH: Yeah. I think if we try to destroy more than 75% of the population of the Earth, they will intervene. I think if we try to poison the earth permanently, let's say through Fukushima or our own accident, they will intervene. So I think it's things like this where, if it's going to be a complete, mass de-populization or we're really killing more than 75% of humans or animals on the planet, including the oceans, that there will be definite intervention. Of course, if any type of nuclear missile or backpack or whatever it is is activated that would destroy more than 75% of the population of the Earth, they will intervene. So not to say one would. But all it takes is one of those to go off and contaminate the atmosphere. And we're going to have a rough 50 years.

DAVID: Well, it also seems like there's a lot of other people living here besides us, maybe not the surface. But they're definitely here.

SMITH: That's right.

DAVID: And they don't want their land to be damaged either.

SMITH: That is correct, yes. So there's other extraterrestrial beings that live within the Earth. There's also ancient beings that have lived here forever, not extraterrestrial, but they've just been here, probably since the dawn of time, the Inner Earth beings. And that's something we could talk about on a different show.

DAVID: Sure. Now, when you mentioned these traversable aquifers under the oceans or under the continents, one of the things I was reminded of was a briefing that Corey got, something he actually saw, which was these massive halls, kind of flat on the bottom, rounded off at the top very, very large, underwater that you could actually sail a submarine through. And they were very straight and went over very long distances. And that apparently, some of our guys used one of those to get to Antarctica from further up north. I'm wondering if you've heard about buildouts and tunnels?

SMITH: Yes. They're man-made though. They weren't made by the Earth.

DAVID: Well, they are ancient though. They're not made by our humans, right?

SMITH: Right. That's what I'm saying.

DAVID: OK.

SMITH: Yeah.

DAVID: Yeah. Yeah. That's what he meant, yeah.

SMITH: There's caverns that they found in North America and Mexico that go straight through the Earth towards Antarctica. And those caverns have been modified, I don't know by who or when. But they've been modified into lava tubes, like perfect, large, football field-size tubes that these submarines and other modes of transportation, very high-speed by the way, in these waterways. It's its own traffic. That does go not only to Antarctica but all the way back around.

DAVID: Back around to where?

SMITH: To the same spot.

DAVID: To the Americas?

SMITH: Yeah.

DAVID: Oh.

SMITH: Without getting near the core.

DAVID: Do they have any idea when they were built or by who?

SMITH: I don't know the history of it. I just know they exist, through satellite imagery and through radar and through briefings.

DAVID: And these tunnels that are the larger ones that go to Antarctica, are they all submerged in water, or are some of them just voids that are in the land that have air?

SMITH: They are small parts of tunnels that go to cavern to cavern to cavern. But they all are connected to a cavern, and they all are full of water.

DAVID: Oh.

SMITH: Yep.

DAVID: And the caverns are full of water too?

SMITH: Yes.

DAVID: Really?

SMITH: Yes. It's a giant aquifer, like I was telling you that's connected. And I think, because of these tunnels, that there's been infiltration to all the aquifers of the planet.

DAVID: One of the briefings I got from Pete Peterson recently was that some elements of the Alliance are worried about the habitability of the surface of the Earth,

and that they've started pumping out some of these very large caverns underground to be able to have more space for people when they will need it, and that one of the side effects has been that all these weird creatures that shouldn't exist are washing up on the shoreline. And I'm wondering if you've heard anything about that particular plan or that operation?

SMITH: I do know about the build-out of caverns, 100%. That's true. And the pumping out of these caverns and sealing them off, that's true. As far as the beings coming up from Inner Earth or something like that, I don't doubt it, because there are inner atmospheres in the Earth with their own lifeforms that have never been discovered or told to the population. So it's very possible that, in a cavern that has its own spring, that one of these things came up from its own world and then made it to the surface. And not only that, every day, they're discovering in the oceans a new form of plankton and bacteria and things like that. Every day, they're making discoveries. And every day, we're also having a loss of life, of different species. So it's interesting that right now, especially the things that are coming down from space. We have these giant satellites in space that just collect. It's like a giant air filter. And they send these things up. And they come back down. Or they'll send the weather balloons up, and they get all filled. And they have these amazing new bacteria that's never published.

DAVID: Very cool.

SMITH: That is from space. And just like we were talking about that water bear guy--what's that guy called?

DAVID: Tardigrades.

SMITH: Tardigrades. They live in the vacuum of space. And they come back and they're fine. These are amazing things too.

DAVID: Still alive.

SMITH: And I was part of some of those projects too where they're trying to find out how we could be like that.

DAVID: Right. Well, even though you said there's no time, we are out of time this episode.

SMITH: Oh, OK.

DAVID: So come back next time.

SMITH: All right. Well, thanks for having me.

DAVID: Thank you. And thank you for watching. This is "Cosmic Disclosure." I'm your host, David Wilcock, here with Emery Smith.

New Discoveries of Ancient Builder Race Season 10, Episode 10

Cosmic Disclosure; New Discoveries of the Ancient Builder Race Season 10, Episode 10

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. I am here with Corey Goode for his fascinating cosmic updates, and in this episode, we're going to cover the return of the Ancient Builder Race. Corey, welcome back.

COREY GOODE: Thank you.

DAVID: So we are in the middle of a very important scene here with a cliffhanger. You were told you were going to get a tour of the LOC, and you mentioned for the first time on the show that there are actually three of them. So could you tell us a little bit more about what was that tour going to be, and why is it relevant?

GOODE: I was told that I was going to be able to tour some ancient facilities that the three LOCs were built around.

DAVID: Oh really?

GOODE: Right. Immediately after the briefing had concluded, we were escorted directly to that tour, but the briefing wasn't over. What occurred was the window that was against the wall that had the moonscape scene, one of the large smart glass pad screens lowered from the ceiling. Sigmund stood up, and he said, I've got a treat for the both of you. He stood next to the screen, and then pivoted back towards us at the table. He said, for some time, we have been observing what appears to be a derelict craft that's been coming towards our solar system, and it's, you know, one of the many things out there that we're monitoring.

DAVID: Did you have a sense as to what he meant by for some time? Are we talking many years?

GOODE: That's all I got. So I know they've probably been tracking it for many years.

DAVID: OK.

GOODE: He said, we were observing it with key interest, because it was getting closer and closer to the outer barrier. The region where the outer barrier is, they were kind of interested to see what would happen when the craft interacted with the barrier, like what type, you know, they could gather intel.

DAVID: Did they have any intel on like if a spacecraft had tried to escape our solar system and hit the barrier, does it explode? What actually happens if something strikes the barrier?

GOODE: It seemed to be kind of like a plastic or something that held them back. They would try to go, and it would hold them back.

DAVID: So it didn't necessarily destroy them, but it just would stretch?

GOODE: Right.

DAVID: OK.

GOODE: Right.

DAVID: So how much information were they able to gather about this craft? Were they observing it up close? Were they landing on it?

GOODE: Well, they were gathering telemetry for a while, and they were watching it approach the barrier.

DAVID: Oh right, so because they couldn't leave the barrier--

GOODE: Right.

DAVID: --they couldn't go out and look at it. They could just watch it with instruments.

GOODE: Right.

DAVID: OK.

GOODE: So the moment that it was going to strike the barrier region, they had all of their instruments pointed in that direction. To their shock, this derelict craft came through the barrier.

DAVID: Really?

GOODE: Well, yeah, but what they didn't know--so the barrier had already been dissolved or taken down.

DAVID: Right, which you had said in a previous update.

GOODE: Right. An announcement didn't go out. I mean, no one knew.

DAVID: Right.

GOODE: So a lot of the beings weren't coming here or leaving, because they thought the barrier was still erected.

DAVID: But you had mentioned that this Galactic Federation was now enforcing it.

GOODE: Right.

DAVID: Would that end up being basically the same thing in terms of how it works?

GOODE: Basically in how it works, except with a military blockade, they're probably going to stop you with extreme prejudice.

DAVID: Right. OK. So once they found out that the outer barrier wasn't working, that this craft glided through it, what did they do next?

GOODE: Well, Sigmund, as he was standing up giving the presentation, he sort of puffed up, and he said, I led an expedition to this craft to see who owned it, where it came from. As he said that, telemetry started popping up on the screen. It was obviously a video, and then all of these numbers and coordinates started popping up real fast, and then they went away. Then I saw a long narrow point of light, like in black space something reflecting light, and it was slowly tumbling, very slowly tumbling. I started hearing beeping and communications, sort of like a NASA transmission, and they were talking about matching the spin of the craft. Then they were calling out how close they were, you know, and touch down or land with the object, and they did three, two, one, mark. It was just like a NASA transmission. The shuttle that was approaching this craft, out of, I guess, the sight of the craft or the bottom, it shot out a drone. This drone was taking a video of the shuttle craft getting closer and closer. It was a long cigar shaped stone craft. It was made of stone.

DAVID: OK.

GOODE: About a third of the way down was what looked like a metallic, very crystalline metallic material, that was obviously where the bridge had been of this craft. This stone craft looked like it had gone through just millions of years of collisions of other space objects. It was really beat up. On the outside there was looked like dirty ice going from the point of the dome, and the dome had all these holes in it, it was all cracked and smashed up, but out of it going along the side of the craft and around was ice. It looked greenish brown like lake water with here and there pink or orange little smears in it. I obviously didn't know what that was at this point. Once they landed and secured their landing with this craft, they began to exit in spacesuits.

DAVID: How did they get in?

GOODE: Well, they got in through one of the holes. They dropped-

DAVID: In that bubble that you mentioned?

GOODE: Yeah, in the bubble. They had lights on their helmets and on different parts of their suits and at the end of each of their wrists there was a light shooting out.

DAVID: Was there any gravity that allowed them to walk, or how were they able to maneuver into the craft?

GOODE: There was no gravity. They pulled their selves through just like you see astronauts on the space station. You know?

DAVID: OK.

GOODE: They were wearing GoPro type cameras, and it cut to video feed of, at that time, one of the cameras on one of the suits. As they went in, the lights that they had were very bright. You could see fairly well in their general vicinity. It was obvious that there was no gravity in the craft either, and in the bottom of the craft where the floor would be there was a thick ice coating that was just like what was on the outside of the craft. It looked like frothy lake water with organic material in it. Immediately there was a guy picking at the top of it with a little pick ax looking thing, and then he took a core under that. It was only like that deep. They're putting them in these plastic vials and bags, taking samples, taking photos, and video.

DAVID: Was there any consensus as to what that might actually be?

GOODE: Sigmund said that later on, after they tested everything, that it was full of organics, and that it was most likely remains of the crew.

DAVID: Really?

GOODE: Of the original crew. So in the video, I see all of these different panels that were pulled off of walls that were just floating around, and there were areas that obviously technology used to be, but it had been picked bone dry. They said it was obvious that over millions of years that the craft had been boarded many times by different extraterrestrials, and that they had picked it clean. So they were documenting where all this technology had been removed. There were different signs around from different ETs that had been there. On the video of one of the astronauts, you then hear over the radio, I found something. You guys need to come and see this. Then, all of a sudden, you see the astronaut is traveling through different floors, going through different floors on the craft, on this ancient craft, and you'd see him pulling through

holes and looking for openings to go into the direction, because the person called out, I'm on this deck aft starboard side, you know. They were making their way there. When they got to the area where you could see light coming in from a doorway where a panel was jammed sideways in the door, and you couldn't see that there was a doorway there normally, but this astronaut found it, and he was inside. Then the man with the camera goes inside. There is a room with a bunch of looked like drawers like a morgue. It went up pretty high. The room was fairly large, and the drawers were curved like that.

DAVID: Did this frothy ice exist on all of the surfaces, or just the floor?

GOODE: It was just on the floor, which, as I told you, there was no gravity. So they stated that, at the time, it had been close to a star. They said that this craft was around a star not too far away. They named the star, and that it was stuck in an orbit around the star for millions and millions of years. The temporal data that they were able to use to date this object was one billion plus years old.

DAVID: Wow. Just so that we're clear, this is not carbon 14 dating. This is some other technology that we don't usually have.

GOODE: Right. Yeah. It's a completely different technology.

DAVID: OK.

GOODE: But they start pulling open drawers, and some of them are empty, and then some of them were not. They opened a drawer, and on it was laying a being that looked like a pterodactyl. It was very light pale blue, and it looked like it was probably darker blue before, pre-mortem, before it died, and it just faded. In another drawer that they opened was this pinkish orange looking being. The torso was very thin, and it looked pliable, and then it went off into two legs that looked like basically tentacles.

DAVID: Like from an octopus?

GOODE: Like from an octopus. Also, it had water jets on it. It was obviously an aquatic being. At first when I saw it, I thought it was some sort of mammalian.

DAVID: Are these bodies just sitting on a gurney, or are they inside a tube or something?

GOODE: No. They're laying on a table. They're stuck to the table. They didn't start floating up. They were stuck to it. The long aquatic being had, interestingly enough, three toes and three fingers that had suction cups on them.

DAVID: Which is very much like the Golden Triangle being.

GOODE: Right.

DAVID: Yeah.

GOODE: They pulled in bags. They were going to start bagging the bodies. When they started pulling at the bodies, they just started disintegrating. They were freeze dried from being in space for so long. They started, you know, putting the pieces in the bags. The whole room filled up with a dust and particles of the body. One of the guys was using some piece of a panel, it's like a spatula, to scrape to get the body, because it was just bonded to the table.

DAVID: I mean, that seems a little odd, because if you look at the protocol now for if we find a new tomb in Egypt or something, everybody has to be so careful not to damage anything. If this is such a valuable object, why would they be so careless in the way that they're trying to get these samples?

GOODE: Well, this is the SSP Alliance. This was a quick operation where they had to get in, gather intel, and then leave.

DAVID: So it's not like with probably with all the artifacts that they've found over the years, they don't have time to treat this with a great deal of staff and a great deal of attention.

GOODE: Yeah. They really didn't have time to set up like an archaeological dig site properly. If they would have been larger a larger space program, one of the ones that's in control of that region of space, they would have set up, and they may have already taken possession of the craft, and then set up a forensics team.

DAVID: So these bodies just crumble apart, and they're putting them into bags?

GOODE: Yes. At this point, we end up cutting to a different camera of another team, because someone else was calling out that they found something. They went to this one particular floor that was larger than the others, and everywhere on all the walls were two different types of writing. Now, if you hadn't guessed by now this technology is Ancient Builder Race technology.

DAVID: Wow.

GOODE: So the crew was very excited.

DAVID: So could you please review for us what is the Ancient Builder Race technology throughout our local star system, and why is a written inscription so

important?

GOODE: Well, in our local star cluster of 52 stars or so, this one ancient race left technology and artifacts everywhere, but no where were they able to find any type of writing or glyphs. Other ETs had gone in years later, cleaned off any writing and glyphs, and basically claimed that this is our technology. You know, we built this technology.

DAVID: You had said that a lot of these artifacts were pyramids, obelisks, that kind of stuff.

GOODE: Yeah. Yeah, definitely a number of them are different types of structures like that.

DAVID: Interesting. So, wow, finding writing, whoever tried to sanitize all this, that opens up a huge new avenue of archaeological exploration.

GOODE: Well, not only that. Apparently, one of the languages, they were able to translate fairly quickly. I saw a video of the walls, the ceilings, the floors, there was writing everywhere, two different types. One type that they had not fully figured out, they said was a type of a language and a hyperdimensional mathematics mixed together. There was some wispy stylized type of glyphs. The others were dots, long dashes, short dashes. It was kind of like Morse code, but it was very complex. They learned the order to read it in. They said it was very similar to a glyph type of root language that they found on several planets in our local 52 star clusters.

DAVID: Wow.

GOODE: It was close enough to where they could decipher. The other language they were unable to decipher.

DAVID: Are there any traces of that root language on Earth?

GOODE: They said that they had found elements of that writing in different forms.

DAVID: So did you ask at some point whether this was Ancient Builder Race, or if they had determined that?

GOODE: Well, actually I didn't have to ask. Sigmund stated, you know, this was Ancient Builder Race technology, and now we finally have some of their writing. They were more excited about that than the prospect of finding any type of genetic or technical materials.

DAVID: Wow. If this writing appears in all these different ancient star systems, then

would that suggest that this group was visiting them and was seeding written language and mathematics and civilization on these different inhabited worlds?

GOODE: Well, at one time, I guess you could call it an empire, all of those stars were part of a giant empire, or group, and these were the remnants of that empire that disappeared. Now, what's interesting is that when they were looking around at these different floors and gathering information, later on they determined that a couple of the floors had been pressurized with water not air. So the craft was a joint craft between an aquatic species and a non aquatic species.

DAVID: Wow.

GOODE: Apparently whatever occurred to this vessel caused it to depressurize, a catastrophic depressurization, and that basically destroyed the beings that were on the inside. It homogenized them, and made them a part of this goo, this muck that froze to the ship.

DAVID: So I believe it was around December 10th or 11th of 2017 that the mainstream media announced this cigar shaped asteroid that NASA has just discovered that they called Oumuamua. It sounds a lot like what you're describing. Is that the same object?

GOODE: It is.

DAVID: OK. So that's really interesting, because it happens just a few days before the sanctioned Tom DeLonge disclosure took place.

GOODE: And right after the Blue Avians faded out of our density.

DAVID: Right. So do you think there are plans for this craft to be revealed to us at some point in terms of them showing this footage that you saw, or going there again?

GOODE: Maybe. Maybe. You know, I don't know. I don't think they were planning on sharing that much information for a while. I think it was more of a great opportunity to gather intel more than anything.

DAVID: The NASA report said that it passed out of our solar system, and that it had a red metallic kind of color to it. So they really do seem to be trying to help disclosure along by making this announcement. What are your feelings about the implications of this craft for humanity?

GOODE: Well, depending on what is deciphered language wise inside that craft, we're going to have a lot more information about this Ancient Builder Race. Even some of the most ancient ETs that we deal with out there, they're just as much in the

dark as we are.

DAVID: Right. So what happens after you go through this briefing about the craft and you see the video?

GOODE: The video ends. He asks if we have questions. We ask some questions, and then get a little bit further information that has to remain classified, unfortunately. Then it was announced, are you guys ready for your tour of the LOC. We ended the meeting. Gonzales and I walked outside. The female Air Force officer was out there, and Sigmund came, and a few of the other SSP Alliance representatives came with us. On the floor there was this one elevator that you saw, and the rest were just a bunch of closed doors. We went to that elevator, which was a different elevator than the one we came down on. Then we got on the elevator, and we started heading downward.

DAVID: So what happened when you ended this elevator ride? Where do you end up next?

GOODE: We exit into a room that you walk through, and then you go down some stairs, and out to an open area. When we were in this little room that we first walked out of, there was glass, and I could see the lava tube cavern under the LOC. We get in a shuttle type of craft, we take off, and we begin flying through the tube, this giant lava tube. As we were flying, below, I saw what looked like old giant tractors that were broken and were set to the side, like it was a piece of equipment that broke. It was too big to move, so they just pushed it aside, and went on with their business. It was very old, and it had tracks on it like a tractor. They had big almost like blades coming out, like you had the tractor the tracks. Out of the tracks came these long almost extensions that looked almost like toothpicks, but fat. That helped give them more grip as they were going. There was track marks behind it. You'd see track marks with a line, track marks with a line, and they were staggered. There were a few different types of tractors down there that looked like they were obviously old and broken. Then we see human made structures on the bottom of the cavern. There's another large hole, and there were bases that were like cylinders, but like half cylinder, split radiating out from this hole. We went down, docked, and they have us go into LOC Bravo. LOC Bravo is a much smaller facility. Walking around, we actually saw people with NASA emblems on one piece suits and even a blazer, one guy was wearing, which was interesting. I'd never seen anything NASA related to that point.

DAVID: Yeah.

GOODE: A small group of people start walking towards us very excitedly. They were PhD types, scientists. They started telling us we're going to go on a five hour excursion. We need you to be in these environmental suits. We're going to train you

real quick on using the environmental suits, on the security backup procedures, and once we get all suited up, we will head down. So we all got suited up in these environmental suits. They weren't pressurized. They were just environmental suits. Then we reembarked on to the shuttle craft, and it flew us down into the hole. When we flew down into the hole, I saw many, many more ancient machines that were obviously broken and shattered. When the scientist, he began to talk to us as we were heading into this tour. He said, the moon itself it has been struck many, many times, obviously, by asteroids and other things. He showed a crater on a device, a crater that was struck by a meteor, and underneath, it fractured the whole area. It hit, and then it bounced off, and then it fractured an area, and then pulls it open. So it's like, you know, there's density here, meteor hits, and the moon pushes back. So it bounces back, and it pushes in the moon crust material. Then it expands back out. All the energy transferred to the rock, so it melts. After it spreads apart and melts, it begins to form lava channels, because of something to do with the way the moon is spinning. I didn't understand it all. It's created these huge lava type caverns, but also these huge rift areas to where the smashing occurred, and then it pulled back away, these huge kind of ripped areas where the rock had been pulled apart. Those had been exploited long ago by several different races. Now, sadly, I can't get into very many details about this five hour tour yet, but I'm told I will be able to give all the information very soon. I can tell you, it was an amazing tour.

DAVID: Corey, could you tell us anything at all specific about what you saw? You mentioned machines that look shattered. Were they crystalline machines?

GOODE: Yeah, and most of everything that we were shown was destroyed. Some sort of huge concussion wave had occurred thousands of years ago that destroyed just about everything in the moon. I did see some bodies, ancient bodies, and I did see a bunch of things on the ground like these I-beams that were shattered and broken that looked like they were extremely strong, but were made out of that same crystalline type metallic material.

DAVID: Oh, like what these pyramids and domes and stuff are made from?

GOODE: Right.

DAVID: Wow. So you think these machines were actually making the beams out of the lunar material?

GOODE: They were obviously ground works devices. They were helping connect a lot of these caverns and rift systems, and they were building them out. There were signs of concrete that they were using as well that they were making out of the regolith. Now, at one point, when we're standing and looking at all of this, I look over at Gonzales, and I said, I've never seen anything like this. Have you? He was quiet.

He was just looking. Then Sigmund said, actually, you've been here before. I looked at Sigmund, and I said, what do you mean? Then it was explained to me that during one of my previous 20 and backs, one that I don't have full recall of, I was a part of an expeditionary team. I'd apparently been all through that complex prior.

DAVID: Well, it does seem interesting to think about as we explored the new world, we found the Mesoamerican pyramids. The feeling of awe of people who saw that for the first time when it had never before been seen by Europeans seems similar to what you're describing here. Then after a while, everybody takes it for granted. Oh, yeah, the pyramids. Do you think that will eventually happen with this, too?

GOODE: Well, it seemed it had already occurred with the eggheads that were there working on it. You know?

DAVID: Right.

GOODE: It's amazing what can become normal.

DAVID: Did you hear about this ever potentially becoming known to humanity as a whole?

GOODE: As a matter of fact, one of the PhD types was standing there, and so was Sigmund, and they basically pronounced that one day we will be giving this same tour to a major television network.

DAVID: Wow. Did they have any sense of how soon that would be?

GOODE: No.

DAVID: Well, you had mentioned in a previous update that this time period of 2023 to 2024 appears to be one in which a lot more of the full disclosure scenario will happen. So do you think it's possible that this would be one of the things we would see during that window?

GOODE: It's possible, but I think that is something that--You know, like I said, the powers that be were planning on revealing an ancient civilization discovered in Antarctica and at the bottom of the ocean, and then claim that they're part of this bloodline of this ancient culture. Then they were going to say, oh, by the way, we have a secret space program, and we've traveled to all these different planets and the moon, and we found these same artifacts there. So it could be a part of that revelation.

DAVID: Right.

GOODE: These were university egghead types that were working at the LOC.

DAVID: So what happens at this point? How does this story progress from here? You're told there's a lot of things you can't say. You can't give us very many descriptions of what you saw. I guess, you can't tell us what the bodies looked like.

GOODE: Mm-mm.

DAVID: OK. Could you tell us if they were giants or regular size, or is even that not allowed?

GOODE: All I can say is that they were larger than us.

DAVID: OK. That makes sense. What happens to you next?

GOODE: Well, we're brought back to the LOC Bravo. Like I said, we also visited LOC Charlie. I can't talk about any of that. We came back.

DAVID: But you had implied that these LOCs were built around architectural sites?

GOODE: Right.

DAVID: OK.

GOODE: It ended with us coming back, taking off the environmental suits. We were just soaking wet with sweat. We were allowed to take showers, and then put on the clothes that we wore when we arrived. Then, you know, we were again the secrecy thing was talked about. It always is. They had us both, Gonzales and I both, sign a non-disclosure.

DAVID: Really?

GOODE: Yeah. We had a small debriefing, and then we were, basically, brought back up to LOC Alpha, I guess, we can call it now. I was brought back up to the same catwalk area where the dart had landed, and I went home.

DAVID: So what do you think will happen to us as a society if we get to that point where that live television broadcast occurs? How will that be for us?

GOODE: I think at that point, we will already have had quite a bit of disclosure, but this is going to expand our consciousness in a major way as a society. We're going to go from thinking we're these little knuckle draggers on this one little planet to realizing that we're a part of a living, breathing cosmos, and that we have cosmic cousins all around us that, once we get our stuff together as a society, that we're going to be able to interact with and trade with and learn from.

DAVID: Yeah.

GOODE: So it's going to be a very exciting time.

DAVID: Well, this is a very exciting future that we have in store for us, and I really do hope that we get to see this. I want to thank you for watching. This is "Cosmic Disclosure." I'm your host, David Wilcock, here with Corey Goode.

Programming Human-Alien Hybrids Season 10, Episode 11

Cosmic Disclosure; Programming Human-Alien Hybrids Season 10, Episode 11

DAVID WILCOCK: All right. Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. I'm here again with our special guest, Emery Smith. In this episode we're going to be getting into extraterrestrial and human hybridization and some of the very bizarre research that he was involved in on that subject. Emery, welcome back.

EMERY SMITH: Thanks, Dave. Thanks for having me.

DAVID: When you have told us about the work that you did with the autopsies of extraterrestrial bodies, it's a very curious subject for me, because obviously these bodies are coming from somewhere.

SMITH: Right.

DAVID: But the scope of how many you yourself autopsied--you say, including all the tissue samples and everything, 3,000 roughly.

SMITH: Yeah. Specimens--tissue samples and beings, yeah.

DAVID: The sheer genetic diversity of all that material. And then the idea of if lightspeed is a barrier for travel, how could there be so many extraterrestrials that we would even be able to get our hands on? Or is lightspeed not a barrier to your understanding?

SMITH: Oh, light speed definitely is not a barrier for extraterrestrials. And that's a great point to correlate with the amount of numbers of tissue specimen autopsies I've done. And the number of operating rooms that are down there that are running 24/7.

DAVID: Right.

SMITH: And the number of living habitable worlds just in our own solar system.

DAVID: Right

SMITH: So the numbers are not a lot. We look at it like it's a lot of numbers. But as you pointed out with everything else that's going on in the universe, and all the different habitable worlds that's been proven, if you really think about it, it's not a big number for just one little planet to have all these different specimens. And what's not

to say all these specimens came from outer space? Maybe they came from inside the Earth in different places. Maybe they did open up some cavities and found different living things. Maybe some things have been coming through portals as well that we're unaware of that they've been collecting, which is a whole other subject. But what's going on is basically we do know one thing--they have specimens. And they're taking this DNA, and they're mixing it with human DNA, and trying to make the human a little bit more powerful, a little bit more stronger, and trying to also incorporate that to a super-soldier program to have stronger bones, you know, have a faster thought process, and these things.

DAVID: Again, it was very surprising to me when we were talking about you seeing a reptilian type of being apparently in custody of two people. You said it was 10 feet tall. But for you at that point in time, it could just as easily--or maybe more easily--have been something that we grew or we made. You weren't necessarily convinced you were seeing an extraterrestrial. What led to you having that level of confidence that such a thing could have even been accomplished?

SMITH: Well, number one, just seeing something like that, it's hard for me to believe too much that I see when it's like that brought out in the open. And it's usually sometimes done intentionally and sometimes not. But after working on the cell collection job, I also later on went into the super-soldier program where they were mixing hybrid DNA with human DNA--in Petri dishes of course, really small level stuff--and also the osseointegration program of mixing tissue into titanium, and allowing tissue to grow inside titanium, and making our bones stronger.

DAVID: How does that work? That seems to be pretty far out stuff. Titanium you wouldn't think is going to be able to blend with living tissue, per se.

SMITH: That's what we all thought. But with the advent of new materials out there and the nanoparticles of the surface of the titanium, they have now mastered it and mimicked bone marrow. You know bone marrow, when you cut into your steak and you have that mushy, spongy type?

DAVID: Sure.

SMITH: Well, they have mimicked that exactly into titanium. Then they put stem cells, and growth factors, and tissue--bone cells in there. And it grows and just flourishes inside titanium.

DAVID: Really?

SMITH: And the body accepts it as a natural--it doesn't resist titanium. So steel and titanium is used in surgery all the time. So they learned this is going to be a great way to reinforce anyone's bones, number one, and to allow them to withstand a lot more

pressure. They were having problems, of course, with the muscles and tendons. Muscles they can grow to infinite. The tendons were the problem, because the tenocytes are the hardest thing to grow. And it couldn't support the weight of the extra metal, and the bone, and the strong muscle. So then they started looking into hybridization of DNA with stronger tenocytes from other living creatures.

DAVID: Well, you whizzed through a lot of stuff really fast there. So let's try to break this down into chunks. First of all, yes, I've heard about people having titanium rod in their leg, titanium bolts holding their bones together, that kind of thing. But are we talking about something that can be introduced into a healthy living adult or are we talking about something that has to be manufactured in conjunction with biological tissue as it grows--so a--

SMITH: Correct.

DAVID: --designer being?

SMITH: That's correct. It used to be let's just reinforce this person, see what happens, which is a very--it's surgical. It's a very brutal type thing. But now with the advent of 3D printing, organs and tissues, all's I need is a piece of your DNA and I can 3D-print you over nine months and have you, your body and your everything. Even you will recoup a lot of your memory because it's stored in the DNA. So what I'm getting at is what if I put the titanium already into the vat and 3D-printed you over the titanium with all the articulate cartilage and metaprogram? And I could program, like you said, the kind of soldier I want.

DAVID: So you're growing it life adult size from the beginning?

SMITH: Correct.

DAVID: Well, normally a human is going to take 13, 14 years to reach adult height, maybe even longer.

SMITH: Right.

DAVID: So how would they accelerate the gestation growth process?

SMITH: Yeah, they do that. Nine to 24 months they can make a complete body. And they do that with the advancement of neurotransmitter chemicals, and hormones, and special amino acids from un-Earth origin that allows the body to regenerate faster and the cells. The problem they're having is with the brain; it doesn't grow as fast as everything else. So that's the problem with when we take a pig heart. The reason we use pig valves in open-heart surgery--

DAVID: Sure.

SMITH: --is because they grow around the exact same time cells. Now if I took a dog heart and put it in you, it would grow so fast that you would die, because their cells replicate even faster. So what they are trying to do is let's find all the species on the planet, and let's find out who replicates the fastest, and let's make it more of that species than human. And that way that will be the dominant gene, you know, in that being. But it will have all those attributes of great eyesight. So they were splicing hundreds of different genes together, which is very difficult to do. And they use very mega supercomputers to do this because of all the algorithms that are done. And they did it from scratch. And then they keep adding extraterrestrial DNA to it with the extraterrestrial DNA that they have found that is comparable to human DNA as far as the growth rates. And that's why I mentioned the pigs--believe it or not are the closest thing to us. They have the same growth rate. So once you get all the same growth rate on board, then you're allowed to add certain things to them and growing conditions to accelerate the hybridization and the growth, and at different times adding different chemicals to that being so the brain keeps up with it, because the brain is the problem.

DAVID: So you're saying that the bone marrow of an entire skeleton would be created almost like a chassis or framework and then grown? Or is it more that--

SMITH: Yeah, you can grow the bone over the titanium and just reinforce it. So the titanium is already there. And then you have these 3D printers that are printing the tissue into and onto the metal or other substances. There's other substances they use besides--I'm just using titanium as a basis because everyone understands titanium and osseointegration in the science world. But there are other substances they're using besides that now that are more flexible and that are more durable to keep the person, or the soldier, or the program life form, or the clone to last longer in battle or to last longer on mission-oriented missions.

DAVID: So if you print up a being into full adulthood in such a short time--you say as little as nine months--does that also lower its overall lifespan because it hasn't grown at the slow rate that a human normally would?

SMITH: I was not in the project long enough to know about that. But from what I heard, that is true because of the mutations that happen when you grow cells. If I take your cell--like a stem cell--and I grow a bunch of them, some of them are going to be a little whacked-off. And that could turn into a mutation. And then when they found out this happens, they embraced it, because they were now making new species, because they wanted it to mutate. And then it got really weird. So then you were having all these different species in one mutating and forming new crazy monsters. All sorts of weird designs were being made, mixing extraterrestrial DNA with human DNA, with the DNA from different types of bacteria in the ocean, and this, and that,

and the other. And it just got out-of-hand. And you'd see vats and vats of these beings in stasis that they failed, like the one I told you about--the tiger, the person tiger.

DAVID: Part human, part tiger--

SMITH: Looked like a--

DAVID: --hybrid.

SMITH: --hybrid, yeah, that was mutated, unfortunately.

DAVID: Is it possible that if you have a being that didn't work out properly and it's kept in stasis--can that genetic material be reused?

SMITH: Yes.

DAVID: OK. I figured, but it's--

SMITH: Excellent question.

DAVID: --a little dark. But let's talk about that.

SMITH: Well, you're talking about the actual genetic or the cellular material of that being--

DAVID: Right.

SMITH: --in stasis. Yes, they can do two things. They can terminate the being and liquefy it and then use that amino acids to do other things. They can also extract the DNA from that and save it and come back to that later if they need a missing something. And basically adding and subtracting things from the DNA is what they're doing to find out what is going to be able to work together. Because the problem is everything wants to fight everything. Just like when we put someone else's heart in someone else's body, there's a rejection--

DAVID: Right.

SMITH: --rate So what they have perfected is getting rid of all that, getting rid of the antigens and antibodies that are saying no. They are now able to program the cells to accept it, even though the body might not last a year. But at least they will have a body to do whatever job.

DAVID: So the lifespan, the fact that it's so compromised, what does that mean for trying to use clones to build a species? It's almost like this is messing around with something that doesn't really have the potential to create any lasting life form. It's

more like just a tinkering.

SMITH: It is a tinkering. And tinkering gets my lab money. So when I make a breakthrough, I'm going to get what I need for my lab for the next year so I can do even more tinkering. But once you get to a spot--which they already have. So they're already making clones. That's not a secret. They're already making clones and they're storing them in the thousands. And they are able to keep these clones alive until they activate them. And we call these programmed life form clones. Not just a regular clone that they make and they use for their own personal whatever--assistant. These are clones that are actually going to be used for something. And I can speculate only the worst. Because I wouldn't want a whole world full of clones that who knows what's going to happen if they mutate down the road or how long their lifespan might be. So they're probably going to be used for war, because they're just an asset that can be destroyed. That's the only thing I can think of, because I don't know why they would store so many clones in one area and then this information leak out into the private mil labs. It could be disinformation, but it's not--it's actual real information. And now it's coming out to the public. China is already saying they'll be growing people for their organs. It's on national news. So what's going to happen when they're 18? You just kill them and take the organ? What's going to happen here? You're just growing these people.

DAVID: That's pretty bizarre.

SMITH: Yeah. And 33 people die every day waiting for an organ here, so I get it. But I don't get it because those are living creatures, or living organs, or however they're doing it. But to say that we're actually going to make a cloned human to harvest its organs is pretty--

DAVID: It's ethically complicated, to say the least.

SMITH: It sends chills up my spine. Why not just grow the organ, like we're doing in most places?

DAVID: Right.

SMITH: Well, why grow one organ when you can grow a whole body?

DAVID: That's the way they think.

SMITH: Yeah. [LAUGHTER]

DAVID: Do you think on some level that they're hoping that if they do enough of this hybridization that they will be able to improve upon whatever we already are? In a sense, they don't maybe have a spiritual view of this being anything perfect. They're

looking at it like a machine that they can upgrade.

SMITH: That is absolutely correct. They stumble upon things during these hybridizations. They stumble upon things that they never knew. And then some of those things I think may make it to the civilian world to help us heal. But it's just a very slow and costly thing because that's how they make their money--hey, we discovered this because we were doing this, but we just stumbled upon this just because we were doing this experiment. And then they'll take that idea, and put it in a box, and manufacture it, and sell it.

DAVID: One of the extraterrestrial species that Pete Peterson talked about, he called them the Simulacs. And they were apparently a little more simian than humans are. But for whatever reason, I guess they had tails--the tails could bend. They tinkered with their DNA and made their fingers into these long things that could curl like a tail. I'm curious if you ever saw anything like that in your autopsy work.

SMITH: No. But I have seen feet that were hands--more like hands than feet. And these are very lengthy people, very human but long-jawed, and very white--very white--and beautiful blue eyes. And they were ectomorphic, with the long, lean bones. And they had these big--they weren't feet, but large hands for feet, and just like our hands, like exactly like our hands. But they were feet. And they were not spread out like this. They were spread out really wide.

DAVID: Wow.

SMITH: The fingers would go very wide too. And a very small palm for the heel. So I think that was for the weight. And their legs were the reverse. Tibia-fibia was backwards in the femur. So if you switched your joints around, it would go the opposite way, back and up.

DAVID: Interesting.

SMITH: Yeah.

DAVID: And when you say long-jawed, do you mean that the face extended down more than ours would?

SMITH: Yeah, the jawline at least an inch. And it was a very thin face. They were very attractive beings.

DAVID: What were the size of the eyes like compared to ours?

SMITH: Big almond eyes, twice the size of ours. Smaller nose. They had teeth just like ours. And they had lips. That had no eyebrows. And their ears were oval and very

small.

DAVID: So here you are day after day. You said some days you might have even done multiple specimens in one shift depending on what the assignment was.

SMITH: Right.

DAVID: And we talked in a previous episode about how other genetic teams--you take a sample out of the cadaver, you put it through the wall, other teams start working on it. So how extensive do you think this ET human hybridization is?

SMITH: In my own opinion as of today--because I know when I left they already accomplished it. So I know as of today they have already probably duplicated 20, 30 species--cloned the extraterrestrial species to learn about them. And they have also mixed their DNA with our DNA. So I'm sure there is at least 20 to 30 hybrid species today that can be confirmed. And that's my opinion and speculation, because I know how many they had about the time I left that they were successful with.

DAVID: And you mentioned that the tiger human was one type that didn't really work out.

SMITH: At that time it did not work out.

DAVID: Oh. But it might have worked out later if they kept working on it?

SMITH: Yes.

DAVID: So what would be some other examples of a being that actually had been successfully hybridized? What would we see, just if you could give me one example to start with?

SMITH: Well, there is one of the avian extraterrestrials that I have met that are different than Mr. Goode's avians. And this birdlike human looked like a pterodactyl.

DAVID: Really?

SMITH: And they're highly intelligent. They're very nice. They're very intuitive. Of course they're telepathic. They don't really fly, but they have very small wings on the back like a pterodactyl. So imagine a pterodactyl had that thin but with a nice mouth underneath in a body, in a scaly body.

DAVID: So the really long mouth with the teeth?

SMITH: Yeah. The long face, and then underneath is a small mouth underneath the jaw.

DAVID: Oh, wow.

SMITH: Yes. So they were successful with making a hybrid one of these. And I don't know if they're doing that because it would remind people of a demon, or a dragon, or something if they wanted to use it religiously. Because definitely would get a lot of attention if this thing would walk around downtown, because it's an ancient dinosaur-looking creature. But it stands upright. And it's scaly. And it's green and red scales. And it's very large scales like a fish--really large scales. Now the back of it has these ridges that go down from--it starts at the neck all the way down the spine on both sides. And it reminds me of the back of a crocodile's or alligator's spinous process. And you know how they have all those little spikes on the back?

DAVID: Sure, yeah.

SMITH: OK. So picture that going all the way down their back into a very, very small tail near the coccyx bone. And that's what it looked like. And it was beautiful.

DAVID: And it didn't have clothes?

SMITH: No.

DAVID: What was the height?

SMITH: Eight feet.

DAVID: Wow.

SMITH: Yeah. I think they made him larger. They were trying to make him really big. But the species itself was around six to seven feet. And the hybrid ones were around 8 to 10 feet. So for some reason, they were able to use the human DNA to make these compatible. And I don't know how they did it, by the way.

DAVID: The species itself, meaning this is not a hybrid of a human and a pterodactyl. This is some sort of extraterrestrial.

SMITH: They took the extraterrestrial pterodactyl and cloned it with a human and they made this other species.

DAVID: Now, the pterodactyl head, obviously it has a long jaw. But it also has this--

SMITH: Yes.

DAVID: --flange on the back.

SMITH: Very large flange, absolutely.

DAVID: So that was there?

SMITH: Yes.

DAVID: Weird. So that sounds like some of the Egyptian things that we see. For example, they have this staff that they're always holding. And it has what looks like a pterodactyl head on that. And I'd always speculated that might be a pterodactyl that had popped through a portal or something. Do you think that these pterodactyl-looking beings might have visited the Egyptians and might have been immortalized into that staff or?

SMITH: Because of the head it's a given. You kind of know. It's just like in the Egyptian. But that's a speculation. That's not my specialty, the Egyptian. But just looking at it, it's a given. It's like, my goodness, this is so similar to what they have over there. And it's so ancient too. And they may have been here. Because I heard a lot in history about these pterodactyls and things being caught here, and also people visualizing these, and many different accounts of these beings there. So I don't know.

DAVID: Could we discuss another example of one of these hybrid beings that was successful that you got to see? You mentioned a bird-like being but that it was a bird-like being because it was a pterodactyl. So what would be another one that would jump out as a peculiar example?

SMITH: Well, not all the beings are phantasmical from Earth insects and stuff like that, like the praying mantises and people and these other lineages. But the most fascinating ones are the ones that actually look like us, the ones that are just a little bit different. Maybe they're a little bit wider, maybe a little bit taller. But they a face, they have a same digestive system. And they're just so much more advanced than us and conscious. And their brains are always larger for some reason. And that's one thing I want to point out is a lot of the most intelligent five star you humanoid-type extraterrestrials is what they really want. Because for some reason, it's the most compatible with our DNA. I wonder why.

DAVID: Right.

SMITH: I wonder why. So with that being said, any time that comes in--and I've seen these beings before, not only with my experiences on CSETI, but also in the MILABs they are the easiest to make a hybrid out of. And that's what they have done. And they have hundreds of these hybrids. So if they can get their hands on one, then they're set. It'll work out. And they've been very successful, meaning these beings are living a very lengthy life. And because of the very similar genetic code, they're just more advanced. And they have telepathy. You know they can do things that we cannot do.

They could be used for good or bad, if they would learn how to program them.

DAVID: Well, we've had several other insiders talk about draco-reptilians as being a group that now with our technology in the secret programs they might only be 40 years ahead of us in terms of where we're going secretly. And in some ways, we're now actually at parity with them in terms of warfare. So it would appear that our genetic technology is also becoming comparable with them. So they hybridized their DNA with humans, and then they act--

SMITH: They did.

DAVID: --they're our gods--

SMITH: Right.

DAVID: --that they get to control us or something.

SMITH: Yes.

DAVID: How do you see our understanding of a supreme being evolving with this genetic recombination stuff? I don't think it really would make us gods. Do you?

SMITH: No. I don't know what your interpretation of God is, but I don't believe that at all. Because if you have any similar DNA or lineage, that means you can be compatible. You can live peacefully, if you're at the level of that other civilization is the problem. They're waiting for us to get to that right level, everyone else. And there's many civilizations all around the universe that started the same time we did. And they're so far beyond us because they were not held back from free energy and anti-gravity and were not puppeteered.

DAVID: Right.

SMITH: And there's going to be a huge meeting soon with the Galactic Federation. And they will take 5 leaders from this planet. And they will tell and bring them to this galactic court and say, why did you do this? And they're going to say, these world leaders, what are you talking about? We didn't do anything. And then in the back behind them is a giant screen protecting everything they know to the Galactic Federation. And they are telling the truth. And then they will see that the 300 major corporations are responsible for the world's leaders and all the stuff they've done to all the people of Earth. So they will come back and grab them.

DAVID: So you're talking about some kind of potential criminal trial--

SMITH: Yes, huge trial.

DAVID: --in which lying is impossible.

SMITH: It's impossible. You will not be able to lie. No one will.

DAVID: Right. So there's a lot of ethical complications with trying to create designer species. But I think that maybe a deeper level we could get into is just to say that if there is a supreme being, it's the genetics itself that emanates throughout the universe. And simply combining genetics doesn't make you a god.

SMITH: No. It's like being born into royalty or marrying into royalty. It's still royalty. They still are going to accept that person.

DAVID: Right.

SMITH: So what I'm getting at is that it's still neutral. We're still going to get the neutral. It's not a good or bad. It's just still the same. It's what is programmed and what your belief system is that gets in the way. So no one deserves to control anyone against their free will.

DAVID: All right. Well that's all the time we have in this episode. Emery, thank you very much.

SMITH: You're welcome.

DAVID: And I want to thank you out there for watching. This is "Cosmic Disclosure." I'm your host, David Wilcock, with our special guest Emery Smith.

Extreme Experiments with Alien Hybrids Season 10 Episo 12

Cosmic Disclosure; Extreme Experiments with Alien Hybrids Season 10, Episode 12

DAVID WILCOCK: All right, welcome back to "Cosmic Disclosure". I'm your host, David Wilcock. I'm here with our special guest, Emery Smith. So in the previous episode, we were talking about some of these genetic programs that you were involved with in which extraterrestrial DNA was being blended with human DNA. And this gets into some very strange things. And you had mentioned hybrids.
EMERY SMITH: Right.
DAVID: So hybrid beings might have qualities that are different from regular humans, as you said.
SMITH: Right, right. Humanoid extraterrestrials are similar to us and similar to our DNA. It's a great match to make a hybrid. And, of course, they might have other abilities that we don't have like exceptional hearing, smell, taste. All the senses might be a little bit different or elevated, especially their neurological system and their brains. But they're all compatible. So it's very interesting. But during a lot of the hybrid testing, it wasn't like it just was that easy. They made a lot of mistakes. There was a lot of mutations. And during the mutations, they thought that was good. Because they would come out a little bit different, such as reduced cognitive function and a very short fuse, we'll say. They became angry, some of the hybrids. So they made an entire different program based on making sure they could mutate them. And that was a different project, a different location on this planet that was also run by the same MILABs. So they took the mutation of these genes, of all these mutated creatures, and then started mutating them even more, more, more, more. And then they became so mutated that the cells were actually dying too quickly. And they were able to add proteins to them to re-animate the body, even though it was brain dead.
DAVID: So this is similar to the concept of a zombie.
SMITH: Exactly, yeah.
DAVID: So I have heard from others before you and I ever talked about this about the zombie program. And Corey Goode independently said that he was aware of it. He might not have thought that it was as prevalent as some of the stuff that you've told me. But again, nobody really has access to all the compartments. So let's go into this a little bit. I guess to frame the discussion, first of all, we have to remember some of the people working in this black ops world are straight ahead satanic cabal. Correct?
SMITH: Correct.
DAVID: Were you made aware of certain groups that had a depopulation agenda, for example?
SMITH: Yes, absolutely.
DAVID: And what was their reasoning behind wanting to reduce the earth's

population? What was the excuse that they would use?
SMITH: Control. Yeah, it's getting too out of control for them to control. There's too many people for them to control.
DAVID: So by lowering the population, they could create the new world order concept?
SMITH: Correct.
DAVID: OK. With people that have that kind of psychopathic cultish background, why would they see this as useful? What would be the agenda here?
SMITH: Well, they made it look like they could use it for maybe war or something, dropping in some psychopathic hybrids in an area and killing a bunch of people. But it actually became more ego-oriented with the cabal. And what I mean by that is they were funding a lot of money into these underground--amazing underground facilities that were growing all sorts of hideous things, mixing all sorts of hybrid DNA. Don't forget this is all because we were mixing ET DNA with human DNA and not doing it--maybe it's just at the right temperature. And things would happen. They would mutate into very different things because it does have to be just right.
DAVID: Now, most people who are familiar with traditional ufology are going to be thinking Dulce, New Mexico. Have you ever gotten confirmation of that kind of stuff being in Dulce?
SMITH: No. Actually I've heard them storing a few of these beings there. A few meaning a few hundred. But actually it was at a separate facility not in North America. That is the underground facility. And mainly for safety, because if something were to break out, such as a virus or something, they didn't want it to be here first, even though the funders live here. And the corporations are based out of the United States of America.
DAVID: In a previous episode, you mentioned some sort of weird bear human hybrid breaking out and causing a lot of damage. Is that different from what we're talking about now? Or is this a similar type of idea?
SMITH: It's different. They were really trying to make a type of hybrid animal actually. But it didn't have human DNA in it. It was more animalistic and programmable. And it was more geared up for, like, the osseointegration projects in the early, early years of making a super warrior animal that could assist the troops or at least just be dropped in a zone and destroy everything before it was killed.
DAVID: So these hybrids that we're talking about now, they have extraterrestrial DNA. But would they look extraterrestrial?
SMITH: They may or may not, depending on the percentage of DNA that they have that is human. Because they have to have a pretty close match, number one, for it to work. And that's when mutation happens. When you push the envelope of percentages of human genomes and interacting with making a human from two different types of genes, it can get really tricky. That's why they had all these mutations. But then, the more human extraterrestrial DNA they got that was more similar to humans, using humanoid extraterrestrial, then they've perfected it. So it would be OK.
DAVID: So what were some of the extraterrestrial genetic components that advanced

these hybrids over what we would normally be like? What were some of the special features, let's say?
SMITH: Well, it could be anything from height, higher metabolism, that you didn't have to eat as much, eyesight would be amazingly increased, taste. All the senses are usually enhanced. But the most important thing was cognitive function and also having a better awareness than a normal human. So they were more aware than a normal human. And they also had higher IQs than humans.
DAVID: When we're dealing with these malevolent hybrids, these zombie humanoids, what aspect of extraterrestrial genetics was added? And how did that affect them?
SMITH: What happens is when they're making hybridisation, many things can go wrong. Like I said, it could be just a small temperature thing when they're growing these beings. And once they start mutating, then you've basically lost the entire project. Once a cell starts mutating, then it's not going to come out perfect. It's going to be very different as far as cognitive function. And what they do is they'll add chemicals and amino acids and peptides and hormones. And they'll try to regulate it. And if it doesn't go well, they still let it grow. And then they take that genetic DNA from this, and then they take it over to that place, that other MILAB. And they usually shipped the whole being and everything. And then it's stored there for those scientists to make it even worse. They may add animal DNA to it. They may try to make a disgusting creature or being. And that's why I said it was ego-related because it is being funded, but it wasn't performing anything. There was no performance factor. We always had performance factors for all of our MILABs. If you don't meet your performance factor, your whole project gets shut down. And that might mean just meeting a quota. Or it might mean collecting more ETs or beings or whatever. So getting back to what you just said, it has to do with when we're growing these beings, if they're going to come out good or not all depends on the environment and if the DNA is a match or not. And if not, then they would genetically, and using frequencies, try to trick the DNA to making it think it's a match. Yes.
DAVID: So if we're having a program that doesn't really have a desirable outcome right off the bat, there's no immediate benefit, with these psychopathic cabal people, they're looking at it in a different way. Are they looking at it as a weapon system of some kind?
SMITH: Kind of a fear factor de-popularization factor. They could easily introduce a couple of these beings. They might go into a city, carry a virus, and easily transmit this virus to a human. And that human would mutate as well.
DAVID: Really?
SMITH: Yes. Yeah, not instantaneously, but pretty quickly.
DAVID: It would appear, then, that the media has already been greatly telegraphing something like this. In other words, there's a lot of movies. And there's a lot of television shows like "The Walking Dead".
SMITH: Oh, right.
DAVID: Even the second "Maze Runner" movie turns out to all be zombies. So it's as

if they're telegraphing something that they know they already have to generate more fear. Would you say that's true?
SMITH: Yes, that's exactly true. So I really believe though, even though they may have thousands and thousands of these beings ready to go or doing what they want to do, however they're utilizing it, setting up centers to do mock infections, underground cities and stuff, and using real people for that and clones and programmed life form clones to be utilized in these mass releases of these creatures into a population to see what would happen.
DAVID: You're saying simulations.
SMITH: Simulations, yeah. And I think it's more for the enjoyment of the cabal, to be honest. Because I do not believe that the extraterrestrials would ever let something like that happen. And I also don't believe the Alliance is going to let that happen either.
DAVID: Well, it's interesting because I have another high level insider that gave me a lot of information about the zombie program. And he said that there have been multiple times that the cabal thought they were going to release some of these creatures into our society. And they would have angelic intervention. They would have benevolent ETs, light being type ETs, the really advanced ones, that would completely stop anything like that from happening. And so what he said was that they ultimately had to scrap enormous programs that they thought they were going to be able to use because no matter how they tried, no matter which way they tried to flip it around, they just couldn't get it authorized. It's always about authorization for them. So would you feel that's true?
SMITH: Yeah, I would say that's very accurate.
DAVID: Let's talk a little bit about these simulations because what you're describing now is something you and I have talked about quite a bit. And it is disturbing. But I think it's important to get a little bit deeper into it than you did. Paint the picture now for what would happen in a particular underground facility if they were going to make a simulation. What would we see just as the chessboard?
SMITH: It would be like a Hollywood production studio set up where they would take a center of maybe Miami or just a city anywhere and then mimic a few blocks of that in an area. And then cloned humans that they would just wake up already programmed with something in their head, like they think they lived there their whole lives or whatever.
DAVID: And they wouldn't realize they were in an underground base at all?
SMITH: They would not even realize that because they're going to be dead in 10 minutes or infected.
DAVID: Right.
SMITH: Because you have to remember this has to do with de-population programming. So what they want to know with these simulations is one thing. How fast can we get this virus to spread? And how are the people going to react? And how many of them are going to fight back and how many won't? And who are they going

to call? Who are they calling?
DAVID: Right.
SMITH: So they're very smart about what things to look for. But I think it's just a big chess game for them. I think it's just a big fantasy game. I don't believe--but billions and billions of dollars are put into these little chess game projects.
DAVID: How would a particular simulation come to a conclusion? How long does it run, and how do they conclude it?
SMITH: They conclude it when all the humans are dead and the virus has spread.
DAVID: So you and I have talked about the "Resident Evil" movie series.
SMITH: Right, yeah.
DAVID: And we've watched some of them together.
SMITH: Sure.
DAVID: So how does "Resident Evil" play into this? I mean, it's a large movie series. There's like nine of them or something.
SMITH: Well, you have the cabal. I mean, it's a perfect description of a cabal.
DAVID: There's this umbrella corporation.
SMITH: You have this corporation umbrella. And they basically were a regenerative medicine corporation, if you read actually the story book of whoever wrote it. And what they were doing is trying to regenerate cells for face creams. So it's a great storyline because a lot of these big pharma corporations are behind it--a lot of these things. So this medicine actually went bad and started actually destroying the skin cells. But it also re-animated them at the same time. So it was really new. It was kind of like destroying, dying, killing, dying. Because you want to kill your skin cells that grow back faster. So it was a great concept. And the thing was they had an underground base somewhere in the United States of America, which was very realistic.
DAVID: In the movie.
SMITH: In the movie, which was very realistic.
DAVID: And that's the hive, right?
SMITH: Yeah, the hive.
DAVID: OK.
SMITH: And I couldn't believe they actually show schematics. Because there's many bases that have this hive looking type base on that movie.
DAVID: So it's very, very accurate.
SMITH: Very accurate.
DAVID: One of the things that I thought was so weird about this movie, first of all, the "Resident Evil" movies are all basically zombie films. Pretty much zombies show up in every movie.
SMITH: Right.
DAVID: So you go in. You have this Templar type of symbol for Umbrella Corporation. They show you this over and over again. And then you have this underground city. And one of the things that I found really weird, Emery, was the number of props, the number of details, the amount of sets that seemed overkill. You

don't need that much detail. And so how did the scenes in the movie equate with what you actually knew to be true?
SMITH: Absolutely. It was probably one of the most realistic sets I've ever seen in my life. I was actually shocked the first time I saw it because I could not believe they would show people such detail of security, detail of how the lab is set up. Even the props were real props--the vacuum closed system rooms, the overhead hoods with the gloves and using the special boxes to keep the viruses in. Especially what got me was the dogs that they use for being aware of certain chemicals. That all the viruses in these vats, if you break one, has a special chemical in it that the computer knows its in the air system. And then dogs start barking, alarms start going off. So it was very accurate, especially utilizing an underground base. Having a secret entrance a couple miles away from the base is very popular. Having two agents that play husband and wife is very popular. You might have someone living right next door, and that's really an entrance to a base in a suburbia. And you wouldn't even know it. So it's a very interesting story line. And everything in there was very accurate, as far as the AI as well. They use a lot of AI now for running the base because they don't trust humans.
DAVID: And there's also these sort of boss enemies in the movie, these weird hybrid grotesque beings that are not just the typical zombies, but like--
SMITH: Oh, right. And that's a perfect description of the mutated extraterrestrials and humans. So they can get up very large, these beings, and very grotesque looking, and only have one thing on their mind. And they do mind control on those beings too and program them to go to this place and kill this or destroy everything. So they have the ability because they have the cerebral cortex still working.
DAVID: Let's talk a little bit about what are some of the countermeasures that have been done, even with people here, to stop this.
SMITH: Well, I think, like I told you before, anything that's going to destroy more than 70%, 75% of the population, the ETs are not going to let happen. So if they were to release a virus like that, it would destroy pretty much the entire population almost unless you have the antibodies for that. So I think it won't happen, number one. And number two, if it did, I'm sure the white hats and the Alliance already has an antigen for that that could easily be put in the atmosphere. And we would all be fine. I mean, I really think they have our backs.
DAVID: Has the Alliance been actively invading these facilities and shutting them down? Is that part of--I've heard this from--
SMITH: Yes. Yeah, they've been getting in there. They have a lot of moles in there seeing how far they're going and securing our best interests at hand, for sure. And that's why I'm not really concerned about it. So it's more of just an ego, like I said, thing.
DAVID: Right. And I've heard from other insiders that they've just hit brick wall. Any time the cabal's tried to do even the tiniest bit of this stuff, they just hit brick wall, brick wall. Can't get it to work.
SMITH: They can't because they're trying to put DNA together. They don't have the

right people. They're having some really severe issues, like I said, mixing the DNA. Of course, let's say, for instance, dogs--you can mate dogs all over the place, I mean, all different kinds of dogs. They can all have puppies.
DAVID: And they're all descended from wolves, usually.
SMITH: Right. They all come from one, the wolf. So what they don't understand is you can't get certain mutated ET DNA with human ET with another mutated different ET human and try to make something out of that because those are definitely not from one.
DAVID: Right.
SMITH: Because they're from multiple different.
DAVID: All right, well, let me ask you this.
SMITH: Yeah.
DAVID: If we're looking at us evolving and becoming a spacefaring race, which we already have the technology. It's just not being disclosed to the majority of us. Then much in the same way that we have different races on Earth that actually, from what some insiders tell me, the races we have on Earth are much more different looking from one another than most other ET planets, that they're often very similar looking to each other. Would you say that's true?
SMITH: Absolutely, that's true. We're a very diverse society. So we have many different lineages from many different extraterrestrials. But we're still all able to mate and have children. But we still have very different lineages. You're correct.
DAVID: So as we grow up and become more of a galactic family, how does this work in terms of sexual reproduction with other humans that might have evolved on other earth-like planets? Is that possible based on your knowledge?
SMITH: Based on my knowledge, absolutely possible, 100%. And it's kind of like the dog theory. There are many different kinds of dogs. There's many different kinds of humans. But guess what. We all come from one.
DAVID: So how do you think this could play out in terms of maybe the greater plan of how we evolve through the changing conditions on Earth? I mean, I don't know what you've heard about this, but we've talked a lot about the changes in the sun, changes in the solar system, and that life on Earth, that the conditions will be very different. Have you heard about the idea that our solar system is undergoing some sort of change?
SMITH: Yes, I think you're probably referring to the solar flare and different other planets nearby. There is a huge change in the solar system. Absolutely. And we will be affected. Our light bodies will be affected by this.
DAVID: So do you think that if we start to meet other races and we begin to have this sort of cross-cultural coupling take place, that this could be part of how humanity evolves in some way?
SMITH: Not only evolves, it's how humanity survives.
DAVID: What are some of the positive aspects that might happen? Like let's say that we meet up with a race that's much more spiritually adept. If we coupled--Like for

example, you look at Greek mythology, right? You have gods. You have what they would call men. And then you have heroes. And the heroes are the offspring of gods and men. But heroes would be like Hercules. These are people that have stupendous superpowers. And they're not even full gods. So are you aware of there being humans out there that have abilities like what the gods would have had in the Greek mythology?
SMITH: Yes, I am.
DAVID: And this would include what kinds of superpowers?
SMITH: Well, powers that we would look in our history of levitation, not having to eat, things like that, able to produce light and fire, able to travel in space, able to not have to worry about temperature, not have to worry about oxygen.
DAVID: Bilocation?
SMITH: Yeah, bilocation.
DAVID: Telepathy?
SMITH: Yeah, telepathy is a big one. A lot of cognitive function powers that we don't have that it's just so far above us. We wouldn't understand because they're able to connect to the cosmos.
DAVID: Do you think that at some point people like this might deliberately want to start coupling with us in order for the greater good in some sense, like the idea of heroes being born?
SMITH: I do believe that we are the superheroes of the universe--earthlings, believe it or not. They look upon us as the superheroes because if we don't exist, they don't exist. And they also look at us like, wow, they get to taste and hear and smell and see. And they don't know. Some of them don't know what that is. Some don't have full digestive systems because their planetary atmosphere gives them everything they need. So we are looked as heroes, believe it or not. We look into the movies and look at these extraterrestrials in the skies above like, wow, that's so amazing. But really, they're looking back saying the same thing.
DAVID: There's a lot of talk about the pineal gland. So many ancient cultures, this gland in the middle of the brain--and I studied the physiology.
SMITH: I know you have, right.
DAVID: And it's got retinal tissue.
SMITH: That's right.
DAVID: And there's this water in there. And so we're hearing that--from various insiders, I've heard that the pineal gland functions as a star gate. And that if we have a fully activated pineal gland, that we would be like gods. We could go wherever we want. So don't you get the sense with all these humans out there and how advanced they are, that we're spring loaded? There's something about this that we're not using.
SMITH: Oh, yeah. We have everything that everyone else has. We're just not activated yet. And it's silly because that's why we are the superheroes. We have more than everyone else, believe it or not. So it's like if we could just figure out that code and get that download and ascend properly, then we could be a flash of light or take

this form or any form we want.
DAVID: One of the interesting things that Corey Goode has shared with us is this concept that a variety of different ET groups--and a lot of which are more human like--that in his program they call genetic farmers were apparently taking the very best ascension type of DNA and then mixing it all together here--that they had 22 major different programs on Earth. So do you think it's possible that--because you kind of said that. Not quite as specific as I said, but do you think that Earth might be sort of like a garden in which these advanced super powers have been stored inside of us for future activation?
SMITH: Yes. That's exactly right. It's the womb that we're still growing in, and still evolving in, and waiting to be activated, and reaching out, making the intention to reach out, to be activated, and to ask for other cultures to visit, and to be part of that.
DAVID: When I read the "Law of One" material, I started to have psychic experiences. I started to hear voices that were benevolent, positive, giving me positive guidance. And they call that tuning. And so I'm curious if you feel that even apart from the sexual reproduction thing, just simply being exposed to advanced humans, simply talking to them or being in their presence would start to activate.
SMITH: It would totally activate. Your field that you put off is everywhere. And it's, of course, right here most concentrated. So being in another person's field, someone comes home angry and then everyone else gets angry in the house. Or someone comes home laughing and giggling, the angry person at home starts laughing and giggling. It's the same concept. But it actually does a frequency change to modify DNA by being around people that you want to be around and being around beings that have a little bit more, say, energy and frequency than you do. Because it ups your frequency. Because you have to get to that frequency.
DAVID: I remember talking to Henry Deacon, who was the first really heavy duty space program insider who I got to talk to. Unfortunately, he's never been willing to come forward now. He did come forward a little bit back in 2009 in public after talking to me for two years. We had extensive conversations. And he said that the feeling of love and peace around some of these extraterrestrial humans was so amazing that it was literally--it would bring you to tears.
SMITH: Yes, overwhelming. First hand experience is the most overwhelming feeling of love and compassion. And you can't even speak. You're just so overwhelmed with this joy feeling, and you do. You start crying. You might fall to your knees. You might just pass right out. It's that intense. Because what these--not all extraterrestrials, but most of them have this ability and compassion for us and they love us so much that if you get next to one of these extraterrestrials, you can not even--you'll just get all teary eyed and laugh and cry at the same time. It's a beautiful, beautiful thing.
DAVID: That's really amazing.
SMITH: Right.
DAVID: Well, I want to thank you again for bravely exposing some of the things that are going on. And I do believe that when we speak truth to the power, we empower the truth. Thank you, Emery, for being here.

SMITH: You're welcome.
DAVID: I want to thank you for watching. This is "Cosmic Disclosure." I'm your host, David Wilcock. And I'm here with Emery Smith.

Viewer Questions 13 A New Future for Humanity Season 10 Episo 13

Cosmic Disclosure; Viewer Questions 13 A New Future for Humanity Season 10, Episode 13

DAVID WILCOCK: All right. Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. I'm here with Corey Goode, and we have had so many conversations and questions that have arisen on Corey's fascinating update that we've covered in previous episodes that we decided to just answer your questions in one episode because there's so many of them. Well, Corey, welcome back to the show.

COREY GOODE: Thank you.

DAVID: The first question is, could you please clarify the advantages and disadvantages of having our solar system's outer barrier removed? Does this mean, for example, that beings like the Dracos could now just come and go as freely as they choose?

GOODE: Yes, it was communicated to me that with the barrier down now the portal system was completely open, that beings can come and go through the portal system, but that that is extremely monitored, heavily monitored. They can tell by the electrical feedback of a jump from one place to another how many hops you took, how many connections you hit, before you ended up at your final location. And they can track you down. They said that whoever does escape through the portal system will be on the run for the rest of their lives because there are no real safe havens around anymore for the negative groups.

DAVID: Now you've mentioned before the Draco kind of have a big enclave in our solar system. So is this a major defeat for them once this solar flash takes place if they're trapped in here?

GOODE: Well, before the solar flash, they're all going to go into like a stasis or one of these temporal bubbles where they hide out until after this energy passes through our solar system for over a thousand years. And then they plan on coming back out and reasserting their authority. But it is going to be our duty to go down and root them out once the solar flash occurs.

DAVID: OK. So the next question we have is someone said, Sigmund says to you, "intuitive empath, my ass." And the person said, "I think he was implying that you are not an intuitive empath. Could you explain exactly what he was thinking from that statement?"

GOODE: Yeah he was definitely implying that my intuitive hit was incorrect.

DAVID: So did he have some implicit assumption that intuitive empaths should be this amazing psychic who's always right?

GOODE: Yes. He was basically under the impression, you're supposed to be psychic. You should know everything. There's a reason they'll use three of us in a situation to triangulate. It's because none of us, even when we're enhanced, with the serums are 100% accurate.

DAVID: Right. Next question we have says, ultimately, "the Draco are just pawns of this AI that is actually manipulating them. So if the AI is really responsible for all of this, and it still isn't being defeated when the Draco are defeated, then how do we know that we're not just going to become slaves of the AI?"

GOODE: Well, part of this process is that when a series of solar flashes occur, after the sun comes out of what it's in now--solar minimum, which is about 11 years, it stays in solar minimum--they expect when it pops out, it's going to do so in a spectacular fashion, that there are going to be a number. And while it's a minimum, they expect some flashes as well. Some have already occurred. And this series of solar flashes is going to be basically like an EMP to the artificial intelligence. All of the technology that it inhabits will be destroyed, and the AI signal will not be able to permeate our region of space because of this energy that is emanated from the sun as feedback from the cosmic web.

DAVID: How do we avoid being destroyed by the loss of our technology if that is to happen?

GOODE: It will be a rough time. People--there will be loss of life. There will be some bad things that occur. But that's going to be the point to where a lot of these breakaway civilizations that break positive for us, after all this happens, they're going to see that as an opportunity to bring down all of these advanced technologies to everyone on the planet at the same time and not just give it to a few elite countries and let it filter down to the rest.

DAVID: So are there radiation hardened technologies that will be able to withstand the solar flash and will still be operational after it happens?

GOODE: They think that they have some of their technology shielded enough. But from what I've been told, no matter how far you go down in the Earth, it's going to penetrate.

DAVID: But they do feel that they can release technology after this happens that we'll be able to use?

GOODE: Yes.

DAVID: Interesting. A similar question that occurs to me right now is, if the AI is essentially EMPed by, as you've said, the final of a series of solar flashes--it's the biggest one in 10 or 11 years from now--what prevents that AI from just immediately zipping back in on these photons that you say have the AI signal in them?

GOODE: After the thousand years, that signal will come back into our solar system. We will just have a different type of technology developed out, and we will be aware of the AI threat. And we'll be able to mitigate it.

DAVID: So it is, essentially, everywhere, but we're just like--it's like an immune system learning how to have antibodies to fight this.

GOODE: Right. The AI signal's being broadcast from many different galaxies all around us. There's no hiding from it.

DAVID: Next question is, "William Tompkins urged us to get involved. How do you think we should get involved if we want to defeat the Draco and heal our society?"

GOODE: It pretty much goes to each individual. Each individual has to do the personal work to make sure that they don't have karmic entanglements. And we need to start focusing our intent, or our co-creative consciousness, on a positive outcome. The more of us that do that, the easier it will be for us to attain a positive outcome. And right now we're seeing what Tear-Eir called the Great Awakening occur on our planet.

DAVID: Well, focus our intent is sort of a general term. Could you maybe get a little more specific about what would focusing our intent look like?

GOODE: It's just as simple as it sounds. Focus your intention and energy--thought energy--on a positive future for humanity and outcome. That's the secret of their black magic is being able to drop some morbid details or ideas on us about a cataclysm or something that will happen. They'll drop that into our consciousness, and a lot of times what occurs is that we make it happen through our co-creative consciousness. We're manipulated.

DAVID: So in a sense then, we have the power to steer this however we want.

GOODE: We always have had the power. We've just been kept ignorant of it.

DAVID: So why do the Draco then seem so compelling in what they're doing? If they're only doing what we allow them to do, why have they been so successful?

GOODE: Because we've allowed them to do it. You know, we've given some sort of tacit agreement by not fighting it and by allowing ourselves to be manipulated.

DAVID: If the Blue Avians said to you that we should get off of our knees, did they get more specific as to exactly what that means--that specific motif of standing up off of your knees?

GOODE: Yeah. It means that we've been programmed as a species to be watching for someone or something to come and save us. That is a part of the programming that keeps us ignorant of our co-creative abilities. Once we realize our co-creative abilities, we realize we don't need a savior. We are the ones that we've been waiting for.

DAVID: Very interesting. OK. Next question we have is, "in order to really get rid of the reptilians, do we have to wait for the solar flash to happen?"

GOODE: Yes. To root out the last of them, yes. Because that's when they're going to go into their little stasis areas to hide out. And they won't be able to come out because of the energies. It's putrid to them. They can't handle it. And it'll be like shooting fish in a barrel, I'm told.

DAVID: Next question we have is someone said, I'm wondering to get a little bit of clarification on this. Humanity's cosmic family--this was your quote--"humanity's cosmic family will come in and assist us in raising us to the next level of human evolution and growth." So could you specify what is the cosmic family? What is the next level of growth?

GOODE: Well, the cosmic cousins are family. They are human beings almost exactly like us, just different types, that have already gone through this process. And what is going to happen is that after the Super Federation is fully disbanded, they are going to bring these local 52 star cluster inhabitants, representatives, to that Super Federation facility to interact with us and help us be advisors, advise us through going through the rest of the process.

DAVID: The question also mentioned genetic growth as well as spiritual growth. So how would humanity's cosmic family assist us genetically at that point?

GOODE: They assist us with the beginning of taking over our own genetic program. What that entails, I don't know. But I received some information that after humanity finds out that there is a genetic program going on and that we're a part of it, that we sort of rebel. We become extremely upset about it. You know, we all think we're these beautiful sovereign beings. How do we then put that together with the fact that we're just lab mice to more advanced beings? There's quite a cognitive dissonance issue that occurs. It's going to be a rough time.

DAVID: OK. The next question is what is the nature of the classes that we are going through with dreams. Is this something akin to sitting in a class in at school? Or is it more symbolic in nature? How is this dream education exactly taking place?

GOODE: Well, from what I'm told numbers of people are meeting in the same place etherically and are in classroom settings, to where at times I've been used as an avatar to teach people. People see me in their dreams in classroom environments all the time. That's been reported. And I really have no memory. I always said, they must be using me as an avatar, their higher self, or something like that. But what I found out from the Blue Avians is that, indeed, we have been doing a lot of this dreamwork with people and helping train people. It's a spiritual thing, a spiritual level.

DAVID: So there are classes in some cases?

GOODE: Right. Classroom environments is how people are perceiving this etheric event. They're seeing--their higher self is displaying it to them as them sitting in a classroom. I really don't know exactly the setting etherically that is going on.

DAVID: Well, I find it interesting, Corey, that in the Law of One, one of the most common terms they use for ascension is graduation. And I've had myself many, many of these dreams about a graduation ceremony. So do you think these graduation dreams could be part of the classroom ideas as well?

GOODE: It could be, but the graduation that we're going to go through is a much bigger event. It's this Great Awakening.

DAVID: Right. OK. Now we have a question about the galactic slave trade. With the fact that humanity has been traded off so extensively in this galactic slave trade, is the next big push in the battle of good versus evil going to be the war on slavery? And will those people that were extracted from here be returned to their homes?

GOODE: Yes. Now we're already seeing a big war on human trafficking--

DAVID: Right here on Earth.

GOODE: On Earth, yeah. What occurs on Earth--there's a lot of human trafficking. It just really hasn't changed in the thousands of years that we think we've evolved. It's just as prevalent now. But a good portion, over a million people a year, that are a part of the slave trade are going off planet. And as we've described, they're traded for many, many different reasons. What's been occurring for some time is that they've been operatives--SSP Alliance operatives--that have gone in--and I partook in this. I myself helped do this. They are tagging these victims as they're being sent off. And at times, a number of them have been rescued and then brought to this planet that the Mayans control that is basically a healing planet, where they take people to heal. So

that's already occurred. What I'm told is that it's going to happen in mass. They're going to go, and they're going to find--I mean, there are going to be millions of people out there that were traded off that are going to be rescued and brought back to a planet for a number of years where they're going to be healed. All the trauma is healed. And once they are to a certain point in their healing, they will be reintegrated with people on Earth. But in the process, they will let people on Earth know that a loved one is in this program to be healed.

DAVID: OK. The next question is that you mentioned seeing a person on the LOC with a NASA badge. And this is not something we've heard before on "Cosmic Disclosure" in any of your testimony. So could you please expound on the implications of seeing somebody in this, allegedly, simple program of NASA that's not supposedly involved in anything deeper?

GOODE: Recently, Emery and I were talking, and there is an Air Force Space Program and an astronaut school where they train Astronauts. It's up by the Great Lakes somewhere. And there are dozens of these astronauts, and they're the ones that serve on the Military Industrial complex space station and operate the triangle vehicles that service it. So apparently they are allowed at LOC Bravo and LOC Bravo is the only see that they know of. They enter it from a totally different way. And we were--what we were told we couldn't discuss with the egghead-types, especially where we had just come from--LOC Alpha.

DAVID: So Emery has mentioned this secret NASA. What do you think would be the size and the scope of the secret NASA as opposed to the public NASA?

GOODE: Well, when I knew--I mean, it was a long time ago that I was briefed on that, over a decade ago. I mean, it's been a while, but there were only like a few dozen.

DAVID: Oh wow.

GOODE: Yeah. Astronauts in this program.

DAVID: OK. Now we have another question about that NASA. Has NASA's presence on the LOC been hidden from us because of exopolitical factors? Did the presence of NASA occur recently? Did the Cabal throw NASA bone to let them feel better about what they're doing? This kind of question.

GOODE: Well, this is the military branch of NASA, not the public relations branch that we know about. This military branch of NASA, I believe, has been allowed access to the LOC Bravo for quite some time. It's just they don't know about the other LOCs. They think they're going to the LOC. And just like how I was talking about LOC Alpha as the LOC because I didn't want to acknowledge the other two.

DAVID: Do you think that this secret NASA knows about the MIC Secret Space Program?

GOODE: They're a part of it. Yeah, they're a part of it.

DAVID: So it's just one of the divisions?

GOODE: Right. And they even have a small base on Mars that they have access to?

DAVID: And what would be the function of that base?

GOODE: Research and development.

DAVID: What are they researching?

GOODE: Technology. They're building out technology to expand the human footprint in space, but they don't realize that it's already expanded.

DAVID: OK. So the next question. In an earlier episode, you mentioned going to the Mayan ship and that there was a reptilian being that was killing people there? How did this being end up being able to kill people? Was it using a technology? Or was it some focus of its consciousness? How was it doing this?

GOODE: No, it's the most bizarre thing I've ever seen. It was a silent, psychic war that was occurring. It was really weird. What happened is that the Mayans had located this being somewhere in southern Africa in a city that they knew about. And they'd been monitoring, looking for this being for a while. They located it, and they used their technology to flash it out of the cavern city it was located at to their ship. It appeared on the ship, and the Mayans were overconfident about their abilities. And they thought that they were going to be able to put this being immediately into stasis. What happened is this being appeared, and they weren't able to handle it. And it used its extreme psychic abilities to kill--it was between five or seven of these Mayans. And the tools that they were using, weapons, they were holding up like this, and their eyes were just above this part of what looked like an ax handle, and they were kind of hunched over walking into the room like that, like It was a shield and a weapon at the same time. Basically, the reason it happened is that the Mayans underestimated this being and how powerful it was.

DAVID: So the next question is have the ETs stopped upgrading our DNA now? Or will the next big upgrade take place after the solar flash?

GOODE: They're still tinkering and winding down their various projects. But a lot of the genetic tinkering that's going on is going on by humans at the behest of the Draco. So we still have, through like flu vaccines and all kinds of other methods, they are

using viruses as delivery systems to make genetic changes to humanity. Apparently, before too long, we openly and overtly start taking over the management of our own genetics, and we go the designer route there for a while apparently.

DAVID: OK. This next question kind of relates to a discussion that I had with Pete and gets into some confusion that we had which is, are the Anshar the same Tall Whites that Charles Hall reported interacting with in the Nevada Desert in the 1960s?

GOODE: I don't think so. The physical descriptions don't seem to match. The fact that in the military they call the Anshar--they have called them the Tall Whites because they're tall, they have blond hair, and very alabaster skin. But just like they call a number of different beings Greys--the same thing happened in Nordics, they call a bunch of different beings Nordics--they get lumped in. The group that Charles Hall was interacting with seems to be a totally different group. Now I see the confusion because as they get older they grow taller. But what I'm told is that fourth density in higher beings that this is fairly common. It's a common part of their lifecycle.

DAVID: These different growth cycles?

GOODE: Right.

DAVID: Yeah. So Pete was also just saying that the terms that they give these beings just relates to how they look. It's very crude. So you have Saurians, which would be reptilians, that kind of thing.

GOODE: Yes.

DAVID: So a Tall White just means of tall being that's got white skin?

GOODE: Right.

DAVID: OK. The next question is, of all the different races that you saw among these 52 other witnesses, were they all familiar to you from before or were you seeing some that you had not seen before?

GOODE: No. There were a few that I had seen in the Intercept and Interrogation Program, but for the most part, other than Mica, they were new to me. But species-wise, there were a number of them that had been caught up in the Intercept and Interrogation Program.

DAVID: Of those 52 other people each representing a race, how many of them do you think could just pass for a human from Earth without any difficulty?

GOODE: Many, and many of them are here right now. These beings are a part of this

Cosmic Peace Corps that I've discussed before. They're here assisting humanity, and they blend into areas that are most like them ethnicity-wise. If a group looks more Asian, they're going to be inserted into the Asian region. And they are studying us, building up a plan on how to help us. And each of these groups are studying different aspects of our civilization to know how to approach us with a program that will assist us.

DAVID: When I had Law of One discussion forums, going back to '99 through 2003 thereabouts, a lot of people got confused about ascension, where like there's a Rainbow Body ascension where your body completely transforms into light and then there's this force density activation that the Law of One talks about. Do you think these were ascended beings? And if so, what type of ascension had they gone through?

GOODE: Yes, they were all what we would consider fourth density. And they had gone through the same energetic change that we had that rearranges their physical molecules. But it's more of a consciousness shift. Their consciousness was expanded to a point to where it'd be like going from a 2D world where everything is flat to a 3-Dimensional world where all of a sudden everything has depth. We're going to go through that type of a consciousness shift to where 3D is going to seem like 2D to us. And once that occurs, we start thinking in a different way and interacting in a different way. We understand how to control our co-creative consciousness and create whatever reality we want. We're able to have control over matter.

DAVID: But if they popped into fourth density fairly quickly, then you're not seeing them with larger eyes or skinnier faces or anything like this.

GOODE: They don't look any different really than they did before they went through that change.

DAVID: Interesting. Now that humanity is on the council, how often do they meet and who is humanity's representative?

GOODE: Well, humanity is humanity's representative. Now this hasn't kicked in yet. They're not meeting yet. It's all being prepared and organized. And the current Super Federation is going through the process of winding down their projects and curtailing them. So we're not having meetings yet.

DAVID: When you say all of humanity is humanity's representative, does that imply that there will be some sort of governing aspect to it, that it's not just going to be one person making decisions?

GOODE: No, it's not going to be one person. It will most likely be how it is now--a different person from each region rotating in periodically.

DAVID: Representing a democratic vote for that region.

GOODE: No. They'll be representing the entire Earth, but they'll have representatives from each region so that they know that everyone's being fully represented.

DAVID: What do you mean by region, though?

GOODE: Well, you know, like Asia, Africa. And within there, we have different countries, and people will rise up as ambassadors in each of those, and they will be rotated through the program.

DAVID: And the way this is designed is intended for everyone to have a voice.

GOODE: Right.

DAVID: So those representatives will be pooling information about what their people want and what they're looking for and bringing that to the attention of this council.

GOODE: Right. And just representing the entire globe but from their regional perspective. And that was we get the full perspective of every region in the management.

DAVID: OK. The next question would be--and this is a little bit of a confused question perhaps--but who currently is giving orders to Solar Warden, the SSP Alliance, and the MIC SSP.

GOODE: It's very complicated. The SSP Alliance has its own council that makes decisions. Usually, they obey the council. Sometimes they don't. A lot of the command and control of the Military-Industrial Complex SSP is technologically done from places like Eglin Air Force Base and MacDill. But the decision making is occurring at places like the DOD and the DIA within the DOD. Now the Interplanetary Corporate Conglomerate controls the production of the technologies that go to all the different space programs. But all the different space programs are headed by different organizations, all of which at one point were infiltrated and controlled by the Cabal.

DAVID: What about Solar Warden?

GOODE: Solar Warden is no longer called that. I'm trying to get the current operational name. It's had several. But it is also controlled through the DOD but on the Naval Intelligence side.

DAVID: Well, I thought it was a breakaway civilization, though. So how would the DOD control any aspect of it?

GOODE: The Solar Warden program was not a full breakaway civilization. The full breakaway civilization is basically the ICC and the Nazi faction. They are completely broken away, and there is no--I mean, there is no command and control on the Earth at all. The military organizations or programs have command and control on the planet. So therefore, they could not be a fully brokeaway civilization.

DAVID: OK. The next question is kind of an interesting one. Who on Earth is the main human interface for the Draco?

GOODE: There's not one main interface. There's an organization that, I've been told, does most of the interfacing with the Draco. And it's the Council of 200, and they're made up of elite types, financial elite types, from all over the planet.

DAVID: Now there is this idea that in the highest highest levels of the secret societies, they have something called the Palladian Rite, where the goal is to become the glove of the secret powers that run Cabal. So do you think that some of these guys are using the Palladian Rite and doing a telepathic interface sometimes with the Draco?

GOODE: Well, the Draco are interfacing with people all the time just like the Anshar are. A lot of times they have--they'll do out-of-body experiences and go to people's homes and stuff like that. The main body that has access to these Dracos Royals is this Council of 200.

DAVID: Next question we have is one you've tackled before, but it has come up again. Why can't we get any good pictures of ETs or UFOs from the work that you've been doing? And why wouldn't the Alliance be able to authorize the release of photos or video of things that they want us to know about at this point?

GOODE: Well, the Alliance is in negotiations basically with the Cabal, negotiating their surrender. So they're going to do everything according to this plan.

DAVID: So would part of the plan involve them releasing videos and photos that are real at some point?

GOODE: At some point. But at this time, it's really against the cosmic law. They're interacting with beings that are a part of this cosmic law, and they're not supposed to show us video or images of these beings. People have given me a lot of problems saying, why don't you take photos or whatever? But you know, even if I did deliver a photo or a video, people are going to say, well, that's just CGI. He did it on a computer. So photos, these days, are not the proof that most people claim.

DAVID: Well, since this comes up so often, let me give you a paraphrase of something that's in the Law of One several times where they talk about the idea that

their mission is to offer truth without proof. And they even make it rhyme. And they say that their goal, their mission, is to seed mystery so that it incites a path of seeking.

GOODE: Well, we're supposed to have a natural consciousness progression. These giant consciousness jumps are, I don't think, healthy. I think that we're supposed to go through the process. And a part of that process is learning the truth, expanding our consciousness through these new truths. It's a process that we're all supposed to go through.

DAVID: The Law of One also says that the process of mystery that's not fully realized as fact creates the facility of will and faith. And have they ever spoken to you about the importance of will and faith?

GOODE: Well, yes. Will go directly to co-creating and so does faith. They both are important components in co-creating with our co-creative consciousness.

DAVID: So in a sense, this material is withheld from us to inspire our growth, to inspire us to reach out, to seek, to want to figure out how we could be more involved in this world that you're telling us about.

GOODE: Yes, and to have a natural evolution--progression of evolution consciousness-wise.

DAVID: OK. The next question is now with the genetic experiments are being wound down, how do we know that the people here on Earth who are the products of those experiments are not just going to be taken away from Earth and pawned off into other star systems for the experiments to continue elsewhere?

GOODE: Well, it'd be very difficult for them to do with this blockade set up. All of the genetics that are here on the planet are considered human property now. All of the genetics here are ours to do what we wish with.

DAVID: So it's not as if it would be possible as the Super Federation groups leave to take the humans that they tinkered with along with them and just seed them somewhere else. They would be blocked if they tried it.

GOODE: Right. Now one thing that will happen is that the ones that are here incarnated, a lot of them may--we may perceive a large group of people dying. But it'll just be these people going home, back home to their soul group. They were here as a part of the experiment. Now it's time for them to go back so they vacate the bodies.

DAVID: Well, and that could be part of what happens in the solar flash or flashes.

GOODE: Could be.

DAVID: OK the next question is what can people in this community do to start prepping friends or family who have no idea about what is going on? And we're aware of these epic changes that are coming our way. How can we help to prepare people who might not have any knowledge of this yet?

GOODE: Well, this is the perfect time because we're going through what Tear-Eir stated was this Great Awakening. Everyone is starting to stretch their arms, look around, and realize that they were asleep. Now don't go to your friends and families and talk about a message from eight foot tall blue birds or talking about ETs that are crazy looking. What they need to do is approach their family members and begin to seed them with the information about the Secret Space Program, the human technologies that have been developed out--the technologies that are out there but have been kept from us. When it comes to healing us, providing free energy, water desalination, feeding the planet, all of those things are available.

DAVID: So would you also say that the best way to handle this would be to wait for those teachable opportunities when somebody actually asks a question and has a particular interest?

GOODE: You can plant seeds. If you see--if there's something going on in the news and you see they're agitated about it, then you can go in and sprinkle in a little bit of extra information. Did you know that we have other space stations out there that we haven't been told about? You know the triangle craft that we've heard about being a UFO? Those are ours. We're flying to and from space, and people can believe that easier. They're like, oh yeah. OK. And then they start asking, well, what other kind of technologies are they keeping from us? It's that type of expansion. If we go immediately to them about aliens when they've been programmed to reject anything that has to do with aliens, we're not going to get anywhere.

DAVID: Well, let me just run this by you, too. One of the things that I have found works really well is what I call the Rule of 10%. And that is tell people 10% of what you really want to say and then stop and wait for them to respond. How do you feel about that? Because I think a lot of people do the big monologue, and that's really dangerous.

GOODE: Yeah. People--they get lost in the--yeah. Small, easy-to-digest bites is the way to feed people.

DAVID: And then if somebody changes the subject, you don't necessarily want to try to keep pushing it. You wait till they think about and come back later.

GOODE: You plant the seed and walk away.

DAVID: Right. Well, this has been very interesting, and thank you for answering everyone's questions, Corey. And I want to thank you for watching and being so engaged that you send us these questions. We're happy to answer them. This is "Cosmic Disclosure." I'm your host, David Wilcock, here with Corey Goode. And thank you for watching.

Cosmic Disclosure Season 11

Corey Goode, David Wilcock, et al

Cosmic Summit Season 11 Episod 1

Cosmic Disclosure; Cosmic Summit Season 11, Episode 1

DAVID WILCOCK: Welcome to another episode of "Cosmic Disclosure." I'm your host, David Wilcock. And we have a special treat for you--two high-level insiders who have never before spoken in any public or really private forum in the way that we're going to right now. We have Corey Goode and Emery Smith. Emery, welcome to the show.

EMERY SMITH: Hey, Dave, thanks for having me again. Very exciting day.

DAVID: And Corey, thanks for being here.

COREY GOODE: Thank you.

DAVID: So we decided to start out this first episode by trying to find one of the areas where there might be common ground between the things that you've experienced, Emery, and the things that Corey's experienced. And so this gets into the topic of underground bases. So just to start this off, I'm going to ask you some simple questions. And then we'll open it up from there. Are you aware of either the military or the government or whatever you want to call it having underground facilities? And if so, how extensive are they? How many of them are there? And what do you know about those facilities? SMITH: I'm aware of, in just the US alone, about 300 of these facilities. Now, when you say government, I want to, like, talk about that, because it's not always the government that owns these facilities. They guard these facilities, the military does. But they don't always are in control of the facilities, because they are owned by larger corporations and unknown organizations.

GOODE: That have different over--oversight.

SMITH: Exactly.

GOODE: Right.

SMITH: Right.

DAVID: So when you say there's about 300 of these facilities--

SMITH: Just in North America.

DAVID: --that you're aware of, what would be an average benchmark of what you are thinking that that means? What are those facilities? Of the 300, what would they be

like? How big are they? How many people do they hold?

SMITH: Right, there's many different facilities with many different types of populations in them. And they all have a different agenda. And there are some that are larger, like the ones in New Mexico, Nevada, and Colorado, that actually house entire cities. And you never even have to go to the surface. They also have full running hospitals and whatnot for this elite group. As far as the laboratories and all the testing going on there with nuclear and other types of energies--because it's not all just medical, of course, but other things going down there, as Corey can also relate to of working on different types of devices, such as different types of vehicles, number one, space vehicles; also, the medical stuff I talked to you about in last episodes, with all the storing of cloned bodies and whatnot. So there are a lot of these facilities that house many different types of projects. And then there are some that are only for specific types of projects, because it's so compartmentalized, they'll make a whole underground base just for one project.

DAVID: Wow.

SMITH: And they'll keep that with the population usually under about 200 people so they can control them.

GOODE: So Emery, I know you probably can't tell us the names of the bases that you went to or where they were located--maybe some. But can tell us the number and how they were different, as well as what it was like going into the bases?

SMITH: Yeah, sure. Basically, there's around 300 of these bases in the United States, that I'm aware of. Some of the ones I've been to are in El Paso, Texas, under UTEP. Of course, everyone knows about the one I've been in in Los Alamos and Kirtland Air Force Base. Another one would be in Charlottesville, Virginia. There's another one in Denver. Of course, Dulce you know about. And there's one in White Sands--under White Sands National Monument. Also in Crestone, underneath the sand dunes, which they're trying to now expand that.

GOODE: What about in Canada? Are you familiar with any up there?

SMITH: In British Columbia and also near Whidbey Island, off of Washington there.

GOODE: When you approach these bases, or these underground facilities--the entrance to them--are they nondescript? Or are they something that--

SMITH: Yeah, 95% of them are nondescript but also guarded or usually near a base or on a base for the entry points. Now, there are a few that are out there that actually are not guarded. But they're in such remote desolate areas that--I mean, they're guarded. But it's not--

GOODE: With technologies.

SMITH: It's not on a base. Right, with technology and satellites.

GOODE: They're monitored.

SMITH: And completely monitored, exactly. So I think most of them, to answer your question, would be you'd have to enter a really secured lab or a really secured corporation or a really secured military installation to access the underground.

GOODE: So could you take us through what would be typical if you were to go through?

SMITH: Depending on where your entry point is and depending on the type of base it is, some of the most common ones, like the one I was stationed at with Kirtland Air Force Base was basically a fire tower that you would never even think would be the access point.

GOODE: Mm-hm.

SMITH: And a fire tower, meaning it's a concrete base, not made out of metal. So I want you to think of a small 30-by-30-foot building, concrete, that goes up about six floors straight up. But it's there as a fire observation point, which of course, never is utilized for that. And these areas, too, they don't have, like, parking lots in front of them or anything like that. You usually have to walk through many different posts. But since this was already on the base, inside another base that's there--so you're going through two different types of security. So first you have to get on the military base, number one. And then once you do that, there's another even more secure base on there, with the fences and their own security teams. They're not military. And these are private corporations that I spoke of that are running these things. So one of the things I was speaking to Dave about one time was my dorm was so close to there, I would actually ride my bicycle to this place after work. And I was allowed to put my bicycle near the area and then walk over. And this is just an area that people that on base worked there could walk to it. So there's many different places to go in, but for us, since it's more convenient, since we live on the base, for many scientists.

DAVID: What would happen if somebody started to notice an unusual number of people going into a fire tower, like if you were on the base and it wasn't your job? What would happen then?

SMITH: Well, that whole place is monitored, number one. And you're already on a base. And the base already knows there's something--they already know there's something there. They don't know the extent of it, though. The military doesn't always know the extent of how large these underground bases are, which you could probably

attest to.

GOODE: Do they typically bring you through, and scan your body, do all these--I mean, what other types of security measures do they take?

SMITH: So once you get there, like I did, there was actually a bike rack there that I'd put my bike up. And I'd walk right over. And there's just two doors. You walk in. And just like you would walk into the hospital to check in somewhere, they take your driver's license and all that stuff. So there's two security guards there. And you walk in. And they either recognize you, or they don't recognize you. And you do have three different types of security things you have to do before you go in. You have a card, number one. And it's very generic. It's nothing special. It doesn't have any--

GOODE: Just a strip?

SMITH: --Holograms or anything in it. Right, it's just a strip--and a magnetic strip, like you see on a credit card. So it's nothing special at all. Then you have, of course, your palm print identification and your iris eye scan, like the old stuff you see in the movies--very similar to that. So once you go through that and get through all that, then you take the elevator down. Once you get to the bottom--

GOODE: Where they weigh you while you're on the elevator going down.

SMITH: That's right. The elevator is not a regular elevator. It looks like a regular elevator. But the elevator is actually scanning you to see if you have any type of, let's say, plutonium on you or anything that could be a threat. So this elevator's doing a body scan on you as you're going down.

DAVID: Wow.

SMITH: Yeah. So you cannot smuggle something in, in your orifices. You cannot come in there with a bomb or a grenade or a handgun or anything like that.

DAVID: Is it also like a X-ray, MRI kind of thing, where it would--

SMITH: Yes.

DAVID: OK, I thought so.

SMITH: It's a little different like that. It's not radioactive causing, where--of course, they wouldn't do that to you.

DAVID: Right.

SMITH: We do wear these special, of course, X-ray badges the whole time we're in

there, because it monitors how much radiation you have.

GOODE: You're exposed to.

SMITH: Right. And it's not always just from the X-rays. It could be other projects in there that are using stuff that it is emanating at a safe level. But they have to monitor you the whole time.

GOODE: Do they keep a running tally of any exposure you had to radiation--

SMITH: Absolutely.

GOODE: --accumulation?

SMITH: Everyone's monitored for gas and radiation and specific light wavelengths, actually, that could cause damage to the body. So those are the three things they are monitoring all the time.

DAVID: OK, so, Corey, since you've also had experience with underground bases, at this point, is there anything funny that jumps out at you--anything that he said that that was familiar or unfamiliar?

GOODE: Oh yeah, absolutely familiar. And like he said, there's different types of bases. Some of the bases--you cannot access them from the ground whatsoever. You have to go through the tram system--the secret tram system underground. And the only entrance and exit is through that tram system.

DAVID: Right.

GOODE: And often, they will be very deep, as I've said before. At a certain depth, you're no longer considered in United States territory. And so you then have free rein.

SMITH: Absolutely, yeah. And I was getting to that, because once you get down there, you have to take the tram. And many of them have different types of maglev and lavatube devices to get you there.

GOODE: I don't think we've had someone that could give a good description of the tram. I know they have short ones for people that you sit in and you're facing each other.

SMITH: Right.

GOODE: And then they have the larger ones. Can you give a description?

SMITH: Yeah, sure. I spoke about this in the past. And one of the ones is kind of like

a, as Dave and I call it, like a gondola. So when you get down there, there's a chair you sit in. And it goes down a very, very long hallway. And it just keeps going around and around and around. And it's very slow, a little bit faster than you would see at the airport when you stand on the standing conveyor belts.

GOODE: Right.

SMITH: So just a little bit faster than that. And you're sitting down. Or you can stand up. You don't have to sit down. And that takes you to the actual main entrance of the underground base, and it could be as long as a quarter mile. Now, they also have the actual tube system, which is a pod. And it holds up to four people. And it's in the shape of a cylinder egg. And you get in that one. And it has really nice chairs in it, actually, kind of like the reclining ones you would see on a dentist table, but really padded. And you can actually wear a seat belt in these things. But you don't need to. You don't even know you're going because it's so fluid. And it gets up to such a high speed. And I don't know how fast that is. But I heard some of these can go over 500 miles per hour.

GOODE: Yeah, I was hearing over 700.

SMITH: Yeah. So once you get there, whether you're taking the chair, the gondola, or you're taking these maglev tubes--the egg thing--once you get there, then you have to still go through another security checkpoint.

GOODE: Because you could be in another country, for all you know.

SMITH: Right. Or another planet.

GOODE: Right. Exactly. I was actually talking about that recently, about how recently, when I was brought up to the Lunar Operation Command, I was brought into a room for a briefing. And there was a window. And I looked out the window, and I saw Mars.

SMITH: [CHUCKLES] Yes.

GOODE: And I was told that a lot of times, people will take these trams. And much like I took a tram, and it ended up on another planet back when I was much younger, and you can't really tell.

SMITH: Right. You don't.

GOODE: And you can't really tell.

SMITH: Right. You don't go into some hyper jump, or you're even aware of it. It's

that fluid when you do these kind of portal jumps, I'll say. It's in seconds.

GOODE: And they play games with the people when you get there. You'll see windows that make it look like you're on Earth somewhere or on Mars.

SMITH: Right. Yeah, we talked about this. Absolutely.

GOODE: And they were doing that on the moon when I was in there. And they said, ah, and they flipped it over to a moonscape when they saw me staring at Mars kind of confused.

DAVID: Let me also just say for the record that Bob Dean, Pete Peterson, Jacob and Henry Deacon have all reported on this phenomenon of sub-shuttle systems where you get transported somewhere else. And you don't even realize it. You're just riding in the thing, and you go somewhere else. So this is a consistent element of insider testimony that I've heard.

GOODE: Yeah, they could take a scientist, put them in one of the underground trams. They could end up at another facility. And it could be on the moon.

DAVID: Right.

GOODE: And the facilities on the moon, it looks just like Earth facilities.

DAVID: Right.

GOODE: And then walk them around. Let them see out the window--see the Grand Canyon or something. And the people totally believe that they're at a location on Earth.

SMITH: It also helps with the psyche, if you're living underground for a very long time, to have these views and--

GOODE: Yeah, trees and plants.

SMITH: --to have the organic state material, with gardens inside these things.

GOODE: Full-spectrum lighting.

SMITH: And full-spectrum lighting. And the things that we normally have here outside they try to replicate inside. And it seems to lower the stress levels of the scientists and the technicians that are working there.

DAVID: Yeah, let's go with that, because one of the things that Pete Peterson reported to me was this idea that you might have a very large dome underground in which

there is a city, with buildings and roads and trees.

SMITH: Right.

DAVID: And they even have the dome lit so it looks like the sky.

SMITH: Yeah, the dome is really cool.

GOODE: And they do starlight. They do stars at night.

SMITH: They do. And you have your own 24-hour, like you said, the day and night situations. They can make it look like a hurricane's coming, too, with clouds and all sorts of amazing sci-fi effects that are very realistic, as far as the lighting goes and the way it makes you feel like you're looking into infinity.

GOODE: I'm curious. Were any of these spaces that you went to--were they in national parks?

SMITH: Yes. Yeah.

GOODE: Interesting. We've heard tale--and you and I have seen--doors that will just open up out of the side of a mountain.

SMITH: Right.

GOODE: And you could never tell that there was anything there. You could go there with a--do sonic tests. You would never know that there's a door there.

SMITH: You can't even find it with a metal detector.

GOODE: Right.

SMITH: And this is like a giant rock, like you just said, will open up. And it's completely sealed and pressurized, out of the side of a mountain. And we were talking about this earlier, Corey. Even in the desert, like, I always remember watching the desert open up, like you said, which you can explain.

GOODE: Like a zipper.

SMITH: Like a zipper.

GOODE: The ground.

SMITH: And then the sand starts falling in. And I'm always like, man, who's cleaning up all that sand? But they have a special thing that--

GOODE: Yeah, it drains sort of those--

SMITH: Just collects it right out and shoots it back out over the--once the door shuts, shoots it back on top of that. Another type of base that I don't get into too much, up in the North Pole in the polar ice caps, there's bases in polar ice caps.

GOODE: Mmm-hm.

SMITH: And they are magnificently beautiful, number one. And they somehow have their own atmosphere in there, with perfect running water and their own--I'll say their own electricity they make using the Earth, because they're already very, very deep.

GOODE: Are you talking like geothermal?

SMITH: Yes.

GOODE: Right.

SMITH: Yep.

GOODE: And some of them also use the thorium type reactors.

SMITH: Thorium--Absolutely.

GOODE: Yeah. So--

DAVID: I've heard a lot about thorium.

SMITH: That's a big one. Thorium's amazing, yeah.

GOODE: Yeah.

DAVID: It's basically a non-radioactive fusion system.

GOODE: Well, what's interesting is that in a lot of my presentations, I've been showing footage from Project Iceworm. It was a project by the Army Corps of Engineers in I think it was the late '50s, early '60 in Greenland. They went in, and they set up one of these bases. And basically, the same type of building was done down in Antarctica as well. And planes would come and land and provide them the supplies. But this is also how they've built a lot of off-world bases--

SMITH: Right.

GOODE: --this same method. But Project Iceworm was very interesting because later on, the United States tried to smuggle some nuclear weapons there. And the plane

crashed. And everyone found out about this huge base that was secretly built.

DAVID: Just so you guys are aware of this, one of the things that Pete Peterson told me was that the "World Book Encyclopedia"--1953, I think, was the year that the military-industrial complex sent people all over libraries to rip out this one page because it had something in there talking about how thorium could be a reaction that would produce almost no radiation. And he said that if we started to use this, that we would have this incredible breakthrough in technology. So what do you guys know about thorium as it relates to our discussion?

GOODE: Well, I know that in the programs, the research vessel I was assigned to, originally it was nuclear. And then they replaced it with a thorium based. And then they replaced it with some sort of an electromagnetic engine that had these long tubes that they would put something in that they called minnow baskets that would spin. And if you move it up and down, you get a little bit of play in the electromagnetics.

SMITH: Right.

GOODE: And I think it's some sort of electromagnetic friction that's going around. And these leads are picking up the energy and shooting it wirelessly through the tubes, which then go directly to these huge capacitors.

SMITH: Right. Yeah, a lot of capacitors are used in these bases to hold the energy. I'm not an expert at thorium. But I was recently on a project where a private organization--a private corporation--hired me to--they sent out people all over the United States--a scientific team--to find the largest deposit of thorium here in the United States. And I know exactly where that's at. And that is also in New Mexico. I'm not going to tell you the city it's located near. But I'll tell you, it's in New Mexico. And there's an unlimited amount of thorium there that could power all the planets, and all the bases, and of course, us right here indefinitely, I mean with the amount of energy we already currently use.

DAVID: So why do you think, Emery, there would be a base in a national park? What would be the advantage to that?

SMITH: Oh, the advantage of that is, number one, it's completely monitored all the time. You always have park rangers around. So it's like you have your own little civilian operatives out there. And, of course, they're just cluttered with satellites and stuff that are watching them--watching the area, I mean. So these areas also sometimes have a great usage to them because they're near maybe a underground thermal or something. And they're harvesting this energy. Or maybe it has a huge crystalline formation under some of these parks and stuff. So the parks, even in early days, were actually picked out to hide military bases.

GOODE: Yeah, what's interesting is Clifford Mahooty, when we had him here talking, said that reservations--Indian reservations--and these bases and national parks have the same classification with the government.

SMITH: Yes. And that's what I'm saying, because it's limited traffic, or it's controlled traffic. Even on the reservations, like, you're not even allowed to go on a reservation, you understand, unless you have special passes and whatnot with the chiefs. And what happens is that's the perfect ideal place that's never going to have a lot of traffic or a lot of investigation, because we're using an area that we already gave to the American Indians.

GOODE: Right. It was interesting. I read a report that a lot of the groups of park rangers were actually intelligence. They were former military and intelligence, because in a lot of these national parks where people go missing, they end up finding the missing people. And sometimes they had been worked on by non-terrestrials. And they needed to keep it quiet.

SMITH: Sure.

GOODE: So they had the park rangers smooth everything over.

SMITH: Yeah, I can attest and agree to that 100%, that they're using a show of force, or let's just say a security detail, that is not what you would think of someone just graduating college and taking up a job. These people are 20-year-plus veterans either in the projects or in the military, as you said. And they're very overqualified, but they get paid really well.

DAVID: So one thing I'd like to follow up on, Emery, is you mentioned bases under the ice.

SMITH: Yeah.

DAVID: And I would assume this also would include bases in the ocean.

SMITH: Yes.

DAVID: There's this very strange movie that came out 2009 called "GI Joe," which is military. But all the stuff that we're talking about is in that movie all over the place. What do you feel about the movie "GI Joe"? And did you have any--

SMITH: I do recall seeing that. I don't remember it too well. But I do recall seeing it and connecting the dots, we'll say. And I think there was a lot to it at the time. I remember watching it and saying, wow, here they are, just coming blatantly out.

DAVID: Because it's so--

SMITH: --and showing--

DAVID: They're doing these beautiful visuals in the movie with computer animation.

GOODE: Oh, yeah, well, especially the second one, when they did the rods from God attacks--

DAVID: Oh, that was crazy.

GOODE: --on the Earth when that's exactly what we're looking at in the North Korea thing.

SMITH: Right. Right, interesting. I didn't see the second one.

DAVID: The telephone-pole-sized pieces of tungsten that you can drop onto the Earth. And just gravity causes a very, very severe explosion that can devastate a huge amount of space.

SMITH: Oh, yes.

DAVID: And he had talked about that. And I only watched the second "GI Joe" film recently. And I couldn't believe that it was in there.

SMITH: Wow. Yeah, that's pretty amazing for them to blatantly come out and expose that classified information. But we do start to see that now all the time with the movies are giving tidbits. There's the Alliance and other white hats that get to throw a couple of messages in there, for those who are paying attention--

DAVID: Right.

SMITH: --and talk about it. So I think it's a great thing.

DAVID: So another thing I'd want to bring up now is when I spoke to Bob Dean, retired Major Bob Dean, he actually told me a lot more than he ever said publicly with Project Camelot or anyone else about what he really had been involved in. It's very similar to what Corey's done. And one of the things he talked about was an island in the South Pacific that looks like an island if you fly over it. But if you get really close, half of the island is some kind of hologram. And it's camouflaged. And you can go through that hologram. And then you find out there's a whole base there that you can't see from the sky. Are you familiar with anything like that?

SMITH: There's lots of that.

GOODE: Yeah, lots of that technology--

SMITH: Lots of it.

DAVID: --the masking technology, with holograms. They've even developed holograms to a point to where they have mass. Or they call them hard light, to where they can--

SMITH: You can cast a shadow.

GOODE: Yeah, you can do a hologram. And you can walk up and tink, tink, tink, like a piece of glass. Or even they can make it even thicker in depth.

DAVID: Wow.

SMITH: Yeah, I totally can attest to that as well. And I was part of that. But there was compartmentalized projects near me during that, that were working on satellites that could do that, or they were putting that technology in satellites in the early '90s, and I think it was probably before that.

GOODE: What's crazy is they'll have a hard light panel. They remove the source of the power or electricity, and it stays.

SMITH: Right.

GOODE: I mean, it's incredible.

SMITH: Yeah, they're using all sorts of cool technology. That's why I always say, if I did see something--a craft or whatnot, an ET--it's hard for me to say, oh, that's real, or it's not real unless I actually was right in front of it and analyzing it, because they can make you really believe you saw a plane crash into a building.

DAVID: Mm-hm.

SMITH: They can make you really believe that's really something there. And you can get up to it, like Corey said, and it's palpable.

DAVID: Really?

SMITH: It is actually palpable. And the ones I've seen were not as palpable as yours were. You're like--mine was just for a little bit. And then you could just easily go through it.

GOODE: Right.

SMITH: But that's just an amazing technology to begin with, because then you can basically make any type of threat--fake threat--or use it for horrible situations where you're trying to--

GOODE: They're using it for building.

SMITH: Yeah.

DAVID: Would they create areas where, like, NOAA would have a no-fly zone? So, like, you couldn't fly a passenger plane or a airliner over these areas?

SMITH: Oh, that's right now. Right now they have it everywhere. There are certain places you can't--no-fly zones. And that's a great way to also investigate when you're trying to find places. And you're like, well, why is it way over here? This is a no-fly zone.

DAVID: But, like, if you have a little Cessna, what would happen if you tried to go towards one of these zones, let's say?

SMITH: You immediately would be escorted out by some F-16s or F-15s or whatnot.

DAVID: OK, it seems pretty strange that they could have this hard-light technology or a hologram cloaking something. Somebody at some point is going to find it. Somebody's going to be sailing in a little skiff--

SMITH: They have.

DAVID: --on the ocean or something. So what would happen in those situations?

SMITH: They have, and they were terminated.

DAVID: Really?

SMITH: Missing at sea. Or even in military operations, sometimes they accidentally stumble.

GOODE: Training operation.

SMITH: Right, and they're not supposed to be there. But they are. And they are usually terminated.

GOODE: Dead in a training operation or something like that.

SMITH: Yeah, they were, like you just said, people that work at these bases, too, their families don't know that they're going to a base to work for three months. They're just

saying, I can't contact you for three months, because I'm going on a mission. So when they do die, and they tell the family, oh, they died in action or on a training mission, it's completely false. It's completely fake. And they'll never know, because the best people to hire are military people that are active duty, because they're very expendable.

DAVID: What other methods do they have to protect the base from people showing up so that they don't actually have to kill people? What are some of the other methods? Because I would hope they don't always do fatalities.

GOODE: You know, they'll do things like put out signs stating that there's radiation, that this was a testing zone for nuclear weapons, and try to deter you that way.

SMITH: Well, they have many things in place to deter you from going there. But sometimes it just happens. You can't have a sign every 50 feet when you're 100 nautical miles out with this island and stuff. But there are boats that are always and aircraft that are always patrolling those areas. And the satellite that are assigned to these bases, they're always there. And a fleet can't even get in there without them knowing that there's something in the airspace.

DAVID: Wow.

SMITH: You could not fly under radar to these places. You will be caught. You will be found.

DAVID: Do you think there are certain cases where people would be brought into the base and become employees or maybe unwillingly become employees instead of just being shot?

SMITH: I'm not aware of that.

GOODE: I am, unfortunately.

SMITH: Yeah?

GOODE: Yeah. There have been, for the biometric testing and stuff, they'll take people.

SMITH: Oh, for testing, right.

GOODE: Yeah.

SMITH: Yeah, I've seen them get kidnapped. And people were there against their will but not to be working for someone. I've never seen that. But absolutely what Corey

just said is unfortunately true.

GOODE: Did you ever hear of any security measures to protect against psychic spying or remote viewing?

SMITH: Absolutely. All the bases have dedicated remote viewers on board. And don't forget, remote viewers don't have to be on the base.

GOODE: Yeah.

SMITH: They could be far away and still protecting the bases. And you get two good remote viewers--and that's one of my specialties that I actually get paid for--is you have a remote viewer, let's say, that's 90% effective. And then you got another remote viewer that's, like, 90% effective. And they both come up with the exact same thing. So you only need a few of those guys on board to check out surveillance. Now, they do have people that are advanced remote viewers that are using--

GOODE: Remote influencers.

SMITH: Right. Say it again?

GOODE: Remote influencers.

SMITH: Right, remote influencers that also use consciousness-assisted technology and electronics that they hook up to.

GOODE: Have you seen some of the--

SMITH: Yes.

GOODE: Yeah, there's either a pole or a plate that they put their palms on.

SMITH: Two gold plates or--

GOODE: Well, one is copper. And one looks like it's a stainless looking steel. And it's hooked up to wires. And they'll sit there. And it enhances their ability. The remote viewers that try to view military bases, they'll begin to see a view of the base. And then all of a sudden, their thoughts are scattered. And they were being called in the smart glass pads, which it's an awkward way to label them, but they called them those that scatter, because they were scattering the thoughts of anyone coming in. And they were also sending energetic feedback through the connection and giving people what they called ethereal headaches, which for days you have a huge headache. And I'm sure you know what that's--

SMITH: Oh, yes.

GOODE: --what those are.

DAVID: All right, well, that's very amazing stuff. And that's all the time we have in this episode with Emery Smith, Corey Goode, and myself. We'll see you next time. Thanks for watching.

Disrupting Disclosure Strategies Season 11, Episode 2

Cosmic Disclosure; Disrupting Disclosure Strategies Season 11, Episode 2

DAVID WILCOCK: Welcome to another episode of "Cosmic Disclosure." I'm your host, David Wilcock. And we are here with Emery Smith and Corey Goode, truly a roundtable of insiders' insiders, giving you cutting edge glimpses of a world that most people have no idea about. So Emery, welcome back to the show.

EMERY SMITH: Thank you, Dave.

DAVID: And Corey, welcome back.

COREY GOODE: Thank you.

DAVID: So we're going to start off with a question from the audience. And this is a question for both of you. And the question is, do either of you have any regrets about coming forward?

SMITH: I don't have any regrets. I mean, I look back--of course, when certain things happened, certain traumatic events, I'll go in that mode for maybe an hour or two, like what am I doing know? I'm going to end up dead or something.

DAVID: Yeah.

SMITH: But in the grand scheme of things, when I look back on everything, I just cannot even believe I'm still here, number one. And number two, I get to tell everybody about it. And number three, I actually enjoyed doing all this stuff and experiencing all these amazing things. And I appreciate that. And I'm compassionate about all the stuff that I've been through and the things that I have done, for not just me but also the people I was involved with and also the beings that I was involved with. And it was very rewarding, actually. So I think of a bigger picture moving forward. And I want to make a big difference for everyone. And I want to help everyone and help the planet get to a state where it's at a great level of consciousness so we can advance into space and into other realms.

DAVID: Well, but like the rest of us, you've had some very harsh threats.

SMITH: Very.

DAVID: And I think a lot of whistle-blowers--you know, we talked about the idea of if they wanted to kill you, they would have killed you.

SMITH: Right.

DAVID: Right? So they didn't actually want to kill you

SMITH: Absolutely. No.

DAVID: But what has happened to you may have been intended in part to try to intimidate other whistle-blowers so they wouldn't come forward.

SMITH: Oh, of course. That's the whole intention is to install fear through me speaking to you about incidents that have happened. And like I said, if they really want you dead, you're going to be dead. And I'm still here.

DAVID: Right.

SMITH: Knock on wood. So I think it's more of an intimidation factor. Also, they want to cripple you so you won't talk. They want to make sure I don't get here.

DAVID: Right.

SMITH: And you've seen what I've been through just in the last two weeks trying to get here.

DAVID: Absolutely.

SMITH: So it's a very dynamic thing that they have going on. And they're very precise on how they do it, and that they don't go too far, because it takes a lot of people to vote on someone being terminated, I'll say.

DAVID: Right. Corey, any regrets about coming forward?

GOODE: You know, mostly in the beginning, I did have some regrets. I had a good career that pretty much was destroyed. But having two children and a family while having helicopters buzz your house, as happened, having laser dots on your chest while you're standing next to your son, I've had my share of threats. Now I see the big picture. But in the beginning, I had a lot of regrets for coming out or for being brought out. I had regrets for how I was brought out as well, because I didn't have much choice in the matter.

DAVID: Right.

GOODE: But if I had been given the opportunity to come out on my own, I'm sure I would feel a lot better about the beginning portion. But now I see the big picture that Emery just discussed.

DAVID: So let's get back to the topic that we were on last time we're going to continue with. And that is the subject of underground bases. We had started to talk in

the previous episode about these solid holograms. And you had said, Emery, that they are projected out of satellites. So is this at all related to Project Blue Beam, or is it something else? How would that work?

SMITH: Yeah. I think it's separate from that now. That was an older project. And now they have a more advanced type of satellite, where it actually uses multiple satellites to do it, sometimes not just one satellite that can project. They might use up to nine satellites to do a projection.

GOODE: Project a grid

SMITH: Yes.

GOODE: Out over an area, an operational grid.

SMITH: Absolutely. And they can also set this up on the ground, using giant cargo containers and trucks, and do the same thing on a terrestrial basis, on the land. But most of it's done through satellite technology.

GOODE: I agree. A lot of it's done with satellite technology. But some of it has to be done from the ground to give it the full--each layer of the depth that it needs to make it believable.

SMITH: Exactly. Yes.

DAVID: So what do you think is going on with it being able to make a solid surface? How would that be possible? Is it like--

SMITH: I mean, I'm just hypothesizing here. I don't know the science behind it. Somehow, they are able to change the mass of the atoms in the air and use moisture as well, vapor of some sort. Some say it's glycerin-based. I don't know. They might draw up--a couple of planes might fly over and spray this stuff. And then next thing, you have a really good--let's say you have a really good background to project this film onto. So I think it has to do with that, rearranging the molecules and atoms somehow into a denser state, where you have this palpable type of mass. And like I said, I didn't get to see like the hard one that Corey has seen. But I have touched the ones that are just very palpable. It feels like I'm touching a memory foam mattress, that kind of--it pushes back. But then if you really try to push through it, you will go through it.

GOODE: This other technology worked on some sort of electromagnetically locked--it goes back to whatever moisture--they're able to--I guess kind of like when you go to an MRI, it makes all of the metals in your body go to one side, to where they can view it. It does something similar. It turns everything--all of the molecules into one direction, I believe.

SMITH: Right.

GOODE: And then it magnetically locks them.

SMITH: That's right. Yeah.

DAVID: Hmm. So given what you said, Emery, would it be possible that they would like let's say spray an aerosol, and then that hardens into sort of like if you put chocolate on ice cream or something?

SMITH: No. No It's still floating in the air. You can't see it. I mean, it's very small nanoparticulate matter, made up of--I don't know the actual ingredients and concoction. I just threw out glycerin and water because I heard on the earlier projects that they were doing inside the lab, projecting stuff onto this steam and film.

GOODE: Ah, like the solid smoke.

SMITH: Yes.

GOODE: Right.

SMITH: Yeah.

DAVID: Hmm. Never heard of that.

SMITH: But it wasn't, as you say, a Magic Shell topping on the vanilla ice cream. But it's more like it's in the air. And you notice that it's not as clear as it usually is. And--

GOODE: It's particulate.

SMITH: It's very particulate, yeah. So it's floating around.

DAVID: Now, we had been talking about remote viewers being used. And I think that's a subject that we kind of rushed through right at the end of the last episode.

SMITH: Oh, right.

DAVID: So let's talk about that a little bit more. Now, you said that one of the things that we were looking at about these underground bases concerns something that you guys--I think, Corey, you mentioned the term "delta waving." So why don't you bring that up, Corey, about what is delta waving and how does that relate to people working in these underground bases?

GOODE: Well, I mean, it was developed in underground bases. But those are used more for when they go into a neighborhood and they went to abduct someone. They

delta wave or create delta wave patterns in all of the people around, causing them to go into a deep sleep, to where they can't observe what's going on. More of what kind of applies to the deep underground bases is that you have thousands and thousands of people going to work every day. They know that they're doing something very important, but when they come home, they either have no idea what they did all day or they have a screen memory of what they did, because they're blank-slated at the end of every shift.

SMITH: Yeah. As you walk out, they blank-slate you. And--

DAVID: How did that work for you when you had that done?

SMITH: I didn't have that done. That wasn't used in my compartments ever. And my security clearance was pretty good as I got escalated so quickly in there, plus I had a really good standing record. I never really messed up except for maybe one or two times, which is not a lot in these projects. People are constantly messing up and making mistakes. One thing that I do know is that in the projects they do it also to military people. And when we go on missions, whether it's to look at craft or extraterrestrials or go through portals or time change things, some people come back and they have some serious PTSD. And if you can't get rid of that in a week or two, then they will do this as well to you.

GOODE: Yeah. But the unusual thing is that it doesn't get rid of their PTSD.

SMITH: No, it doesn't.

GOODE: What will happen is that people will have unexplained PTSD. And they'll have multiple types. They'll have combat-related. They'll have complex. And those types of things are--they usually only happen to people that were in war and involved in serious abuse.

SMITH: Yes. I know high echelon military officials who ran large flights and platoons and many different types of defensive and offensive type missions. And I know some colonels and generals who've been mind-erased at least 20 to 30 times, because it's just too--it's too much. They go through too much, holding onto--losing many cadets and soldiers. And it does take a huge impact on these people, and all the way down to the person on the front line, or as we say on expeditions, the people at the front of the expedition, who during when you're going to an area that you're not aware of what you're about to expect with a craft and extraterrestrials--and people get hurt because they walk in there too quick.

GOODE: So about what year was the last year you remember being in one of these facilities to where blank-slating was going on?

SMITH: 1993.

GOODE: '93. And do you happen to know the method of blank-slating that they were using?

SMITH: No. I know about this because there were certain compartments that had to go--when they left, they had to go through this airport-type device. And that's what they said. And everyone kind of knew, though. Everyone thought they were just looking inside their bodies and whatnot. But it actually was doing what you said. It was erasing their memory or putting them to sleep. It was affecting their brain wave pattern for sure that they would not go home and be worried about what they did today. They would really just rather go home and just call it a night and go to bed. So it was affecting them in the brain that way.

DAVID: When you say airport-type device, are you saying like a metal detector or body scanner?

SMITH: Like a body scanner.

DAVID: Would they fall and pass out, or how would it--

SMITH: Oh, no. No. I'm saying that it's reprogramming your brain, like make-believe you just got a whole--did a whole 12-hour shift. Now you're leaving. And as you walk through these things, you can't really recall exactly what you worked on today and you really just want to go home and rest. You're not thinking about going out and partying. You're not thinking about going to the grocery store. So a lot of people complained about this, because some people forgot to pick up their children at the nurseries and stuff. So they had to tone this thing down and perfect it, because back then it wasn't really that perfected.

GOODE: And that definitely sounds like a mechanical way, technological way of doing instead of the chemical.

SMITH: Yes, it was.

DAVID: Given this technology exists now, how many people do you think might be in the military and unaware that they're doing something this exotic? Like how many people might be walking around without a clue?

SMITH: They know what they do. They just can't recall what they did. And they're OK with it, because when they get back the next day--don't forget, you remember everything when you're back in there. And then you're OK until the end of the day. So it's not like it's like a forever thing, because as soon as you walk back in there, everything is OK again. Everything comes right back.

GOODE: Because they give you a cue when you walk in the door. There's a specific sign or a specific cue. When you walk in the door it tells your brain to remember.

SMITH: That's right. And they've done it with sound and symbols on the walls and to the hallways and the stuff is what I've learned from experience and what I've learned from what they're doing right now is that.

DAVID: Let me just throw this in. One of the things that is very, very frustrating for me when I talk to Pete Peterson, which I do two or the three times a week for two hours on the phone usually, whenever we really get into the good stuff, he just immediately starts passing out. He starts falling asleep. He'll trail off in the middle of a sentence and I'll literally hear snoring. Hang in with me, Pete. Stay awake, buddy.

PETE PETERSON: I am. I'm listening.

SMITH: Perfect example.

GOODE: Program trigger.

SMITH: Perfect example.

DAVID: So what do you think that is? What's going on there?

GOODE: That is more of a hypnotic thing that's been programmed into him. That's a long--it's a little bit more involved of a process. But you can be programmed to have a seizure when you're accessing memories, to fall asleep. There are a number of things they can program you to do.

SMITH: And certain words and frequencies--like I want to tell you something about Project Backscape, I can't, because soon as I think about that, it shuts down. I can't even say it.

GOODE: Or you start stammering or you--

SMITH: You'll start stuttering.

GOODE: Right.

SMITH: I've seen this many, many times. And you will sometimes go unconscious or have seizures or whatnot. So this is a really good program. I'm not sure how they exactly do it. I think it has to do with the same type of technology that they use to wipe your memory clean and whatnot. And I know it's the same stuff they use on the PLFs and clones.

DAVID: If you're going to remember everything as soon as you go back to work, does

that mean, based on your experience, Emery--and then Corey, you can get your opinion on this too. Does that mean these people are basically in for life? Do they continue working their whole life?

SMITH: Oh. The majority of these people, for sure, when they take this job, they know that this is going to be a lifelong thing. I mean, with all the NDAs you have to sign and all the threats you get and all the little things they do, you're here because you really want this job.

GOODE: And they make it very difficult to obtain or hard to earn to get the job. I mean, the security clearance on its own, all of the other hurdles they make you jump, you covet the job and you don't want to do anything to lose it.

DAVID: So what are some of the kind of mistakes that people could make that--you mentioned that you could make a mistake and get in trouble. What are some of those kind of mistakes? What could happen?

SMITH: Well, going into the wrong area, number one, happens a lot. And that is a very bad mistake, could be fatal if you walk down a hallway you're not supposed to be down or enter a room you're not supposed to be in, as you're being tracked through the whole facility every second. Another one is people try to take things out of there, little trinkets and little things that should not be on the surface. And that's instant death.

DAVID: Really?

SMITH: That's instant termination if you get caught actually beyond security with something like that or if you just made it through security. It shows that you already had the intention to do that and you had to go through great--just a huge expense, huge planning to even do something like that, because--

GOODE: It doesn't happen by accident.

SMITH: It does not happen by accident, because you know they can see through your body. You know they know everything. They hear everything, see everything. While you're in there, there is no private place anywhere. And you are always tracked. And you are always reminded. And they do little tactics every now and then with different colored lights and warnings and sounds and different sirens and beeps to just remind you, hey, maybe something just happened, maybe it didn't. Maybe they just did that to up your games, or you better--So it's kind of that kind of environment. But it's also a very lax environment amongst the scientists and the physicians that are in there, that are doing all this stuff. And there is some play and some joking going on. Yeah. So that's kind of the two biggest things is going somewhere you're not supposed to go, and number two, bringing something in you're not supposed to bring in, smuggling it in, or bringing something out you're not supposed to bring out.

DAVID: Is everyone aware of that they would die if they--

SMITH: Yes. Everyone knows it's a huge risk to your life or your family's life. So if you're really good and you screw up and they still need you, they'll just take out your daughter or son or something.

DAVID: Oh, wow.

SMITH: I didn't have a daughter or son, so they took out my dogs. So it's like--it gets to this point where you've got to be really wanting to do this and also be loyal to what you're doing. And then you'll go really far.

DAVID: All right. Well, let's talk about what are some of the programs that are occurring in these bases. And specifically, you have mentioned in the past some genetic experimentation that you personally witnessed and that was sort of like your specialty. So could you cover that for us again now that we have Corey here? Just give us an overview of what types of genetic programs were you aware of being conducted in underground bases.

SMITH: OK. Sure. Some of the genetic programs that I was aware of while I was there was the hybridization of humans and other life. And it could be animals, mammals, insects, plant life, all sorts of things like that, and trying to see where the consciousness goes with that with the two different types of material. And they were very successful. And they've been doing this overseas for a very long time. And we started pretty late here in the United States. But now we are the leader of that, but not United States. I'm saying the labs here, because when I say the labs are all the same, it's just the newest ones are here.

GOODE: Well, actually, this has been going on by us, maybe not in our territory, much longer. For instance, there is what they described as on paper was an NBC based, Nuclear Biological Chemical testing base in Mexico, owned by the United States. It's in the area they call the Zone of Silence. And it turns out that this NBC base is actually--it's actually been a genetic experiment type base. And it's been going on for quite a while, much longer than we've been working on in the States.

SMITH: Exactly. Yeah. Definitely. I agree with that 100%. Right now--so the experiments that are going down there are also cloning of many different types of species, including humans, and the making of clones and program life forms, which could be any type of life form that they grow there. And that is infused with a type of consciousness or infused with a type of circuitry on a nano level for complete mind control.

GOODE: And they can also use them as avatars. They can push the consciousness of a soldier in using an electromagnetic field that pushes--but the avatar has to be

genetically compatible with the frequency--with the frequency of their body's genetics for them to be able to use.

SMITH: Yeah. Similar to the movie "Avatar" where you see that, that's a very realistic rendition of some of the things that they're experimenting with right now.

GOODE: Yeah. That's been going on a while.

SMITH: And they can--you could do many jumps like that as well into different bodies. It's a very high-tech, high classified place that they do this in. I've only--I only know of maybe two places, two specialty labs that are involved with that. And there might be, of course, more.

GOODE: Yeah. What was interesting is on the research vessel I was on, they were using this type of technology to transfer scientists and operators from their bodies there on the ship to pass them on to these avatar-type bodies that were off in ships in other star systems.

SMITH: Absolutely. This is so true. I'm so glad you brought this up. I probably would never have talked about it. And what I have witnessed is them doing that here and then putting it into a body like in New Zealand or Australia.

GOODE: Right.

SMITH: And so we're talking like Bluetooth gone wild here, of taking someone's consciousness and like shooting it actually through the Earth to this other part of the planet and infusing--

DAVID: If that body gets injured, do you feel the pain with your own body?

GOODE: Yes.

SMITH: Oh, absolutely.

GOODE: And they're broadcasting their consciousness through the cosmic web, the same portal system that they use for travel.

DAVID: Are you aware of your physical body, or--

SMITH: Yes. It's just like--

DAVID: So it's like bilocation?

SMITH: It's just no different than if you were to be in my body, you would know everything about me as far as the physical everything. And if I was in you, I would

be--

DAVID: No. I guess what I'm saying is if you're in a chair and you're in an avatar somewhere else--

GOODE: You don't have a bilocal--

DAVID: Are you aware of the chair?

SMITH: Oh, no. It's not bilocal.

GOODE: No.

SMITH: Yeah.

DAVID: Oh, OK.

SMITH: This is just complete--your transformation of consciousness goes from this body to in a totally different body. So this body now is just a cold slate. It's just sitting here. It could be put in suspended animation. I've seen that done. A lot of times these jumpers--we call them jumpers--that do this all the time, actually they might just dispose of that body and keep going. And that messes things up, by the way.

GOODE: It does. There's a type of portal that works that way. They call it the Xerox room, where people go in and an exact duplicate is sent at another location. It's created.

SMITH: Oh, bilocating.

GOODE: And as a part of the process, this one is destroyed.

SMITH: Right.

GOODE: There's like--after they say, yes, they have arrived safely at this location, a signal goes back that automatically vaporizes the being on this side.

SMITH: Right. Wow. That's pretty intense. I know that by killing the body that you left on an astral, spiritual, and conscious level, you're not--you're separated from your old body. But you still have these harmonics and frequencies of that body still in that body. So there's a piece of you still there.

GOODE: It's also like making many copies of the same file. You start to--there's degradation that occurs.

SMITH: Yes. Exactly. And that's the same thing happens in growing cells and

regeneration. You keep losing--when you're doing it in a Petri dish compared to someone's body, you always lose a little bit of that cellular integrity.

DAVID: Sometimes I think, Emery, pop culture references like in popular movies can become almost ingrained belief systems.

SMITH: Sure.

DAVID: It could be very hard to unwind. And I remember when I watched "The Matrix," it didn't sit right with me. I know they were trying to create jeopardy, but you remember the scene where Keanu goes, "if you die in The Matrix, do you die here?"

SMITH: Right.

DAVID: And then Morpheus goes, "the body cannot live without the mind."

SMITH: Right.

DAVID: And I'm like thinking, wait a minute. If you die in The Matrix, that's just your electronic form. Your body is still in the chair. So--

GOODE: Well, it goes back to also--what is it? What the mind perceives, the body believes?

SMITH: Right.

GOODE: When the mind believes it has died, the body goes through a process.

DAVID: Really?

GOODE: Yeah.

SMITH: Right. So you have to have a really strong mind to be part of these projects. And they go through very strict special diets with neurotropic enhancers and they have to be really physically fit to do this. And so there's a lot of variables in being one of these people. But the mind, like you said, makes it real. And so it's more of a belief system and a connection system that you have with your astral and all the light bodies that you could mention. It's about having a good connection with that and being able to tell what's real and what's not real, because there are some people that never come back because they forget and they get trapped in these states of programs and these other states of--it might go wrong. And they just might end up walking away and forgetting where they really came from and start a new life somewhere.

GOODE: Makes you wonder if something like that happens through reincarnation.

SMITH: It does.

DAVID: It's almost like they hijacked the reincarnation system in a sense by doing this.

SMITH: Yes. Yes.

DAVID: All right. Let's talk a little bit about cloning again. One of the things that immediately pops up in my mind is if they need workers underground and you say there's this cloning program, then how many workers might actually be clones when you get into these vast underground cities?

SMITH: It's cheaper to hire someone from the surface.

DAVID: Oh, it's cheaper.

GOODE: You want--clones are good for certain things. But you need actual experience. Like a clone hasn't picked something up and set it down 1,000 times in its lifetime. It hasn't gone through hurting itself and all the different things that we go through to learn experience. And also, a lot of the--I told you once that when we were brought to a facility on Mars that some of the equipment that was delivered with us, four guys came out, looked identical to their selves. In their eyes, there was--they were almost like automatons. There was no real warmth or life in their eyes. They came and they picked up the equipment and off they went in lockstep with each other. So this type of cloning is done and used in many different programs. But the usefulness of a clone is limited. You want to have a person with experience that has--especially a scientist. You don't just want to clone a scientist, you want a scientist that's gone through the schooling, has been through all of the testing, the failures, the successes to make them who they are.

DAVID: How does this equate with what you have seen?

SMITH: Yeah. Absolutely. Clones go through a progressive education enhancement program. And what that does is you do have to teach them. You can only program them for so much. But they need to have just regular quirks about them. They have to socialize.

GOODE: You can program how to tie a shoe in their head. But until they get the muscle memory down from doing it over and over, it's disconnected.

SMITH: Right. So if you're really sending this clone out to--I mean, you want to know about it, you're sending it to the surface. It's going to go through some serious training way before all that happens. But yeah, I agree with what Corey said. And I've seen--it sounds more like program life forms to me, because of the eyes.

GOODE: Yeah. I mean, many program life forms are clones. That's just the level at which they are programmed.

SMITH: Right. I'm talking--when I say the word "PLF," though, in a definition, I'm talking about something that was grown, that's kind of organic and cybernetic.

GOODE: Gotcha.

SMITH: So I know you have a different definition. I definitely believe so. But that's what I mean when I say PLF. And then there's the clones, which can be programmed, like you said, exactly like you said. And they can do all these other things. But they're completely organic. There's only--except for if they have circuitry or nanoparticles in them that are for whatever, that could be made of metal or whatnot.

GOODE: Yeah. I've seen some weird stuff that they put in them, looks like fiber optics with two different pieces that they put up in their heads, surgeries.

SMITH: Sure. Interesting. Yeah. I've seen similar pieces of equipment, I'll say, kind of embedded into the bodies like this with a couple hoses and wires and stuff, but don't think of the cheap hoses and wires, very bioluminescent-type stuff that has definitely a specific function.

GOODE: So an article came out just very recently that was talking about all of the military personnel and scientists that wear Fitbits, you know the watches that monitor your health.

SMITH: Oh, yes. They are. Sure.

GOODE: Well they have GPS tagging with them. And it appears that no one turned off the GPS tagging when people were working in these special access programs.

SMITH: Right.

GOODE: So recently the map was released of where all these little pings were coming from. And they were revealing secret bases. One area was down close to the Ross Ice Shelf down in Antarctica, right in the area where I had been brought previously and saw an underground base system that was under the ice. So have you heard of any of these places, such as Antarctica, having some bases?

SMITH: Oh, definitely Antarctica has a base there and there's some crashed craft there. And there's an ancient civilization that they discovered there. And they're building the story for that to release to us soon, in the next couple of years. But first, they've got to get all their ducks in a row. And they have to, of course, go through this base and they also have to go through the crafts. They have to go through the ancient

ruins that are there and put something together that's a good story that we're all going to believe.

GOODE: Well, it's already starting to happen.

SMITH: Yes.

GOODE: If you remember, months ago, not too long ago, that we had a university that stated we have geothermal pockets under the ice where there's life. There's flora, fauna. There's all types of genetic diversity occurring. So we're getting little bitty drips here and there. So I think that we should keep an eye on what's going on in Antarctica for sure.

SMITH: The biggest hotspot and the biggest thing everyone is talking about right now. And I can also back you up as saying there are many of these--because using this backscattered radar technology that I was involved with, you can see large openings, large spheric openings in the earth and Earth's crust and even down near the mantle there, that are hosting their own atmosphere and pressure, life, and all sorts of things. And now getting back to Antarctica, the great thing about Antarctica, as I told Dave before, is they're all like, well, when, is that going to be--who's going to be the one to come forward on Antarctica? And I said, it's Gaia. The Earth is slowly melting that away right now. And no human is going to have to come forward, because another year or two, that craft is going to be shown all the way--

GOODE: We're helping the situation along because of the excavations we're doing with steam excavations. What I was told is that the high-pressure steam, dropping of bags and hitting them with microwaves to clear out large areas, is causing major ice melt that's going underneath the ice shelf and further lubricating it and causing it to break apart at a much faster speed than it would have previously. A lot of what's occurring is geothermic activity, because the base that I saw had a giant tower that was a geothermic generator.

SMITH: Right.

DAVID: All right. Well, that's really fascinating stuff. That's all the time we have in this episode of "Cosmic Disclosure," with Emery Smith, Corey Goode, and me, your host, David Wilcock. Thanks for watching.

Aliens and Vaccines Season 11, Episode 3

Cosmic Disclosure; Aliens and Vaccines Season 11, Episode 3

06 Jun 2018

David Wilcock: Welcome back to "Cosmic Disclosure". I'm your host, David Wilcock, here with Emery Smith and Corey Goode.

So, Emery, welcome back.

Emery Smith: Thank you, Dave.

David: And, Corey, welcome back to the show.

Corey Goode: Thank you.

David: So I thought that we would open this one out . . . we're going to be talking about xenobiology and some really interesting things having to do with the pharmaceutical aspects of that.

This is a story that is very strange.

So since 2000, I've been in contact with an insider who calls himself Walter Storch, among other names. And he has a website called TBRNews.org.

And he has a book on there with his conversations with a CIA insider named Robert Crowley. So the book is called, "Conversations with the Crow", because in the CIA he was called "The Crow".

Emery: Right.

David: Most of the stuff is pretty conventional-sounding insider politics, but then there's a really weird story about the CIA being called in after a woman got hit by a car.

And she gets brought to the hospital, and they put her body in the gurney in the hospital.

And they come back and they lift off the covering on the body, and it has turned into some kind of gel. It's like melted, basically, mushed out.

And the CIA was the first to be called, and they're doing an investigation, and then – he says in the book – Air Force personnel came in, said that the CIA did not have

jurisdiction, kicked them out, took the material and left.

And it's just this odd thing, and they don't even believe in extraterrestrials, but they're like, “This is not a regular person”.

Emery: AMAZING!

David: Yes!

Emery: And you know I know the answer to that.

David: Right.

Emery: It's just an amazing story, Dave. Thanks for sharing it with us.

You never even told me that story . . .

David: I know.

Emery: . . . so I'm really hyped now about how to . . .

David: Yeah!

Emery: . . . explain this jello. So what happens is this. While working in those projects in the underground labs, doing autopsies and working on these foreign tissues and extraterrestrial tissues and whatnot, some of the tissues they learned way before I got there – 20 to 30 years before I got there – they had a problem.

One of the doctors was working on an arm, actually. And after he worked on it, he put it in a bin, went in to storage for about four or five days.

They went to go back and get it and it was all goo. It was all gel – jello – just kind of disintegrated.

So this started happening on a consistent basis with extraterrestrials that were interdimensional, that could shapeshift, that were MUCH MORE advanced than regular extraterrestrials. So think like over 100 million years old for the advanced ones.

David: Hm.

Emery: And everything below that is just kind of a regular extraterrestrials. No offense. Ha, ha.

David: Ha, ha.

Emery: But they're still amazing. No, what I'm getting at is: it was a frequency problem going on where the extraterrestrials that are of this advanced state have a defense mechanism like our white blood cells fight viruses.

And this defense mechanism will not allow a human to acquire the genetic DNA of these beings, because we would probably use it for bad . . . for something not good.

So encoded in their DNA and into their genetic frequency is this program.

So if I were to go up to this being to try to operate [on] it, even fully gowned in a spacesuit, it would basically turn to gel because my frequency does not match it's frequency.

Even though it's dead, it still has frequency, which Corey can attest to. These beings can hold that up to 30 days to a year.

Corey: Right. Basically, their DNA is putting off a frequency while they're living that may be holding the molecules together even.

Emery: Right. And that energy signature will also stay there in the area, as you know through the morphogenetic field, reading these studies, testing of these energies that people have laid in bed and died, and their energy markers are still there.

So this is kind of what has been going on when you hear about, you know, these bodies being found and they turn to jello and whatnot.

So what they did is: they started inoculating a lot of the physicians there and a lot of the technicians that were working on these bodies with, believe it or not, alien DNA.

David: Really?

Emery: And when . . . It was a very small inoculation, like a TB shot, where it's right under the skin, because you just need a small amount of that in your system for you to have that frequency IN YOUR BODY to go and touch this being for 8 to 24 hours it could last.

David: Now, if you didn't have the inoculation and you touched the body, what happens?

Emery: You would destroy it. It would, within 8 hours, turn to this jello-like substance and gel, and it would just break down. It would just turn to liquid.

Corey: Is this a certain type of ET . . .

Emery: Yes.

Corey: . . . like interdimensionals that were using some sort of a medium here to exist in?

Emery: Yeah, absolutely.

Corey: Because a lot of times their energy field will hold together these types of materials to give them a body that they can then use as base material to manipulate with their consciousness.

Emery: Yes, so . . . very good point, because a lot of these extraterrestrials . . . you might see just one person here, but actually they're bilocated, and they might have three of them, but it's one person, if you will.

So picture one person in a craft outside Saturn, let's say, 33 miles long – I'll just throw that out there – and that is projecting and bilocating – an interdimensional creature – a few beings down here, or just one.

And it still is him, and he IS able to manifest into the 3D and have a solid form and hold this energy, you know, like you were talking about.

So this inoculation would allow people to go ahead and work on these beings and to get whatever they needed out of these beings, or just get the samples ready, or whatever is going on, without damaging the body.

Corey: I'm sorry, was this what . . . the term we were calling “biotagging”?

Emery: YES, Corey! Exactly. Biotagging.

Corey: Okay.

Emery: So they would biotag us with this genetic material so we could do this.

What's interesting is: some of the technicians that I remember were hootin' and hollerin' about getting injected, and it became a big thing, and during my stay there they stopped doing inoculations and went to this viscus gel.

And they would put a dime size of this on the back of your hand, before you gown up, and that had enough of the genetic material that would saturate through the skin and into your body.

So inoculations were gone. Now they would use this genetic material with this gel, and then you have a good 24-hour window to work on this being without destroying the tissues of it or being of the same frequency.

Corey: Right and they can also mimic that frequency, bio-neuro frequency, with technology . . .

Emery: Right.

Corey: . . . and now can just create a field in the room . . .

Emery: Uh-huh.

Corey: as long as that being's body is kept in that field, it won't break down.

Emery: Right. Exactly. A big problem they had when they were harvesting a lot of these ETs from downed craft, especially in the '40s and '50s and '60s, was they would basically just grab them and put them in these 55-gallon drums, special containers, full of alcohol or formaldehyde.

And they thought this was going to basically keep them alive, and they just turned to liquid – you know, just gel –

David: Huh!

Emery: . . . and because chemicals also react to these bodies. And a lot of programmed life forms that are not completely organic, also will melt in these things.

So when they open up the canisters, it's just all goo, and there is nothing there.

So they started using water and other substances, saline, to transport bodies . . .

Corey: Yeah, distilled water.

Emery: They'd freeze them right away – and, yeah, distilled, purified water without new minerals in it for conductivity – and transport these beings around the world.

And some of the beings I got were actually still not thawed yet. They were still frozen.

David: You're going to let somebody give you alien DNA? I mean that seems really frightening.

Emery: Very frightening when I look back at it. And I remember a lot of the jokes between the docs and I were, “Oh, my gosh. We're going to wake up some day, and we're going to be dead from this crap.”

But you have to understand, I was a really young age during this . . . you know, when I was doing this.

Corey: At the age when you think you're bulletproof?

Emery: Yeah, when I was bulletproof, and I knew everything back then.

Corey: Right.

Emery: You couldn't tell me anything, because here you are allowing someone to put genetic material into your body, and on multiple occasions, and not thinking anything of it, because I'm thinking to myself, “My goodness, these people love me here. I'm one of their best employees. Of course, they're not going to do anything that would hurt me or kill me, right?”

So, you know, I had that kind of mentality then.

Now, oh, my goodness, it would be a totally different situation. And that's kind of where I ended up being able to work on these higher echelon extraterrestrials, because I didn't have limitations. I would do whatever it took to advance myself in that project at that time.

And if I said, “No,” then I probably would have been let go, to be honest.

David: Were you aware of any deleterious side effects of this extraterrestrial DNA?

Emery: Yes. And they DID brief us on this that some side effects could last anywhere from 24 hours to 7 days.

And some of the side effects could be . . . your eyes would change color, maybe. Sometimes you would have a luminous glow where you . . .

David: Really?

Emery: . . . in the dark would actually cast about three inches of a glowing light that you could not see where it emanated from was one thing.

David: Hm.

Emery: But nothing that was . . . I never got sick or a headache or a stomachache. It was never anything like that. It was just weird morphogenic anomalies.

Corey: Well, other than what you described, the TB-type administration of the genetic material, did you receive any other inoculations or shots?

Emery: Yes. Unfortunately, even when we join the military, you know, you stand in the line . . .

Corey: The gauntlet.

Emery: . . . to get 15 shots of who knows what. And in these classified projects, you have to be inoculated with many different things.

And some of the things, I do not know what they were.

Later on, I found out that these things were antibodies, because in the past they had many outbreaks of different types of diseases in there that were of unknown origin.

But they were able to isolate these viruses and bacteria, make an antidote for that and use vaccines for it, and then you would be given these things.

And I never had reactions to those either that I'm aware of.

But I think it did, later on down the road . . . I think, with my neurological system, I think there was something going on that was . . . as I got older.

Corey: Yeah. And a lot of these injections they give you DO affect your neurological system.

I was given an inoculation for an intuitive empath that is supposed to enhance your abilities, and it REALLY enhanced them. It was amazing.

I was told that we received it from ETs. I don't know if it came from a genetic experiment where they were dissecting an ET, found chemicals that enhanced us, or if it was handed over to us. I don't know.

But it DID have non-human genetic material in it, or enhancements in it, and, yeah, there were a lot of side effects.

Emery: Right. I can attest to that, too, because a lot of the blood and stuff we were taking from these extraterrestrials, trying to figure out how they heal and all sorts of interesting . . . and how it raises consciousness.

And in their blood they had proteins and different types of antibodies – amazing different . . . a whole plethora of amazing different cellular activity and proteins in there that they were recombinantly, synthetically, making from this and selling it to Big Pharma.

Corey: You know, it's interesting enough, you may have dissected genetic material that had come in through the Space Program, . . .

Emery: Sure.

Corey: . . . because we've talked about on Cosmic the human slave trade.

Emery: Right.

Corey: But there is also . . . We receive a lot of technology from non-terrestrials by giving them genetic materials from humans and, you know, plants and other things on Earth.

Well, we receive genetic materials in trade as well from all over the cosmos.

And I've heard that some major breakthroughs pharmaceutically have occurred from these biological samples.

Emery: Yeah. Absolutely. I mean, the advent of them now testing with these amazing pieces of equipment that we don't even have in the civilian world as far as . . . like, you're talking about Xeroxing people.

They actually Xerox cells now in the same fashion that you were talking about. And they're doing it with the genetic material that they're acquiring from these ET autopsies and whatnot and the tissue samples from these beings.

So I agree with that, and I think Big Pharma has profited immensely from these projects, because the corporations patent these proteins and genetic materials and then they sell it to Big Pharma.

Corey: And not only that, pharmaceutical companies, the inoculations they give people, the flu vaccines, those . . . the viruses, live or not, inside those inoculations are a delivery system to carry genetic changes to our DNA.

Emery: Right.

Corey: So we are doing genetic testing on our own people with non-human DNA,

terrestrial non-human DNA, and DNA from off the planet.

Emery: Yeah. I've read a couple of briefings on this that stated, especially with the part that has to do with your hormones, . . . So they're really kind of turning men with . . . shutting off their testosterone and making more estrogen.

And for the women, they're just giving them more estrogen and shutting off their testosterone with these supplements and pills.

And that's not good because then it starts to mess up the body because the body's not in homeostasis where it's supposed to be.

Because if it was, everything would just activate and open up and our bodies could heal itself.

Corey: Now, I know you've followed the stories out about vaccines and how they're finding more and more evidence that it contributes or causes autism.

Have you seen anything or have you seen any studies about this causing autism and have you heard anything about Starseeds and the possibility that some of these autistic children are Starseeds that have been targeted?

Emery: I'm not part of those projects, I'll just say up front, but I have heard through my colleagues that are part of projects that are associated with that that there is something going on as far as the inoculations with these children. And they ARE special.

Everyone is special, but you know they ARE special, too.

Corey: Oh, yeah.

Emery: And there's something that's going on in the genetic makeup of this that HAS been either accelerated for the good or suppressed.

And I know you know a little bit more about that than I do, but that's all I really know as far as the autism goes.

Corey: Hm. Interesting.

David: A lot of the people who are researching autism have also done genetic tests independently and concluded that there are highly abnormal and toxic amounts of aluminum in the bodies of people with autism.

Corey: Mercury.

David: What do you think is going on with that? Could people chelate and get rid of that aluminum and maybe reduce those symptoms?

Emery: Oh, yes. They can . . . That stuff can be taken out of the body and be chelated out in more than one way.

And there's special waters out there – the fourth state of water, the plasma state of water – that have recently been introduced to the public that allows . . . You know, we had one of our . . . My colleague had one of his workers that was welding, and he got mercury poisoning and some other metals in his body.

And he had a family and some children, and he was very young, about 35 years of age.

And he was so toxic that they moved him right to Hope Hospice and said he had four days.

Corey: Hm. Because that goes through the blood-brain barrier, doesn't it?

Emery: Yes! That's the problem, because you can't get it out once it's in the brain because the fat in your brain sucks it in without taking . . . you could imagine.

But we were wrong. The fourth state of water has some sort of binding abilities, and it actually bonds to the metals in the body.

So I think he drank maybe 9~12 liters of this in one day, and then two or three days later, he was COMPLETELY free of mercury and lead.

And I'll tell you right now, there is none of us here on this set that does not have mercury and lead in us to some point. But he had zero.

So somehow this advanced water stimulated his body and bonded to these metals and brought them out of the body in some form or fashion. And I don't know scientifically how, but this has been documented.

David: Well, but in general, if someone had . . . like if they go to a naturopathic physician, for example, could they get prescribed a heavy metal detox?

Emery: Yeah. Well, there's chelation IVs. Of course, they're the most popular to take these metals out of your body.

And I would highly recommend anyone that has metal poisoning to do that or find this fourth state of water that's out there that's bottled. And you can buy it bottled.

David: And what is the fourth state of water exactly?

Emery: It's a purified water where they run plasma gas through it, and it changes the structure of the water, the molecular structure.

And they've had some miraculous things. This water hydrates 10 times more than water, so you only need to drink that much *[Emery separates his thumb and forefinger 2"]* of a regular water bottle to get the same hydration.

So the military is adapting it and doing some testing now because it cuts down the packs for the soldiers. You know, those are sometimes 80-lb packs that these guys . . . It could be up to 15 pounds of water.

Corey: A gallon of water weighs a couple of pounds.

Emery: So by eliminating all that, still having the same hydration, imagine how much farther you could run and not have all this weight, or imagine you wouldn't have to take as much water on a deep space exploration using gas combustible rockets.

So in the 3D, this is where it's going.

Corey: We're getting to a point now to where we're going to start managing our own genetic and spiritual progress. We're not going to be a Petri dish for dozens of different ET groups and black ops groups.

It's something that's going to be exposed and over time become public, and something that we're all going to begin managing ourselves. It's not going to be done behind our backs.

Emery: Right. And that's amazing because once you have control over your own body, amazing things can happen.

One of the reasons the extraterrestrials find humans so fascinating is because we are one of the most adaptable creatures in all the universe.

That means you can poison us, you can throw UV light at us, you can throw electromagnetic waves at us, and you know what, over hundreds and hundreds of years, we adapt. We're like roaches. We can't be killed.

Corey: All evolution happens through stress.

Emery: Yes.

Corey: One of the things that I was told is that our chemistry, our body makeup, is extremely easy to manage and manipulate, more so than a lot of these different ET groups that had to do it over many years of adding technology . . . and managing themselves over many years.

Emery: Exactly, Corey. They over-engineered themselves over time.

Corey: Uh-huh.

Emery: And that is why a lot of ETs are coming back now, and that's why a lot of the stuff I heard you say about the trading and stuff. . . you know, they're trying to fix themselves.

And a lot of them are also just us a couple of million years from the future.

Corey: Right. I've met a few of those.

Emery: Yes. So what's going on now? Do we keep our genetic material in a bank right now?

Corey: From what I've been told, we're going to go through quite a phase in the future. We're going to go through a phase where we rebel.

We find out about all these genetic programs, and we'll rebel against it, and people will start hijacking or hacking their own DNA. And things go crazy to a point to where there are no real different groups of humans.

There aren't really Caucasians and different types of humans. They all kind of mix for a while.

And then we start playing with our genetics in a way that we start tailoring them how we want until we get over that point and then start getting serious about being a cosmic population that is managing their DNA properly.

Emery: Right. Yeah. We are the superheroes of the universe – they look at us – and we look at them like they're the superheroes.

So it's a really neat thing when you are communicating with extraterrestrials to hear this relayed to you, because we think we're just so scrawny and not a big deal compared to that big universe and all those amazing creatures.

But we all work synergistically together, and they are us, and we are them in a way – not all extraterrestrials, but some.

David: I find it fascinating, Emery, that we are coming up against a belief system that's very strong in which people have been taught to believe that the Earth does NOT provide for the health of its people, that we would need to synthesize or artificially manufacture something that wouldn't already be provided by nature.

And so as we go back to that belief, . . . Like you're talking about Chinese herbs, that they're actually superior to the things we could manufacture.

Do you feel that ultimately, we are living in a benevolent living cosmos that DOES provide for all of our needs?

Emery: Absolutely. And that's why we're here today. I mean, the Earth HAS provided for us and so HAS the universe, showering us down with coded energy and material to let us live with the Earth. They're all working together. They're one big giant family, think of it.

Think of all the planets as people. Think of the universe as one.

Everything you need is right here. It's the body. And if you get it at a homeostasis working correctly, it'll fix itself, and all that other stuff just helps it mutate into either a stronger body.

So I think . . . And one of the programs I was working at with regenerative long-term space travel was: there was no part of Earth on these crafts.

And people traveling, and astronauts traveling, were deteriorating, especially over nine months.

Corey: Yeah. They started piping in the frequencies of Earth.

Emery: Right. So they started recording crystal frequencies, rock frequencies, tree frequencies, and all this stuff, and actually bringing plants and crystals and rocks . . .

David: Really?

Emery: . . . into space with the astronauts.

David: Wow!

Emery: And guess what happened? They stayed up twice as long without any . . .

because they had a part of Earth with you.

Unlike Superman, where if he saw kryptonite, part of his planet, he would be killed, it was the opposite. It allowed us to survive.

Corey: I think you described homeostasis. Life develops in homeostasis. So any planet where life is developing on it, it's going to develop a homeostasis to a point to where everything is going to be there to keep homeostasis, . . .

Emery: Right.

Corey: . . . including medicines.

Emery: And so far, Gaia hasn't kicked us off the planet, yet, because we've been paying rent, but we've been partying too hard, damaging the planet.

So we need to shake that up, and we need to clean up the planet. That's the most important thing to me because without the planet, there is no us.

And then the next more important thing to me is all the animals and mammals of the planet.

And the third thing most important to me is us, the humans.

Because we need all that to work in homeostasis, including the plant life, or we don't exist.

So it's important that we take care of this planet, and that we clean it up with all the horrible things we have done to it that even are not discussed, which you know about, with deep underground testing.

And this all poisons the planet.

And Mother Earth and Gaia will not stand for that much longer.

She's been through this before, and she WILL cast us off, so we need to get the rent up ahead of time and start cleaning up our apartment or there's going to be some fury coming down on us.

David: I find it interesting . . . I stopped watching commercial television in 1991. I was really disgusted with it.

And one of the things that I noticed before I really quit TV, and, of course, now I'm

happy to be doing a benevolent form of television that actually raises consciousness, but I would notice that there would be a toxic food product, like a fast food or a processed food, followed immediately by a commercial for pharmaceuticals, which are treating the effects of eating those foods.

So it's as if . . . And then the only other thing you see are commercials for fossil fuel burning vehicles.

Those are the three big things: fast food, pharmaceuticals and cars.

Emery: Right.

David: So how do you think we can un-hypnotize people from the belief that you MUST go the pharmaceutical route if you get in trouble?

Emery: You just did it.

David: Ha, ha.

Emery: And that's what we're doing here. We're making people aware. It's really up to us and up to other people like us. And you have options. You always have options.

And soon there's going to be a lot more options that will just be all out there where you can choose what you want to have, and you can tell the doctor what you want.

David: Well, what was so interesting – I'm thinking about Corey now – is when we started the show, he was not clean eating.

And in the course of some of the ET contacts he had, . . . why don't you tell us a little bit about that, how that changed you.

Corey: Right. Yeah. I was about 80 pounds heavier than I am now. But, yeah, they were trying to get me onto a high frequency diet for some time. And I was eating corn dogs and ignoring them to a point where finally, I ended up getting food poisoning, and I was sort of forced onto this path.

Emery: I remember this, yeah.

Corey: But ever since I changed onto this path, the changes that have occurred in me have been just amazing - the cognitive changes, the health changes. I mean, they've been undeniable.

Emery: Oh, absolutely.

David: And you were able to get off of pharmaceuticals that are supposedly never able to be quit.

Corey: Right, yeah. I was on heavy doses of Xanax for PTSD, and I was able to quit them cold turkey. The doctor told me not to do that. I quit it cold turkey.

I didn't have any symptoms from coming off the medications. It was an amazing experience.

Emery: Wow! Yeah. I can correlate to that because I recently changed my habits lately.

And the messages and the remote viewing and the intuition has just skyrocketed by doing so.

So there is definitely something to what you're putting in your body and the frequency for that.

David: And I remember Pete Peterson on this same topic telling me that people simply changing their diet can lead to as much as a 20-point boost in the IQ.

Emery: Oh, for sure!

David: You believe that?

Emery: Yes, sir! Absolutely.

David: Why do you think that would happen?

Corey: Toxins and inflammation.

Emery: Yep. Inflammation and toxins – that's the key.

David: How would that increase your IQ, though, if you get rid of inflammation and toxins?

Emery: Well, because inflammation is slowing up your heart rate. Your heart has to work harder. You're full of cholesterol and all these other fat soluble things floating around.

And that limits the amount of hemoglobin and oxygen GOING to your brain.

David: Ah!

Emery: So by increasing the oxygen content to your brain, you increase angiogenesis, the formation of new blood vessels, which then saturates your brain and gives it all the energy and oxygen and food that it really needs.

And things hinder that like smoking, taking drugs and eating bad, and whatnot, not exercising.

So by just eliminating a couple of those things and getting out and moving around a little bit, you're increasing this mana that's in you and allowing the frequency to change and take place.

David: And here at Gaia, we have a lot of programming about tai chi, yoga, things like this.

How do you see those movement disciplines as related? Is there a reason for people to be doing that kind of stuff? Would that also help?

Emery: I think it's very beneficial, in my own opinion. I do all those things.

And, you know, you're bringing energy in, and you're thinking positive. And just that alone, reducing the stress in your body, being able to shut your mind off for just an hour a day, does wonders for your consciousness and for your health.

David: Well, that's awesome. I want to thank you, Corey, for being here. I want to thank you for being here, too, Emery. And I want to thank you for watching.

This is “Cosmic Disclosure”, and we'll see you next time.

Suppressed Medical Technology Season 11 Episode 4

Cosmic Disclosure; Suppressed Medical Technologies Season 11, Episode 4

13 Jun 2018 [images blocked]

David Wilcock: Welcome back to “Cosmic Disclosure”. I'm your host, David Wilcock, here with Corey Goode and our guest, Emery Smith.

Emery, welcome back to the show.

Emery Smith: Well, thank you, David, and Gaia, for having me again.

David: And Corey, thanks for being here.

Corey Goode: Thank you.

David: So we're going to get into suppressed technology in this episode, which is a vast subject. And we're going to focus in to some degree on medical things, but also just beyond that as well.

So we interviewed William Tompkins before his death, and he talked about some very strange stuff.

He felt like if you could live just a few more years that things would come out that would allow you to live much, much, much longer.

Emery: So there's a medical corporation out there and a spine surgeon who has invented this A2M alpha-2-macroglobulin protein.

And what they did is they get this protein from your blood. It's in your blood.

And it's a protease inhibitor, so it stops all inflammation once you concentrate it and inject it into the body, into your joints or whatnot.

What they found out is they were able to regenerate articular cartilage, which is the cartilage that lies under your joint in the bone. So it's not bone on bone.

David: In the knee, you're saying?

Emery: Yeah, in the knee. So here's your knee right here. And then between that, that's all covered with articular cartilage.

And Corey knows this very well because he's getting one of these procedures done very soon.

And what happens is that grinds away after a while and tenocytes, which are cells in the articular cartilage, are the hardest thing in the world to regenerate because there's barely any blood going to it.

So that's why we have all these knee problems and joint problems.

But by putting this A2M protein in there and reducing the inflammation, it seems to heal itself and regenerate.

Now, I've been able to regenerate tissue forever in the mil labs [military laboratories] and in modern day science, but what I was NEVER able to do was to anti-age a cell.

And guess what: one of the side effects they found out of doing this study was that it actually anti-aged tenocytes – THE HARDEST CELL TO EVEN REPLICATE. It anti-aged it!

So what that means for us is . . . And what this physician is doing is he's actually going on now and he made a recombinant form of it, which means they have a synthetic form of the exact same molecular structure of the actual protein in your body.

So this is going to be off the shelf. So instead of buying like aspirin to get rid of your headache, you're going to reach up and get some A2M.

Or you're going to get this . . . Instead of taking human growth hormone and all these replacement therapies, you're going to be taking A2M.

And that's going to help systemically anti-age other cells. Because if I can anti-age a tenocyte, the hardest cell in the world, then there's no problem of anti-aging all the other cells, [which] is what I'm getting at.

Corey: Well, how are you judging the age of a cell?

Is it by the amount of degradation in the telomeres?

Emery: Yes.

Corey: Okay. So is this a type of telomere therapy?

Emery: Well, right now it's so new, Corey. This is the first study that came out that

showed this, which it wasn't even about that. But they found out it does do this stuff.

So I can't say because I don't know yet. I haven't seen any additional information other than that, but I would assume that's the only way you could test.

Corey: Okay. Have you seen anything about the small eddies created by the gravitational field that causes aging, [which] along with cosmic radiation, is what basically kills us and causes us to age?

Emery: Right. The only reason we age is because of this radiation from the Sun.

Corey: And the gravitational force . . .

Emery: And the gravitational force.

Corey: . . . which creates time.

Emery: Right. And time . . . that's a whole other story.

Corey: Right.

Emery: I was working on a classified project up in the New York area, about 30 minutes south of New York, and there was a device in there, a Teslatron unit, they called it.

And I can't get into specifics of it, but it was a type of time machine distortion-type thing that used Tesla energy to cure people of inflammation and diseases like HIV and herpes and whatnot.

And they're very successful with it.

It was reserved only for the elite and the politicians of our current realm here in the United States. If they come down with some diseases that were inappropriate, they can go down here [and] get zapped.

And that unit was also anti-aging people. Because when you get in there for an hour and sit down in this room, it might feel like 15 minutes but you've been in there for an hour.

And you take stopwatches in with you. There's a stopwatch locked in your locker. You have one. And that definitely shows and proves that you've been actually gone for a while, but you don't feel like that. And time DOES get distorted in there.

And you also lose weight and lose toxins and whatnot.

And I'd like to get more into that, but that's kind of a classified project right now. But that IS going to be available for the public in about a year.

So that's a new thing that's coming out that people are going to be able to look forward to.

David: Well, since our focus on this show is the Secret Space Program and the greater reality that we're learning about, William Tompkins was so excited about these life extension pills because he claimed to have met with beings that pretty much looked like us but lived a lot longer than we did.

What do you know about those types of beings, if anything?

Emery: Yeah, those beings, in their genetic DNA profile and also just in their bodies, have a way to reflect ultraviolet radiation and other electromagnetic fields and gravitational forces. And this is how they do it.

And by doing that . . . If we had that capability, we would also live a lot longer.

And that's why things in the past, in prehistoric times, grew to just unimaginable sizes because the atmosphere was so much thicker and not all that light was coming through.

Plus, there were lightning storms and thunderstorms that could be years long. And guess what happens when lightning hits the water . . .

Corey: Yeah.

Emery: . . . you create the Fourth State of Water. Secret!

David: Hm.

Emery: And guess what happens when you drink that water – mega plants. I'm talking BIG tomatoes.

So these things right now are available for us to get healed, like this Fourth State of Water I'm talking about.

So we have lots of technology that is suppressed, and we have a lot of technology that's not. Because what happens is, as a device manufacturer myself, you come out and you create something and you patent it.

And as soon as I send it in, the FDA says, “No, no. No, do it again”. Or your patents get refused.

Because you can't just patent anything, especially medically, that's going to help someone.

You could say it does this: “Well it just concentrates growth factors.” Well, that's okay.

“Don't claim that it concentrates growth factors that you're going to put in someone's elbow and stop their arthritis because then you're messing with the pill company. So we don't want to do that.”

So you can only say so much. So what I do is I create medical devices that just do certain things biologically. “Oh, it concentrates this cell or this protein.”

Then I give it to the doctor – I give it to you, Dave – and I say, “Hey, it may or may not work for you. This is what it does. Let me know how you like it.”

Then they come back to me. “Man, I can't believe what it did! It healed this wound in two weeks. We couldn't heal it in 12 months.”

I'm like, “Wow, that's fantastic. I never knew that could have happened. Why don't you write a white paper on it and publish it at a major university and let me know.”

So this is how I got to this point with the advice on medical devices and with a huge roadblock with the government and the FDA and other governing bodies.

It was very, very difficult, very hard.

David: Let me ask you kind of a pointed question. A lot of these so-called elites really look almost like Sith lords out of “Star Wars” or something. They don't look healthy. You can kind of see on them that there's something really wrong.

So if they have access to all this great technology, then why don't they look beaming and radiant and young and beautiful?

Emery: Maybe it's by choice or maybe someone is controlling them.

Corey: Yeah, the true elites are not the ones that we think we have the names of. That's for certain.

Emery: That's right. I mean, they're puppets, too, and people don't realize this. And Corey gets it.

But these things . . . These people even on the elite side . . . There's always something else going on that you're not aware of. And everyone has dirt on everybody, and things are happening up at that echelon that are probably just too much to get into right now on this show.

Corey: And I've heard also . . . We were talking about the avatar technology, using electromagnetic fields to push people into clones or back into their bodies. I've heard a tale of some of these people: when they're in public, they get pushed into their sick bodies.

When they're not in public, they get pushed into an avatar body.

David: Oh, wow! Corey, one of the things that seems relevant to all this is this very bizarre experience that you have had with a type of age regression.

And I don't know if Emery is familiar with this aspect or not, so this is a great opportunity for us to kind of drop this live and just see how it goes.

So why don't you tell us a little about that.

Corey: Right. Other than the fact that I've been talking to 8' tall blue birds, this is another part of my testimony where people are just like, “Phlusp, I can't deal with this!”

Emery: Right

Corey: The fact that in the 20-and-Back programs . . . It's kind of like a stitch in time. They pull you out of this timeline, and for 20 years, you serve, you know, . . . the 20 years.

At the end of that 20 years, you're brought back to the LOC. You're given a debrief . . .

David: Which is Lunar Operations Command.

Emery: Right.

Corey: Lunar Operations Command. You're debriefed, you're chemically blank slated, and then through pharmaceutical means, they take you . . . They put you on a gurney. They sedate you first.

They put all of these foam things all around you and Velcro you down so you can't move, . . .

(7 – Corey strapped to gurney and foam frame)

Emery: Uh huh.

Corey: . . . and then they give you an IV. And the IV is a pharmaceutical method of reversing your age, and it takes about two weeks. They put you in a chemical coma for about two weeks as the pharmaceutical is regressing you back to a certain age.

And at that point, then they take the age regressed you and send you back through time by putting you into this huge MRI-looking machine where the bed slides out.

It's like . . . An MRI is this big *[Corey holds his hands about 6" apart to show comparison]*, and you slide in and out of it. This one's like an 8' long MRI-looking machine *[Corey holds his hands about 12" apart, which means the MRI he's referring to is much longer than a standard MRI]* that the bed slides out of.

Once you're regressed pharmaceutically, they then put you inside this device, and it turns on and brings you back into the same device but 20 years earlier on the LOC.

Have you heard of any pharmaceutical therapy that can reduce age or the work on it?

Emery: I have heard of some of this stuff in the mil labs when I was down there, but I wasn't part of that project. But I know there were a lot of people that were part of that project, and they were definitely dumping a lot of money into that project – more than some of the stuff that we were doing.

Corey: Absolutely.

Emery: So you can see how important that was.

During some of the briefings I had, there . . . We know some of the compartments that are near us, . . .

David: Okay.

Emery: . . . and sometimes all the compartments will meet in a big meeting room once a month.

David: Oh!

Emery: And they do base-type talks, and they do small updates on what the compartments are doing. And they also talk about finances, and where money is going, and who has money, and also who needs support.

They'll move technicians from this to come over here to help them to get this done and put this on hold.

Corey: And that's how through compartmentalization you learn all this different information that is compartmentalized from each other, because you're moved within these compartments.

Emery: Exactly. And that's how I was able to do not just, you know, extraterrestrial bodies, but hybrid bodies, clones. Then I moved on to spacecraft and from there on to energetic weapons and also portal technology.

David: Was there a name for these conferences? What were they called?

Emery: Well, it's not a conference. It's just a base meeting.

David: Okay.

Emery: It's a base conference meeting that they have once a month. And then you go in and everyone sits down . . .

Corey: Unit directors . . . like the compartment directors.

Emery: Oh, absolutely. And there's about 300 people. And there's many different meetings, so you know, because everything is split up.

I mean, I was in this medical pavilion. So that was just us. And there were about 300 members there that come to this meeting once a month.

And that's not everybody. It's not all the employees, by the way. It's just the compartments that they want to debrief or tell us there's going to be a change . . .

Corey: Gotcha.

Emery: . . . or even base changes, security changes – all sorts of stuff. And they do change things very often.

Corey: So it was in this context that the age regression therapy came up:

Emery: That's where I found out about age regression and regenerative properties that

they were working on with cellular material and chemicals.

And they were trying to reproduce neurochemicals because neurochemicals have something to do with anti-aging.

Corey: Uh hm.

Emery: But I don't . . . I wasn't debriefed on the scientific part of that, so I can't answer those questions.

What I DID catch out of you, though, is you said 14 days for regeneration. And that is the key number that is used when we 3D print bodies sometimes and 3D print organs and things like that.

Because the body can only regenerate at certain levels of time, . . .

Corey: Exactly.

Emery: . . . and not many people know that.

Corey: And a certain rate.

Emery: And only 20 years? Well, hey, two weeks is not bad, because we can sometimes do bodies or limbs.

Corey: It has to do with metabolism, right? The rate of metabolism can only be pushed so far.

Emery: That's right.

David: Well, another aspect of what he's describing is temporal anomalies – time travel, time shifts, time slipping.

So if you were in these monthly base meetings, as you said, in this medical pavilion, were you aware of temporal research going on? Did you ever hear anything like that?

Emery: No. No, I have not. Sorry.

David: Okay.

Emery: Yeah. I know . . . Just from after getting out, I heard some things, but not while I was in there at all.

David: You were talking to me about this military guy who was working on a government contract, or secret government contract, for a very interesting pill.

Emery: Oh, right.

David: Could you talk to us about that?

Emery: Yeah, the limitless pill. What had happened is the astronauts and the pilots and the special forces guys were taking too many amphetamines. And it was a normal thing back in the day to take amphetamines to keep the troops going and to keep the pilots focused or the astronauts.

The problem is there are side effects to those, such as addiction, and also [they] throw off your shot because you're shaky. And that's not good.

Corey: Ah huh.

Emery: So they came up with a new pill. And what it did was it allowed you to focus and be calm and be able to handle 10 things at once very accurately.

David: Hm.

Emery: It also increased delta, beta and zeta waves in the brain to help you actually remote view anywhere from six to 10 seconds into the future. So you would be ahead of the opponent if they were throwing a punch at you for sure.

Corey: And I'm sure also the inoculations we got for AI abilities were speeding up our neurology.

Emery: Right.

Corey: Our neurons . . . There is a certain amount of resistance in the neurons, and it did something to where it allowed there to be less resistance for the impulses to travel MANY times faster.

Emery: Right.

Corey: And that was good for us when we were communicating with non-terrestrials because they think MUCH quicker. That enhances their ability to have telepathic abilities.

So when they increase your neurological fire rate, they're also increasing how quickly you can think. And you start having weird things like that, like remote viewing. You

see things happen before they occur.

Emery: Right. Absolutely. Yeah, the science behind that is exactly that, speeding up neurotransmitter chemicals.

Behind this pill is actually a voltage thing.

Corey: What is it: the neurons are sodium or potassium pumps that create the resistance for electrical impulses?

Emery: Right. And by speeding up the voltage, too, and getting the voltage actually where it's supposed to be – because everyone's voltage is off a little bit – it creates another homeostasis in the neuro system.

And that's what this does: it manages that and increases . . . You know, usually, people are low voltage, and they increase the voltage at a certain point and it does exactly what you said: it speeds up that signal x10.

Corey: Yes.

Emery: So imagine if you're thinking 10 times faster than you already are right now without having an elevated heart rate, without shaking, and having 10 conversations with 10 extraterrestrials at one time.

And you're absolutely correct with this because this is how it is.

When you communicate with an extraterrestrial telepathically, we're trained to memorize about 100 to 150 questions. Because as soon as you see them and make eye contact, within 0.08 seconds, all your questions are answered, and you're sitting there smiling or crying because you feel like an idiot human, and they're just sitting there smiling and laughing back.

Because that 150 questions that I just got answered just brewed about another 1.5 million questions. Ha, ha. And then you have to wait for the next meeting.

So it's a really dynamic thing telepathically to have communication like this.

And the great thing about it is you don't have to worry about language barriers and things like that. And it's all based off more of an emotional response. It comes to you emotionally.

I know that sounds weird.

Corey: Yeah. It can come in emotions, smells, tastes, sounds.

Emery: Right.

Corey: It can come in as your own inner monologue voice. It can come in as little pictures in picture frames.

Emery: Sure.

Corey: A lot of it . . . And it depends on the non-terrestrials. They will communicate in different ways.

Some of them, just like us, are more visual; some of them are more . . . you know.

Emery: Oh, right. No, I completely agree. Yeah.

David: It's interesting to me to note that as people develop great proficiency on an instrument, like if you, for example, are a jazz improvisation musician, when you really get into the detail of how people play those solos, you have to think faster than most people do because you're not only executing the notes that you're playing, but you're planning out what you're going to do next.

And correct me if I'm wrong, but a lot of insiders have told me that musicians tend to be much more capable of being brought into these psychic, telepathic type programs.

Corey: Well, just by learning how to read music and how to compose, you're creating different neurological pathways in the brain which gives you more bandwidth.

So yeah, you're going to have more neurological, I guess, wiring.

Emery: Right. You create an extra crease in the brain when that happens. And that's why we always say: when we're looking in our brain in surgery, if it's really wrinkly, we're like, “Man, this guy must be pretty smart”.

David: Really?

Emery: And if it's really smooth, that's an insult we do to each other, “Oh, you're such a smooth brain”, because you're being stupid.

David: So why would the creases matter? I'm not sure I understand.

Emery: I really don't know. I don't even know if there's data to back that up, but this is just an inside joke we have in compartmentalized projects.

Because especially looking at extraterrestrial brains, it's just unreal the shapes of them, and some of them have four lobes, and they're extremely wrinkly. Ha, ha. And it's just an interesting thing.

So I don't know if that's medically a proven thing, but this is just an inside thing that I hear a lot of the docs and scientists talk about. So we adopted this as a joke.

Corey: This is a little off topic, but the brains that you've been looking at, do they have hemispheres?

Emery: Yes.

Corey: Okay.

Emery: There's four hemispheres to one brain stem.

Corey: Okay. All right. I was just wondering because I know how they were studying the electromagnetic fields, the electric body, and how the brain had to have two hemispheres, at least, to be able to process the electromagnetic field in a certain way . . .

Emery: Right.

Corey: . . . and use that as like a hard drive for your memory.

Emery: Yeah. I mean, not all extraterrestrials have – just to go back – four lobes.

What I'm getting at is there's many different kinds. And some of them also have this amazing harmonic ear type drum thing that is actually located as a disk in between the lobes.

So they are more like maybe a dolphin . . .

Corey: More of an auditory . . .

Emery: . . . or have an auditory-speech or frequency of either very low frequencies or very high frequencies, but not in the middle. And they say this is used for communication.

Corey: Yeah. What I was kind of curious [about] is: out of the brains that you were looking at, are they more similar or dissimilar? Are they pretty similar?

Emery: Well, you know, there are so many species, number one. You're talking about an unlimited amount of species.

Corey: Right. I was just kind of wondering how they develop on different planets.

Emery: And because of planets and their gravity and the type of body they have, it usually symbolizes if they've ever even been on a planet. You can tell by the body.

As far as the brain goes, there's just too many to go over.

Corey: Yeah.

Emery: It's just incredible. That's like asking all the brains of all the species on the planet.

Corey: Right.

Emery: It's THAT different.

Corey: The insect brains are very different than mammal brains.

Emery: Right. But they all have the five-star look, which is the head, two arms and two legs. And the brain, though, is always different. It could be very large or very small.

We thought we had an extraterrestrial at one point and it wasn't. It was a PLF [programmed life form] and it didn't really have a brain. It had some other globular formation in it.

And so it's really interesting to see how THEY make clones and PLFs, because ETs do this, too.

Corey: Oh, yeah.

Emery: They make all different kinds of things.

Corey: Especially like the Greys are standing operating hardware out there. So many different groups have been seen with these little automatons.

Emery: Yes. Yeah.

David: Well, this kind of gets into another topic we want to cover, which is the biohacking.

Now, Corey's people in the SSP Alliance were VERY concerned about artificial intelligence and losing our genetic sovereignty to machines.

But I'm curious about what have you done – and maybe we can open this discussion up – what have you seen regarding technology interfacing with biology directly, like as an implant or as augmentation?

Emery: Well, what they have done – this is what I know 100% – is they're using nanoparticles in the body that work with each other. And they're infused into the body, or teletransported into the body, and it's in your system. And you can get rid of it, but it's in your system.

And that allows them to control you. It allows them to . . .

Corey: It's very interesting. I was getting an update or an intel briefing, and in the programs, they've been trying to capture a certain type of caste of Reptilian for a while.

But if they were able to kill one, they would vaporize, disintegrate.

Emery: Yeah.

Corey: And they were finally able to create some sort of a field that would prevent them from disintegrating when they killed one. And then they did a post-mortem on it and found out that it was infested with nanites . . .

Emery: Yes.

Corey: . . . completely infested with nanites. And that's when they really began to realize that some of the Reptilian castes worshiped an artificial intelligence god.

Emery: Right. Actually, that being was made by artificial intelligence.

Corey: Hm. I was told that it was a biological being that at a certain point in their development, just as a matter of fact, they're all infused with this . . .

Emery: And this was Reptilian, correct?

Corey: It was a Reptilian.

Emery: For sure. There are these silos that make these creatures, and they are completely controlled. And they are not . . . They're different than a lot of Reptilian

races, but they are Reptilian.

Corey: Right. Yeah. I've seen the genetic Reptilians that we've created that are large, green, and just as scary as the real ones.

Emery: Right. Yes.

David: When you say “silo”, I'm thinking of maybe a 100' tall cylinder of metal. What do you mean by “silo” in this case?

Emery: Oh, the shapes of these craft or permanent stations.

Corey: Like the pods.

Emery: Yes. But we're talking very large. I mean, some of these can be up to a quarter-mile long. And it goes through . . . It's in a cylinder because it actually starts here, and then by the time the clone gets out and infused with everything, it's already grown to its full capacity and it's ready for work, we'll say.

And that was created by AI. Now, who created that AI is the question.

Corey: The intelligence goes back that this AI is so incredibly ancient, and it does not come from our reality, that it bled through another reality, and it's wreaked havoc in many, many galaxies over time immemorial.

Emery: Right. It's like a virus.

Corey: Yeah.

Emery: Yeah.

David: So you're familiar with the same problem?

Emery: Yes.

David: Where specifically did you hear about the AI problem, if you can give us any details you are allowed to share?

Emery: Ah, the first time I heard about it was in the projects. They talked about an artificial intelligence that could be a threat.

And they had captured a lot of these ETs with nanites in them. And that's how we knew, like, NO ONE would do that to their own body because it's not a benefit to it

unless it has to do with control.

And we found out through frequency generating receivers that even deep underground, it's still receiving some sort of, within time and space, message on a frequency.

Corey: Yeah, it is a quantum entanglement type of communication. We were using that in the programs.

They would have devices that had isotopes that had been entangled, quantum entangled. And no matter where they were in time and space, you had instantaneous communications.

Emery: Right.

Corey: If they had . . . When they were first working on temporal drives, if these people happened to travel out of phase or out of time, they would be able to tell by the slight delay exactly when and where they were located.

Emery: Oh, that makes sense. Yes.

David: The AI problem in your understanding . . . I just want to see if there's any discrepancies between what you heard and what Corey heard.

So what did you hear about the identity of the consciousness that is using machines?

Emery: We just heard that there was a threat that was AI, it was not from this dimension, and that it is now in this dimension, and it's on the outskirts of this Solar System.

Like there's a part of this AI, whether it's itself or . . . because it could be everywhere.

Corey: It is everywhere.

Emery: You know what I mean? And that's what they said. They said it could be everywhere.

Corey: It's not local to time and space.

Emery: Right. But it had a 3D something here, craft or something on the outside of the Solar System, that they were monitoring for quite some time.

David: It had a craft?

Emery: Yeah, it was either a craft or a station of some sort on the outside of this [Solar] System.

David: Okay.

Emery: We already had satellites out there long before . . . right after Voyager and before Voyager.

Corey: Oh, yeah, we were traveling then.

Emery: So we were traveling how far along ago? Can you say a date?

Corey: Oh, back in the mid-'80s, we were already traveling to other star systems.

Emery: Right. Okay.

Corey: So we were traveling out to the Oort cloud routinely.

Emery: Exactly. So that's how they picked up on us. And then what they found out, that frequency that emanates from that AI, from all of the ETs that they captured . . .

Corey: The AI signal.

Emery: Right. It's the signal. That's what they try to send back to kill it.

But anyway, what happened is all of these beings also had the same signal.

Corey: Uh huh.

Emery: So then they knew, "Oh, these are real organic beings, but they are controlled by something else – by this, as you call it, this AI.

Corey: And they can't block the field because, like I said, it's a quantum . . .

Emery: Right. It's from within time and space.

Corey: Right.

Emery: So that frequency can open up, send a frequency, and it opens up wherever they want. It's like a scalar wave; it could be anywhere.

David: All right. Now, one of the weirdest things that I ever heard that had a lot of people freaked out, . . . and I met this guy named Jacob. He was talking about an AI

system that he said was underground in the Earth that was built by the bad guys and that monitors everyone's thoughts, and that if you start to think in a direction that would lead to Disclosure, that would lead to a better planet, that it will start to make you tired, to feel anxious, to do just about anything you could to not want to read that information or watch that information anymore.

Corey: Well, that's a part of a wider network. The Draco many, many thousands of years ago set up a network that utilizes not only the ley lines to . . . Because, you know, they had this technology in orbit, and it used line of sight. It communicated with the other satellites around, and also it communicated by broadcasting through this grid system.

And it is a mind control system and a monitoring system of the consciousness.

And I know that it's incorporated some of our natural rocks and minerals to kind of store information like we would in a crystal.

David: Have you heard anything like that about the idea that AI could be nudging us in some way with our consciousness?

Emery: Well, I haven't heard of that place you speak about inside the Earth. But I have heard about the mind control devices that we have on Mars and the Moon and here that send these waves down here.

And also, of course, HAARP: everyone knows about these other scalar weapons here that can send stuff.

But I didn't know anything about receiving information from these things and being controlled by this one underground.

But those are the only ones I know about.

David: So I want to end this on a more positive note. And I think it's really important in case people haven't been watching all the other shows that we cover this aspect.

I have been looking at in “Wisdom Teachings” prophecies of a solar event, a Solar Flash, across like 35 different ancient cultures saying that it leads to a golden age.

And Corey, if you could bring that up for a moment about what is the Flash and how might it relate to this problem based on your information?

Corey: Sure. The way it's been described to me, and there have been conversations recently about it, our local star cluster is traveling through a part of the galaxy that has

a high energy cloud, okay?

And because of the Cosmic Web, all of the stars are connected through a thin electromagnetic tube.

And when one of these stars pushes into this heavy cloud, there is an electric feedback through all of the rest. And all of that begins to build up, and it begins to pulse through our star out to us.

David: And specifically, Corey, what did it say about that with the AI problem?

Corey: Basically, they have stated that that is when they plan on bringing a lot of these hidden technologies forward. They expect that . . . And more recently, I was told at the end of this Solar Minimum, which is like 10 or 11 years away, is when they expect this series of solar flashes.

And when this series of solar flashes occur, it is going to be basically like an EMP that's going to destroy all the technology that the AI uses as kind of like a fish in water.

It's going to remove all of that technology. It's going to clean all the bioelectrical fields of the planet and the other planets because this AI signal can reside in the electrical field of a planet for thousands, millions of years until technology comes by for it to piggyback on.

So basically, this AI signal and all of the technology that the AI is utilizing is going to be wiped out.

And at that point, they're going to bring forth all of these technologies that we've been able to see in the background.

Emery: Oh, beautiful.

David: Did you hear when you were in there if there was any . . . At that time, were they aware of any effective countermeasures against AI?

Emery: Yes. They were definitely weaponizing space. They were sending out more probes to that area.

And that's just US government, not the underground projects.

Corey: Right.

Emery: They have their own agenda with it. They'd rather capture, study, bring it here, which is not good.

Corey: Well, sadly, a lot of them worship it. They're AI prophets now.

Emery: Wow!

Corey: They're into trans-humanism.

Emery: Right.

Corey: They see that as the Ascension, or technology ascension.

Emery: Okay. I know those people. Yeah.

Corey: But those people are going to be very disappointed, because when this Solar Flash occurs, it's going to wipe out all of that technology, and we're going to have an opportunity to bring in new technologies and be free of the AI signal and all of the ETs that have been controlling us.

Emery: Wow!

David: Let me make a statement about this that both you guys . . . I'd like to hear your thoughts on.

And that would be: if we go with some of the things Corey said, there's the possibility that this AI may be almost as old as the universe.

And I've wondered perhaps if these solar flashes were an adaptive response of a living universe to be able to continuously cleanse this infection and keep renewing life and stop this thing from spreading.

Corey: I was told that what's occurring with the Solar Flashes is just natural celestial mechanics.

David: Right. But there might be some intelligent design behind it . . .

Corey: Oh, yeah. Definitely.

David: . . . to defend against this ancient threat.

Corey: Right. Well, after the Solar Flash, it changes the energy of a system to where a lot of these negative beings . . . it's not palatable for them. They can't be in these

systems.

So there could be some sort of this consciously being done, but it could also just be a part of the homeostasis of the universe.

Emery: Sure.

David: Did you ever hear anything about a solar event or the idea that we may go through some sort of rapid evolution just on a natural basis?

Emery: Yeah, not through a solar event. But I have heard of rapid ascension-type stories, but nothing to really report that I feel comfortable that is rock hard solid.

So this is kind of new for me what you're saying, and what you're saying about homeostasis. I mean, it all makes . . . Just by hearing this, I would speculate that there IS some sort of homeostasis on . . . because the universe IS alive, and we ARE still here. And we're going to be here for a long time.

And we do have good ETs out there that are working against all this, and we also have the universe.

And don't forget we ARE the universe.

David: Yeah. Well, this has been really fascinating. I want to thank both of you for being here. And I want to thank you for watching.

This is “Cosmic Disclosure” with Corey Goode, Emery Smith, and your host, David Wilcock.

Initiation Into Secret Projects Season 11 Episod 5

Cosmic Disclosure; Initiation Into Secret Projects Season 11, Episode 5

20 Jun 2018 [images blocked]

David Wilcock: Welcome to “Cosmic Disclosure”. I'm your host, David Wilcock, and I am here with Emery Smith.

Since information in these classified programs is so compartmentalized and difficult to get, how do you actually achieve a level of knowledge within the classified world?

What does it take to get a security clearance? And how do you progress through these various stages and ranks to get to the good stuff?

Emery, welcome back.

Emery Smith: Thanks, Dave.

David: So the first thing I'd like to start with is an audience question. And that is: how did you train to become a technician? What was your training? How did you get this training?

So could you please give us more information on that exactly?

Emery: Sure. And this is nothing secret or different than any other person that joins the military that picks a classification they want to go into.

I went into surgical technology. From there, you get different classifications because you can completely continue your education with the Community College of the Air Force and their technician programs, such as after basic training, which I only had to do a few weeks of because of my prior military training as a teenager.

I was immediately shipped to Sheppard Air Force Base in Wichita Falls, Texas.

And from there, I went through an extensive training of surgical technology and also surgical first assisting.

From there, you get deployed to another area, such as I was deployed to an air transportable hospital at England Air Force Base, Louisiana.

And that's one of these places where out of just a couple C-130s, we can drop down a whole hospital, have it ready to go in 24 hours anywhere in the world.

So that was my training just for the basics of the surgical technology, and that's where I learned a lot of this and trained under many great physicians.

And from there, I went to Kirtland Air Force Base in Albuquerque, New Mexico and trained through the hospital system there.

You're always in training, so you know. There's always new things coming out. There's always new techniques.

A good example of this is just doing CPR. And CPR last year and the year before . . . it keeps changing. Maybe it's a different amount of breaths or a different amount of chest compressions.

So you have to be allocated and get your CMEs accredited for doctors and nurses and all medical people. It's an ongoing, continuing education program.

So for me, it was great because I'm high energy, and I wanted to learn more and more and more. And the Air Force just kept feeding it to me.

David: So given that this was obviously very intensive training, did you also receive knowledge that would not be given to people if they went to a university?

Emery: That's absolutely correct. The things that I have learned through the military-industrial complex and the military itself – because I was doing both civilian and military work at the same time I was on active duty – the types of training and education is not available to the general public, okay? And that's because of these different types and compartmentalized programs that I was working with.

You HAD to get additional training. You had to take different courses and things with electromagnetics and sciences, even with medicine, that were not out yet.

And I've noticed that usually after five or 10 years, some of these things would go out, like harmonic scalpels. They were using that in the early '80s, and it really didn't come forward until the early '90s. and then it became mainstream.

David: In a previous episode, you mentioned that you had some kind of high school program that started you in the military.

Emery: Sure, yep.

David: So could you delineate for us: how old were you when you got into the military? And how long did it take before you started to get invited into secret

projects?

Emery: The first thing I joined was Civil Air Patrol at the age of 13. It's an auxiliary to the Air Force. It's in many, many communities. It's not a secret.

Now, during Civil Air Patrol, I also took Army ROTC. And that's just a normal thing that's in most high schools.

And so I had a really good affinity for the Army, because during the four years, I did a lot of encampments. Some of these are two weeks to a month long.

Some of the survival missions of the Civil Air Patrol could be up to a week long in very desolate areas of the world. And they teach you things, like I said, first aid and search and rescue.

So search and rescue is the biggest thing: how do you utilize an ELT, Emergency Locating Transmitting device, which is located in every aircraft in the tail section and also every boat.

David: At what point did you start to encounter information that was classified enough that it would really trip people out if they hadn't already ever heard about this before?

Emery: Probably my sophomore year. We all take these tests called the ASVAB test [Armed Services Vocational Aptitude Battery test].

David: Right.

Emery: It gives you job placement in the military. But I was getting additional ASVABs, where I had to travel to MacDill Air Force Base and take a test every weekend.

My Army ROTC commander says this is just additional things they ask for some people. And actually, I thought maybe I didn't do good on the ASVAB, but it wasn't. It actually . . . Later on, I found out that these are tests additionally they test children with to measure their consciousness and collective state.

David: So what did these tests lead to if you got positive results? Did you end up in a briefing? Did somebody hand you a stack of documents?

Emery: Nothing really was strange up until I went to England Air Force Base, my first duty assignment in Alexandria, Louisiana, right next to Fort Polk Army Base.

And then from there, it was really interesting that, “Oh, my gosh. You're now being assigned to Kirtland Air Force Base – out of nowhere.” And everybody else went somewhere else – all my other colleagues and airmen.

And THAT'S where things started taking off – when I went to Kirtland. And I had a really great feeling about this move.

So I was excited to get out of the swamp, get into the mountains in the higher atmosphere.

David: Did somebody give you like a knowing look or a wink or a pat on the shoulder?

Emery: Yeah. They treated me at Kirtland Air Force Base a lot better than they did at England Air Force Base. And I knew there was something going on, because when I went there, I immediately was in charge, directly and indirectly, of maybe 30 different technicians . . .

David: Wow!

Emery: . . . and surgical specialists, because I already had a lot of experience. And the next thing you know is when they approached me and said . . . one of the commanders there approached me and said, “Hey, we have additional things that you could work on if you want – additional trainings and additional education, if you'd like. And we would actually allow you to leave work early to do these things.” And so I did.

And some of these were just trauma training, air evac training, flight medicine, things like this.

And that's how I knew right away, “Wow! This is going to be a really great opportunity for me not only to get more ribbons but to get promoted faster and be part of other compartmentalized programs.”

And that's when they came to me and asked me, after I did another additional training, “Would you like to moonlight for this new wing of the military that has to do with harvesting organs?”

And I was, of course, more than welcome to sign that paper because I wanted, of course, to be more financially stable. You don't get paid anything in the military, as you know. And it was easy for me to . . .I had so much energy, it was easy for me to start a job at 6:00 p.m. and work to 1:00 a.m. and then get back up at 4:00 a.m. and be at work at 5:00 p.m. and do this over and over. [Emery may have meant 5:00 a.m..]

I was in great shape back then, because I was working out two hours a day, and the training alone was amazing.

And a lot of neat travel was involved with these things, having to go to different Air Force bases, like Holloman Air Force Base and White Sands Missile Range and some others that I won't talk about.

And it just opened up, I think, the area for me to slip into this compartmentalized program. And that's when I realized I was not going to be doing organ harvesting on soldiers.

David: So you described in previous episodes that the original nine months of your time doing these autopsies were kind of boring little squares or rectangles of tissue.

Emery: Correct.

David: So did anybody ever actually give you a briefing? Because a lot of the insiders I've spoken to . . . let me just say the context.

They get sat down at some point. They get shown weird films, or they get told things. Or they are given a huge stack of paper to read. And that's a commonality in a lot of these stories.

So I'm wondering, if you're getting these little squares of tissue, had you been given any of that kind of a briefing before that made you at all anticipate that this might be something weird?

Emery: It really wasn't until maybe six or nine months into the program where I started getting special classes, we'll say, and instruction that in order for you to work in a different operating room or a different area or different wing, you would have to go through these training instruction courses.

And it would cover things. And the word I did hear was “tissue other than Earth origin”.

David: They used that term?

Emery: Yes, they did.

David: Really?

Emery: And that's how I knew later on what was really taking place here. Whether it was true or not, the stuff I was working on definitely did not look like any type of

human bodily material or fluid by far.

David: Were these no-questions briefings? Or were you able to interact with someone who was telling you things?

Emery: Once every two weeks, you would get an actual briefing from a head scientist or a commander.

But most instructions – like as far as getting upgraded to go somewhere else and you have to take different courses through them, which are very short courses anywhere from two to three hours of the things that you might encounter or work on – definitely pointed into the direction of extraterrestrial genetics and DNA and tissues.

David: Well, I know when I was in college and a good friend of mine had his physics professor, the head of the department, tell him NASA KNEW we were not alone, that the Roswell crash was real, that it was common knowledge in the higher echelons, that he worked there in the 1970s.

My mind exploded with questions. I read 300 books in the last three years I was in school, so 100 books a year – two books a week – all on this kind of stuff.

I would imagine – at least if you were me – the fire of curiosity that would have been ignited in your mind, the desire to just want to interrogate: "What do you mean tissue of non-Earth origin? Where are they from? What kind of craft did they come in? What's their agenda? Are they trying to kill us? Are they trying to help us? Are they the gods that we see in the Sumerian cuneiform tablets?"

Emery: Right.

David: Did you ask these kind of questions?

Emery: Absolutely not, because I would not be part of the program if I did at that early of a stage.

David: Really?

Emery: Later on, it was a little different. They got a little bit more lax after you've been with them for three years.

Things are very more lackadaisical where the team will share with you information like, "We've heard it came from this system. We heard . . . you know, because we've seen this before with our prior notes from 10 or 20 years ago because of these different types of rivets – you know, I'm just saying for an example – or these types of

mechanics or these types of energies.

Especially frequencies was their big thing – monitoring frequencies of DNA cells, craft and all this. And THAT is how they were building their encyclopedia of all these different tissue samples, all these different extraterrestrial beings.

So it was very captivating. And, yes, for me, it was addictive. I was addicted to it. I WANTED to go to work. I WANTED to see the next thing. I WANTED to ask questions but couldn't, but hoped maybe I would be brought onto another program through working on this being, that since I worked on it and was comfortable with it, that they would show me the craft it came in, you know, things like this.

David: Did they ever make mistakes? Did they accidentally let you know something that they didn't really want you to know?

Emery: Always. Constantly.

David: Really?

Emery: Yes.

David: Like what would be a mistake?

Emery: A mistake would be to have the technicians in a meeting where the meeting was really just for the managers of that body or of that device or of that craft.

So there were many times where they cut the meeting short, and we would have to leave the room, and the people that were running that operating room or that piece of equipment or extraterrestrial autopsy would be informed of many more things of information, such as later on I found out where they came from, like what exact planet they came from, what system they came from. Are they dimensional, interdimensional? Are they the five-star, and why is that?

David: The human shape with the head, two arms, two legs.

Emery: The human shape. And if not, why aren't they five-star? Because they were maybe developed by these ETs.

There were many ETs that we found that had pets with them and extraterrestrial pets that we later coined and were trying to put a species to that . . . a separation. And they're also from the same system.

And there were actually extraterrestrials that had a species that were transporting

LARGE beings, but they were not extraterrestrials. They were like . . . We would see elephants and things like this . . . that they did not come from their system.

So maybe they were poaching these things or bringing them back or whatnot. I couldn't elaborate.

Because until you get to that level to know almost everything, you really have to be in there a very long time. And I, unfortunately, left at a very early time.

David: So let's try to delve in a little bit more to the, if you will, hierarchy of a place like Kirtland Air Force Base where things started to get interesting for you.

Obviously, you end up getting deeply enmeshed in this system of clearance, classification, access, what doors does your key card open, or whatever kind of thing it is you have there.

So could you kind of break down for us: what are the different tiers, the different levels of clearance? And could there be people on the base who have no frickin' idea what's really going on there?

Emery: Absolutely. People have to understand, too, on the base, when people are like, "Well, he's on Kirtland Air Force Base" . . . and Sandia Lab Base is on Kirtland Air Force Base. It has its own security and everything.

And all those sublevels down there are also contracted out by many different corporations of the military-industrial complex. So it's not United States Air Force doing this.

David: Right.

Emery: We're the security for that facility.

And the Army is the security for that facility on Army bases. They DO NOT KNOW ANYTHING of what's going on in there.

They know it's top secret. They know it could be harmful if any of the information got out. It could be detrimental to Americans. We could lose a HUGE rocket program just if the information got out to our enemies.

So there's different classifications of who owns these different types of levels of laboratories and whatnot and the different testing going on.

Now, getting back to what you just said, it's usually three to four months when you're

working with these types of programs, through my experience only with medical, that you would have to really stick to the rules and regulations, which are really basic at first.

You can't talk to anybody. You can't tell anybody. You're not allowed to be on any types of drugs or alcohol. You can't . . . You're tested every two weeks.

So there's like these restrictions for me at that time that it was a really great shoe-in, because I didn't have to do anything. All I had to do was show up. All I had to do was work and then leave.

And after every four months, you get one up. It's called a “one up”. And “one up” means you're going to get another security clearance if they do a report on you that you did what you're supposed to do. And background checks constantly – everything.

If you get pulled over for a speeding ticket, you best be on the phone and let them know. You have to tell them within six to eight hours if anything that you did was wrong, if you got arrested or got a speeding ticket – just little things – or if you're not getting along with your commander with your active duty job, any little things, or if you're getting harassed by active duty members, which I was getting harassed because they didn't understand why I was only working 75% of the shift. But I was being pulled into other compartmentalized programs.

They would sometimes base it off of an injury to tell the commanders, because they were really tight, but the commanders don't know. All they know is . . . like one of my buddies. He was pulled out because he spoke a couple different languages. So his excuse to work in these programs was he was a linguistics expert. So they would do these things.

And they would actually lie to my military non-commissioned officer saying, “Well, we need him because he has to decipher this because he was Polish or he was German or Russian.”

And so they were really good about getting around it. And then no one really asked after a while.

David: You brought up lying, and that made me think of something else. If you have Air Force and Army soldiers essentially working security knowing something top secret is going on but not knowing what it is, was there some type of disinformation that was planted to them to satisfy their curiosity but might not have been anywhere near as interesting as what it really was?

Emery: They would do that if they suspected someone was starting . . . you know,

someone was leaking information. Absolutely. As soon as information is leaked or they see security guards talking or inappropriate talking on the radios or cell phones or mobiles, they would immediately send out a disinformation campaign and then wrap it up by the end of the week saying, “Oh, that was just because of this, this or this.”

But then it would really get everyone's energy . . . “Oh, my goodness. This thing was there. We saw it, and it escaped.”

But no, it really didn't, because this was just someone's pet tiger that we had in there that was used for testing drugs on.

You know, these weird things would happen all the time, so they would really try to hide it.

And if there was actually a person that visualized something, then they would end up being killed.

David: So do you think that these Army and Air Force personnel had any ability to even imagine what they were actually sitting on?

Emery: No. No. They're young cadets, young soldiers, that are just waiting to get off shift so they can go work out or have a good time. They kept it like that for a good reason.

And they would not be debriefed on anything – the soldiers that were checking you in, the soldiers that were allowing you to go through the gate. Absolutely not.

David: You mentioned clearances going one up every four months. Could you give us some idea of what those clearances are? Let's get a little bit more specific about that. Like are there . . . Is it an alphanumeric code? Is there a name for it?

Emery: Yeah. I mean, there's a lot of pop culture stuff you see online – people talking about different things, people are referring to me as, “He had 'umbra classification'”, which is an old term we don't use anymore.

And now it's more like levels of, numeric levels of, Alpha 22, Beta 17. And they have a whole slew of that.

And all those refer to different types of bases and different types of work you do.

You know, I made up to level Alpha 22, and that's all I know. There was no pop culture term back then for that. I was just an A22.

David: The letters corresponded to a particular base?

Emery: To a particular unit within the base.

David: Oh!

Emery: So there might be energy testing, aircraft testing, biological testing, all these different things. And the first letter doesn't mean anything. It's just a letter that when you came in, this is where your program is. And it can change.

It actually could change to a different letter and different number if you got transferred to another base or a different project.

For me, I was pretty consolidated because all my stuff was medical, and I kind of stayed with that.

I did get to work on some aircraft, but more like taking specimens from aircraft, not learning the propulsion systems of those aircraft.

David: So an A22 in one base could be completely different than an A22 in another base.

Emery: No, it's standard in North America.

David: Oh, it is?

Emery: Yeah. It's different than Europe and Australia. They have their own thing. But you would have clinicians, physicians, and extraterrestrials in your base that were from these bases. And they had different markings and different codes and names.

David: So would you wear something that said “A22”?

Emery: No. No. It's on your band.

David: Right.

Emery: Remember the band?

David: You mentioned the band before.

Emery: Everything's on the band.

David: So they might not want other people on the base to know what your rank is.

Emery: No! That's a really bad thing because you could trick someone into telling you something if they thought you were classified.

David: Oh!

Emery: Yes, and that would be really bad, and that has happened.

David: Wow!

Emery: And they have . . . Yeah, they didn't make it.

David: What you're describing here is so seemingly fantastic that for most people watching the show, this would be only approachable as science fiction.

Maybe they want to believe you, but something holds them back from really accepting that this is true.

Now for me, the scope of what you're saying, the complexity of what you're saying, that's when I know somebody is real, because you can't make that up. It's too dense.

What you're talking about here . . . clearly you're giving up some things. You're sacrificing some things.

You're sacrificing the ability to talk to people about this. You can't even have friends. Like, you don't get to ask questions.

So could you explain some of the sacrifices that you've been through in this amazing environment?

Emery: The technology that I was working on and the different projects that I was included in can cure the world's water problem. It can clean up Fukushima in seven days. It can get all that trash off the coast of China, Japan – hundreds of acres of this stuff.

And personally, myself with my family coming down with cancer, let's say – my mother. This could have all been avoided if they would just release this information.

So I came to a point after working on zero-point energy devices and getting one to actually operate and getting it validated by a few laboratories that my life started getting threatened. And it wasn't because of the extraterrestrial stuff.

It was because I was possibly . . . they thought maybe I was going to bring something out to the public without the knowledge of them.

So I'm very compassionate about getting this stuff out. And I really thought and feel that my life is in a little bit of danger with all the threats going on and the phone calls and the constant harassment. You can't have a normal life like this.

Your family is at jeopardy. Your wife is at jeopardy. Your friends are at jeopardy. People don't want to be associated with you.

My colleagues through many of my major corporations turned on me because they didn't want to . . . even though I'm a 50% owner of a corporation, they just stood back and said, "We don't want this to reflect on the corporation's belief system" – that extraterrestrials exist and zero-point energy and all these crazy things . . . unless they're making billions of dollars off it.

So it shows that they're just so non-integrous people that are looking at just to make money off certain things and don't want anything to do with it.

And there's people that are just . . . They feel that if they're associated with me that they . . . you know, their lives would put at risk.

So it's a lot of weight to carry on your shoulders, but I'm not stopping just because someone's harassing me or someone's trying to kill me.

I get all these remarks online. There's a couple of people that don't agree. You don't have to agree. I'm not telling you to agree.

I'm telling you my story. I'm telling it truthfully, and I'm telling you: go out for yourself and find out, because it's the only way you're really going to believe it. And that's what I did.

David: Well, I want to thank you for your bravery in coming forward like this.

Something flashed in my head as you were talking, and that is going back to the base, and we were talking about sacrifices.

I'm curious if there was ever a scene where, for example, a guy comes up to you, and he really shouldn't be talking to you. And he's all nervous, and he's looking around. And he's telling you something that he shouldn't.

Did something like that ever happen, or was it so locked down that it was impossible?

Emery: Well, after being in there over many years, people do start to open up. We start knowing, okay, this person has been here this long. They obviously are not going

to say the wrong thing, or they'll be able to hold a secret.

And you're still not allowed to fraternize with anybody from any . . . You know, you can't be a friend of someone. You can't date someone in this lab. It's really that strict.

David: Well, Emery, I really want to thank you for what you're doing here. The promise of where this technology can take us as a world I think makes it worth it for both of us to put our lives on the line for this show.

And I want to thank you for watching. This is “Cosmic Disclosure” with David Wilcock and our guest, Emery Smith.

Dire Consequences of Breaching Security Season 11, Episode 6

Cosmic Disclosure; Dire Consequences of Breaching Security Season 11, Episode 6

DAVID WILCOCK: Welcome to "Cosmic Disclosure." I'm your host, David Wilcock. And I'm here with our guest, Emery Smith. Emery, welcome back.

EMERY SMITH: Hi, Dave. Thanks for having me again.

DAVID: In a previous episode, we were discussing some kinds of things that might happen where perhaps somebody is shifty and nervous, and they're looking around. And they come up to you and they say, there's something I really want you to know. But I don't know if I should tell you. And I asked you, did that ever happen? And what was your answer? Let's just review that first.

SMITH: There is something similar to that. It doesn't usually happen that way. It usually happens after someone's been in a project for a very, very long time, longer than you have, even. And they see that you've been in there a long time. So they know that you're doing something right because you're still there. And at the lunch table, you might be sharing some information. You might become friends, which you're not allowed to become friends with anyone, even inside these compartmentalized programs or outside. But it does happen. And I did have friends.

DAVID: Well, now, wait a minute. On a typical military uniform, there's a name, like in the Army or the Marines. Do you have names on your uniforms in there?

SMITH: No, no. There's no names. You only have the band.

DAVID: So are you allowed to tell people what your name is, or is it even--

SMITH: Yes. You're allowed to have casual conversation, they say. So people talk about their families, what they did over the weekend, common things you hear normal people talk about--movies and TV shows and funny jokes, of course. A lot of jokes are said during lunch that people come up with that also reflect on some of the projects that we work on. But it doesn't talk about the project, so it's OK.

DAVID: So you could get to know somebody by name and remember their name and talk to them. Did you also have outside the cafeteria any recreational areas that you would hang out with these people in?

SMITH: Well, not recreational areas. But I became friends with a lot of the commanders and a lot of scientists that were in the same projects. And I did illegally

meet with these scientists and people for social gatherings, dinners, and barbecues. You think because it's your commander inviting you to the barbecue that--and he's been in it for 10, 20 years more than you--that everything's going to be all right, right? And that's not the fact. That is not a fact--that it's not all right. And they put these in place--these rules--so these things don't happen and that the information does not fall into the wrong hands. And one of the commanders on one of the projects I was working on I became really close with--a really good friend of mine. And we'd go mountain biking together. We had motorcycles. Just one of my buddies, you know?

DAVID: Were you allowed to have a mountain biking expedition with the commander off base? Or is that not--

SMITH: No. You're not allowed to. Absolutely not. I remember visiting him and his wife and my girlfriend and I many times out to eat and things. And we would never really talk about anything to do on the base. We were really good about that. But during our lunch hours and during other hours of trainings in these underground facilities, you do talk sometimes. People slip up and start talking about things. And one of the things he mentioned to me was this amazing craft that he was going to get me involved with possibly to work on and to actually try out the flight simulator of an alien reproduction vehicle.

DAVID: Really?

SMITH: Yeah.

DAVID: Now, had you ever gotten to see any craft before this point?

SMITH: Yes. I did see a craft before this point but not to this extent. And they were not alien reproduction vehicles.

DAVID: Now, what is an alien reproduction vehicle for those who don't know?

SMITH: When we have craft that we find or unearth or shoot down or collect from space junk or collect from some other place in space, it's brought to these facilities. And they basically try to reverse engineer these craft to the best that they can of their abilities.

DAVID: So this commander buddy of yours--sounds like you guys had really gotten close. You're going mountain biking with him. You're having dinner with his family. Did you guys get chipped? Could they have GPSed you and know that you were having dinner with this guy?

SMITH: No. Not that I was aware of. I actually got caught with the commander in a location that I was not authorized to be in because of my clearance. And everything

went to hell in a hand bag after that.

DAVID: Well, this is a story you told me many years ago. So let's unpack this a little bit. Where were you with the commander when he first told you about this? And what did he say you might be able to see?

SMITH: There was a actual extraterrestrial craft that they had captured and brought into one of the underground hangar operating rooms--the whole vacuumed one. And inside that, they were duplicating it in the same room, trying to reverse engineer the craft. So they started with the inside of the craft. So it was kind of like the craft was opened up, and you could cut it in half. And it was a diamond-shaped craft, and it wasn't that big. It was probably no bigger than an 18 wheeler.

DAVID: So when you say diamond-shaped, could you be more precise about what that means? What would it actually look like if you had to draw it?

SMITH: Like a piece of fluorite. It's an octahedron.

DAVID: A pyramid on top, pyramid on the bottom.

SMITH: Correct. That's right, but laying down. So the points are out, not up and down. So it's laying this way and balancing itself perfectly. So they made this. They were trying to do that.

DAVID: And you said it's about the size of an 18 wheeler?

SMITH: Yeah. It's really small.

DAVID: And what was the color?

SMITH: It was gold. It actually had a light to it--a very nice light, like these lights are on us on our face.

DAVID: So it glowed?

SMITH: Very subtle. Very subtle. And it had a very metallic surface. So it would reflect light if you shined light on it.

DAVID: Seamless again?

SMITH: Seamless, except for the edges of the octahedron.

DAVID: But you said it had already been dissected or something.

SMITH: Well, no. The craft that they were making next to it was just--they were

trying to find out how it works and how it flies around. And they were doing a lot of stuff with the actual electromagnetics of it. So they duplicated a half version. They cross sectioned a man-made half version.

DAVID: Like just half of the octahedron? You could cut it down the middle?

SMITH: Yes, exactly.

DAVID: OK. How did you get there if you're not cleared to be there? If you're not authorized to be there, how in the world would you get into that room?

SMITH: There is a stipulation if you're escorted by someone of high authority. And a lot of the times, for emergency reasons, you have to go to certain places really quick. And as long if you're with someone that has a clearance higher than you, then the responsibility falls under that person for legal issues and for everything. But everyone knows that if you're not read into a project, it's very unlikely you would go see something without knowing everything about it. And I was not read into the project. I was read into the project clandestinely through my friend.

DAVID: Walk us through what happens.

SMITH: So we got down to this floor. The door slides open. And we walk down a hallway around maybe 100 feet or so. And there's another normal vacuum door that we would see that slides open, just like you see regular elevator doors that slide open. But these are very thick doors--extremely thick, about 24 inches thick. Once these doors open, there's a platform. This platform goes another maybe 30 feet with railings. And it completely drops down to an abyss that you cannot see the bottom of. And the walls are completely covered in rock, just like you would see in a cavern--just pure solid rock walls. And that--the room I'm about to go across this catwalk--is a dome room that the craft is in. So you have all these different bridges going to this self-suspended operating, pressurized, giant room.

DAVID: So you had to get through these 24-inch thick blast doors just to get to the catwalk through the cave before you get to the dome part.

SMITH: Yes, exactly. It's very secured, for sure. And I don't know why they have this room suspended away from walls maybe a hundred feet. So you have this giant room now. You're walking into it with multiple catwalks from other doors that go into it. And then you come there, and the same thing. These doors open up--the same doors that you just saw, another 24 inches. And now you're in the bay. And that's where the two craft were.

DAVID: Describe now what you see and how do you approach it.

SMITH: It's a large, round room with a dome top that goes very high. I don't know exactly how high--at least a few hundred feet. And the floor is completely mirrored in a metallic, mirror-type tile. And the tilings are in a hexagonal shape. And they're very large tiles. They're maybe six feet--these hexagon tiles. I don't know if they're used for electromagnetic. There might be something under there. I was thinking maybe they used it to shoot frequencies up to this thing because both craft are now touching the ground. But these things weigh a couple kilotons. So obviously, something is supporting them unnaturally that we're not used to having here on Earth--some sort of anti-gravity. One of the craft is the original, of course. We talked about this. And then the second one is just for instructors to learn how to fly this craft.

DAVID: What was your experience? Were you afraid to talk and to say how awesome this looked? Did you say anything to the commander?

SMITH: Yes, I did say it. I said, this is amazing. This is awesome. Thank you for allowing me to be part of this project. I really just thought this is my first introduction maybe to this. And now I'm maybe going to be part of this in some way or another.

DAVID: I'm really curious about this flight simulator system. Could you go into a little bit more detail about what is the actual experience. Are you seeing stars? And do you zoom around Jupiter and Saturn in the simulator? What do you actually do?

SMITH: Exactly. It's a complete description of 3D reality of the entire planet and the oceans.

DAVID: Of this planet.

SMITH: Of this planet. It doesn't show anything going off planet, by the way--nothing further than the moon, I mean. But other than that, they have complete simulations of the moon structures, also inside the moon. The coolest thing was the oceans here. It's things you would never have seen before. And whether that's just written as a program, I don't believe so. I think it's an exact replica of stuff they already know about. So just imagine plugging into Google Earth times 1,000 with some virtual reality glasses and being able to go anywhere.

DAVID: What was cool about the oceans?

SMITH: Well, the oceans--we only know what the oceans just from Google Earth and what we've learned from the encyclopedias. Not many people can get into a sub and explore the oceans. And we know more about our own space than we do our own oceans, and everyone knows that. And the seat is actually part of the craft. So there's not like a chair. It's actually molded. I'll say a mold of a seat. And in that in front of that is this huge dashboard. And this dashboard has many screens in it. It has many holographic images. It has joysticks but made for your hand. Your hand slips in them.

So imagine a reverse glove, I guess, where you're putting your hands into this glove area. And your palms fit nicely on a smooth ball surface. And that is what turns everything on. So he was beginning to teach me how to fly the craft.

DAVID: So you got to sit in this cockpit?

SMITH: I flew the craft.

DAVID: Inside the dome?

SMITH: No. I mean, this was a simulator. That's why it had a big screen in it. They were trying to reverse engineer the seat and some of the things they've seen in there. And then this was fake. This was a big screen. It's a simulator of that craft. So they were training clandestine pilots how to use this craft with these balls things that your hands slide into. And it's a very comfortable seat, by the way.

DAVID: Would this morph for your body? Or was it just a nice, comfortable shape?

SMITH: It felt very--it was very plasticity. It didn't contour to your body. It didn't morph to you, but it did give way. So your elbows and everything--you had to be sitting in a certain position. And it's kind of reclined a little bit. And you're sitting back like this with your hands in these weird--which is part of the seat, by the way--the gloves. Don't think of gloves, everyone. Think of just holes in the seat that your hands perfectly fit on these balls that are in there. And after going into the simulator for a number of hours--at least three or four hours--I just remember hearing that horrible sound of the doors opening because everything echoes in there. You hear everyone's conversation--everything. There's no carpet or anything. You can hear a pin drop from 100 feet away. And it's just this dead, beautiful silence and just our voices. And then when the doors open, they have this very interesting sound. It sounds like a--if you ever had a piece of plastic. I always refer to X-rays because you know how the X-ray paper is? And you shake it, and it goes rah rah rah rah rah. Well, these doors do that. They just come right open. And they have this rah rah rah rah rah rah--this really weird vibrational noise that's just not common to hear on a mechanical door, I'll say. And when I heard that, I looked at him. And I said, oh, are there other people coming? He says, no. No one is allowed to be here right now. And that's when the suits came up.

DAVID: What do you mean by suits, exactly?

SMITH: I was figuring on him being the ultimate commander here being in charge of anything. No one's higher than him. So how are any security going to say anything about this? Because I legitimately thought this was OK. And it was not. And these suits are people in black suits. This is not a clean area, by the way. So you don't have to have your space suits in here. This is what we call a "dirty area." So you can just be

in your uniform there. And these suits came in, four--

DAVID: Are we talking suit and tie?

SMITH: Yeah, suit and tie, four or five of them. They were all taller than me and bigger than me.

DAVID: Are we talking men in black, like with the hat and sunglasses?

SMITH: No. No hats or sunglasses. Just a normal, big guy, but very professional. Not security either, but they could be. And I just remember them grabbing him by the arms and just pulling him away of the thing. And then they told me to get out of the chair, and I just got the chair. And they put my hands behind me and zip tied me and blindfolded me. And that's the last time I ever saw him.

DAVID: Really. In your whole life?

SMITH: Yes.

DAVID: OK. Walk us through this now. I know this part is very painful, but tell us. So you have some kind of bag put over your head. You're zip tied. How long was it before you got into the room? What did you experience along the way? Was it in a vehicle?

SMITH: It was a long walk. I was in three different elevators. It was a very long walk, and I was trying to trace my steps to where they were taking me. But then they put me on one of these electric ground cars that they have. And they're very small, but they can hold four people. But think of it as a toboggan-type thing but double the size. And they were talking in a different language that I do not know. Last thing I remember--

DAVID: It didn't sound like any Earth language you're familiar with?

SMITH: No. No. I thought maybe it was maybe Navajo or some other Indian language. It sounded just an off beat of Navajo language. I know a little bit of that from living in New Mexico, but I didn't understand it. And they spoke it very fluently. And they would break in and out talking in English to me.

DAVID: Did these people look like they were from Earth otherwise?

SMITH: They were genetically modified humans for sure. Somehow they were genetically modified because they were just a little bit too large. They all looked a little bit too similar. And they were very professional and smart and very, very strong.

DAVID: What type of race of people on Earth would they be?

SMITH: They were white. Their race was white. They had blue eyes. They had different colored hair. They were dressed very nicely.

DAVID: And extremely muscular?

SMITH: Extremely muscular and large.

DAVID: OK. So this is intimidating right off the bat.

SMITH: I was scared, very much so.

DAVID: Were they carrying anything like a weapon or something on them when you first saw them?

SMITH: No, not at all. But they were forcefully handling me. And I was being very compliant, but they were still handling me very forcefully.

DAVID: And what happens next?

SMITH: They take me out of this vehicle into a small room. I ended up did getting my blindfold taken off at the end. That's why I can describe it ahead of time. But I was blindfolded. I had my uh--arms were zip tied behind me. And they told me to sit down in a chair. And there's three chairs and a table in a 10-foot room. And I was struck in the back of the head numerous times in the neck and also in the stomach by some sort of instrument, like a baton maybe or something. And I did go unconscious. I was bleeding from the back of my head, but nothing on my face. They then sat down and decided to ask me a lot of questions. And they were asking me questions of how long did I know about the project, what did he tell me. I admitted to having a friendship with him on the outside with his family, which they already kind of knew. But we never talked about any of that. I asked if I could get some medical attention because I felt like I was losing a lot of blood. And a person was brought in. And they basically just applied some direct pressure to me. And they told me to go home and that they would contact me.

DAVID: Did you have contusions or a concussion afterwards?

SMITH: Yeah. I had a concussion and a big hematoma on the back of my head. I was petrified to go report it. I thought maybe that would--and I think they were testing. I thought that was the next test. And it was because I didn't say anything. And that's how I got my job back--because I was able to keep a secret. And the secret hurt me.

DAVID: What is it like to be in that place where you feel completely powerless, you're handcuffed, you can't see anything, and you're just getting savagely beaten? What was going through your mind? Did you think they were going to kill you?

SMITH: Yeah, I just thought this was it. I wasn't even saying anything because I knew what the contract is. And you don't mess up the contract. And even though I was misled, I didn't know that it was a--because it's a very touchy situation. It was such a touchy situation, because did Smith do this intentionally? Was he intentionally trying to do harm to the facility? Obviously, he was escorted to places that he didn't have clearances through someone that had a higher clearance, which is allowed at certain times. But not at this time. This was not--I guess this did not correlate with whoever is really running this. He did not probably report--maybe he did have to report to someone. He has never told me. I didn't see it this way. This was definitely civilian compartmentalized with military leaders that were in there. Did I do something wrong? All I know is I did something wrong. I figured, well, obviously, I'm here in a really bad situation right now. I'm going to be killed probably, and that's it. So I was accepting that. I mean, I was broken down enough until they took the blindfolds off. And I just remember looking up at them. And they just said never to repeat this again. And if you say anything or do anything, you know what happens. And I just knew at that point, well, I'm not going to die. Why would he be talking to me? Why would he looking up at me as I'm looking up say this to me and giving me, obviously, another chance? So I was sent home. They said, we will contact you. Do not come to work tomorrow. And I did not want to go home because that must mean I won't be coming back. That's what I thought. But then I thought, well--

DAVID: How did you get home if you were in an unfamiliar part of the base?

SMITH: Oh, no. They escorted me out. I was already back to my area. That's what all that driving and going up and down--they did take a DNA sample from me--a cheek swab. And they took blood from me, which is normal when things go weird. I've heard this before--that they do this to anyone that's caught in other areas. And I was restricted from ever trying to contact him or his family ever again "for the duration of my life on Earth," quote unquote.

DAVID: Wow. So then you went home the normal way that you would have from your work.

SMITH: Yes, with no delay. Nothing. I literally was so freaked out. I really thought I lost everything. I thought I lost my career and my job with them. I've heard so many horrific stories of this happening to other people. I thought it would never happen to me because I played by the rules. And this rule they didn't like. They didn't like what had happened. And the last thing they were saying was just to go home. We'll contact you. So I thought I was out of a job. I thought I'd lost all my clearances. I thought everything was just going to go down the tubes for me. I thought even my career with the military--I thought this would affect it somehow. And that's when I did go home. And I still went to work the next day for my military job. And then a day--

DAVID: The cover job.

SMITH: The cover job. And then a day after, I got curious and went on my mountain bike and wanted to do a little investigation of my own to go around the mountain up there by this place where we talked about how the commander had alluded to some amazing things going on up there. If anyone looks on Google on Kirtland Air Force Base or if you're flying over to land at ABQ, everyone knows about the mountains hollowed out there. And there's these giant doors in the mountain where they used to keep all the nuclear warheads back in the early days. And now they're used for storing other things. And he did mention this--the commander--to me during one of our excursions. And I knew that there was something going on up there, but I didn't really have the clearance to be in or near that facility. However, since I'm active duty member, there is a bike trail that goes all the way around that facility. There's also four or five fences, guard dogs, and MPs at all the entrances going into the area of the mountains. And those service roads is what I use to mountain bike a couple of times a week. But I was young and curious. And I thought maybe if I go up there I might be able to catch a glimpse of something and see what's going on coming in and out. Also, using special goggles and stuff, you can see different energy fluctuations that I was issued at that time. Anyway, so I went around. And I was mountain biking around this facility and probably looking at the facility more than looking at my bike trail, I presume. And three-quarters of the way around, I became deathly ill. I felt like I was getting nuked from the inside out. And I still had another eight miles to go back to my barracks. And I did make it back. And when I made it back, I curled up into a ball and I prayed to God to just kill me because it was the most excruciating pain I've ever had.

DAVID: So what do you think happened to you based on what you know now?

SMITH: I think that was a scalar weapon. It felt like your entire insides are on fire and you cannot do anything to make the pain go away. You go into the fetus position. And it feels like someone is just getting your insides and just twisting them up and lighting them on fire. And it was just so horrific that I went unconscious and possibly could have maybe died at that point.

DAVID: So just so we're clear, do you think there's some sort of emitter, like a beam weapon, that they pointed at you while you were riding your bike?

SMITH: Sure. Later on, I found out they do have scalar technology that's all pinpointed. They could do it right through the Earth here and hit someone in China--just that person--and neutralize them. Spontaneous human combustion--no. It's not that. It's these types of weapons that they use. So these things do happen.

DAVID: So did you wipe out on your bicycle when they hit you with this?

SMITH: No. I just slowly started getting worse, worse, worse and worse and worse

and worse as I'm coming down the mountain. And I made it. I should have just went to the hospital or something, but I kind of knew where I was. And I've heard of these stories. They were just myths amongst the people that worked there. But I didn't really know know. Now I know.

DAVID: Now, you told me before that as a result of getting zapped with this that you had a post-traumatic stress disorder that developed.

SMITH: Yeah.

DAVID: Could you explain a little bit about what that is? What happened?

SMITH: Well, any time I get any type of weird feeling from energies or something, it could trigger me. Certain situations in life--that might trigger me. You just go into an anxiety panic mode. You might not remember what had happened the last hour or so. You can even blackout sometimes. I've actually just shut down and woke up in the bed going, wow. That was pretty intense.

DAVID: So you're lying in bed now. You've had head wounds recently. You said you had a hematoma. You had a concussion. Now you've had this outrageous directed energy weapon attack. At this point, did you know if you were ever going to be able to work again? What was going through your mind?

SMITH: It wasn't until the day after when I woke up from being unconscious just in my barracks from this beam weapon that I had a message. And it was to report to duty at this time. And I did. Once again, I did meet with three people. But these were not those guys in the suits. These were the people I always work with. And they just said, don't let that happen again. And I said, I won't. And that was it. I got my job back.

DAVID: How did this event change you in terms of how--because you said you were very enthusiastic about your job. You felt like you were in an amusement park almost--an alien amusement park. How did this change that?

SMITH: There was some sort of continuity breakdown, I thought. And I just didn't believe in them any more. I didn't believe in the structure. Who the heck is behind this? Who is pulling the cords? Who is really running this show down here? Who were those guys in the black suits? I started getting mad, like going mad. I was trying to figure it out for myself, and now I can't even talk to anybody about it. I can't even--to my own coworkers I can't say anything.

DAVID: I know you can't get too specific. But where would this commander be in the US military hierarchy let's say in relationship to the Joint Chiefs of Staff, who report to the President of the United States and are the heads of each branch of the military. Where would he be in that relationship?

SMITH: It's all based on clearance. You can be a captain and have the same clearance as a general or a colonel. You can be a sergeant and have the same clearance as a captain or a colonel. Remember, it's the duties that you perform and what is needed to get the job done. It's not about the--they don't use the military system of rank for these positions. They use the knowledge base and educational base of the people that are put in place to run these projects.

DAVID: So as far as you knew then, it's not like this commander might be a member of the Joint Chiefs of Staff or some big head wig in the military. But within your classified ecosystem, he was almost as high as it could get for your information.

SMITH: He was the highest.

DAVID: He was the highest?

SMITH: The highest that I knew in my area. And I didn't think there was anyone higher that had more clearances to go anywhere in that base.

DAVID: Wow. And he never gave you the impression that there was anybody like that?

SMITH: No.

DAVID: Wow. Well, this is quite a story. Tragic, but also I think very revealing of the sacrifices that you have had to make to get to where you are today to tell us this information. How do you feel to finally have this story be shared with the world at this point?

SMITH: I just want everyone to know what's really going on. And I want it off my shoulders so other people can come forward and share and for them to feel--because I know they're in pain, too. It's a hard thing to grasp and to understand unless you've actually been there. And I know there's a lot more Emerys out there like myself. And they just need a little maybe help from an interview like this to get them to come out and join us to let the people know they have the right to know about all these amazing things that are going on down there that can help humanity. And at the same time, where is all of that money going for taxes that we pay and things like this? There's a lot of corruption. Even though these things sound cool to some people, like sci-fi movies, it's not. It should be something that is frowned upon. And the goodness should come out of it, not the bad parts.

DAVID: Well, I want to thank you for stepping forward. And I hope that we do get more of those insiders. And I want to thank you for watching. This is "Cosmic Disclosure." I'm your host, David Wilcock, here with our guest, Emery Smith.

ET Coworkers Season 11 Episod 7

Cosmic Disclosure; ET Coworkers Season 11, Episode 7

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. And we are here with our guest, Emery Smith. This episode we're going to be discussing extraterrestrial coworkers. Emery, welcome back to the show.

EMERY SMITH: Thanks, Dave, for having me.

DAVID: I didn't realize, actually, that you were in some cases working on these autopsies with people who were not of Earth origin. So could you start to lay out for us under what circumstances you might have someone in the OR with you who is a completely separate type of person than what we're used to here on Earth?

SMITH: First I would like to start off by saying, not all extraterrestrials are 100% of not human genetic DNA. We have an Arcturian that's only 75% Arcturian, and maybe 10% Pleiadian, and another, the residual of that, human. So for the most part, most extraterrestrians actually have our same human DNA. It's just that over millions of years they have been intertwining and getting new types of genetic formations by mixing different DNAs and different types of extraterrestrials.

DAVID: So is the theory that there are actual travels going on and interbreeding in ancient past?

SMITH: Exactly. And the past also is the future. So you have to think that these extraterrestrials are a few million years ahead of us, actually were us at one time. So it's actually some of our DNA in there--our children's children's children's children's DNA could be possibly part of the extraterrestrial that we are seeing today because they have already mastered time travel and portal travel and things like this. So the time is, you can't really say the time because time really doesn't exist. But these extraterrestrials did have descendants that were from Earth.

DAVID: OK, so you mentioned an Arcturian who might also have some human genetics. If we saw this Arcturian what would it look like?

SMITH: Well, there's many different types of Arcturians just like there's many different types of humans on planet Earth.

DAVID: OK.

SMITH: Some of the Arcturians that I worked with do look very human like, but they're a lot more robust. And they're larger, some are seven to eight feet tall.

DAVID: Really?

SMITH: Some are actually of really ancient descent, which their genetics have not changed over time, which they did not intermingle with other extraterrestrials. And some of those actually looked like a rock formation, like that--one of those superheroes that's made out of the rock you see on TV and--

DAVID: Like in "The Fantastic Four."

SMITH: Like "The Fantastic Four." And they don't--they look like they're hard and rock, but they're not. They actually have a spongy type feel to them, kind of like an actual sea sponge where it's very porous material. They are usually a gold or an orange type color. And they are very robust with a large Cro-Magnon type skull, which is a little bit--about twice the size of our heads and a lot, like I said, more robust looking. And they have been spotted on the projects many time in many different ways. And then there are Arcturians that are actually more human looking, which just have a very robust muscular looking body-builder type look to them, but a lot more Cro-Magnon as far as the skull features. And the bones are about three times as dense as a human's.

DAVID: Wow. So let's take this discussion of the operating room a little farther. For some reason when you and I talked about this years ago, I was under the impression that you just went in there by yourself. You did the autopsy by yourself. You had some people speaking to you through the intercom and that was it. But it doesn't sound like that now based on some of the things we've been talking about.

SMITH: The first year was like that, until I got higher classification and security clearance. After that I was brought into what they call multi-level projects, which means it's not just me going in there harvesting a piece of tissue. But you're actually harvesting many different kinds of tissue and also working with the being's craft. So these projects could have up to three teams of 15 scientists and physicians and technicians working on just one being and one craft.

DAVID: Really?

SMITH: And some of those scientists and physicians are actually of un-Earth origin, this is the term they use, which are extraterrestrials. Which have volunteered either after being captured or volunteered through the system, through the compartmentalized program, to work to actually help us. Because they kind of actually feel bad sometimes, even after we capture them and beat the heck out of them and do horrible things to them. They actually turn around and willingly want to help us and stay with us and teach them about their own physiological phenotypes, about their own race.

DAVID: Would you say that these extraterrestrials are benevolent?

SMITH: Yes. I would say they're benevolent. I would say they're a very humanitarian type of thought process. They're a lot smarter than us. They could actually at any time probably do damage to us or hurt us with their telekinesis and telepathic abilities, but they don't.

DAVID: So, there you are in an operating room. And you're saying that in some of these cases, you might have an extraterrestrial and a craft. And you're working on both at the same time.

SMITH: They usually keep the extraterrestrials and the craft separate. So you might have a bay not too far away, maybe within 300 meters--which is very close, by the way, because these things are so spread out underground, you know up to 10 miles in diameter some of these bases. And you will have the being, the being is separate. And then you'll have the craft in another bay. These are all very clean areas, which I can describe in detail. And I might be actually assisting an extraterrestrial, helping complete the mission, whatever the mission is--gathering frequencies using devices, or gathering tissue samples, or running special tests of the bodies, which actually they can scan the whole body and 3D print that body later on.

DAVID: Hm. So could you give us some examples now of what kind of being might you actually see as a coworker in the operating room with you? Just start to go through--

SMITH: Sure. Like, some of the first ones I want to go over are like the beings that are monkey like, human.

DAVID: OK.

SMITH: And their pelvises are not spread out like a monkey, by the way. They all stand very erect like we do. But they have the formation of, you know, a monkey's look, with longer hair and the face is more pronounced like a human without a snout. And--

DAVID: So it's not necessarily like "Planet of the Apes," but they're still more of an ape-like appearance than us?

SMITH: Very ape-like appearance but more human like. And not that much fur on the face, by the way, just around it and around the body. And they speak very well. They have great vocal cords. They have a problem, though, with high pitch sounds. So they have to wear special things in their ear when we work with them that actually tones down the sound of just our own voice. And of course they pick up on different frequencies from electromagnetic fields and TVs and computers. There's these high

pitched sounds they give off that really distorts them and allows them to come actually ill if they don't have these protective ear plugs in.

DAVID: This is a bizarre thing because one of the groups that Pete Peterson told me about was a simian group that he called Simulacs. And in that case they had genetically modified their hands so that their fingers were actually these prehensile tail like things. They had done some genetic modification on themselves.

SMITH: Yes, I've seen a lot of genetic modification on humans and extraterrestrials for different projects that were not normal from their lineage. And I did notice a couple of these in and out very rarely, but they do come about. And you know, we don't get to sometimes, of course, sit down and have lunch with these beings and talk unless we're actually working closely with them. But the people that look like these monkeys and apes that stand very erect also do not have that thumb that sticks out like on a gorilla. It actually can actually grasp stuff. Their hands are also not large and bulky like you would see as an ape. That's actually a thinner, longer fingers, and a very broad palm. So great operating thumb.

DAVID: Do we know where these ape-like people originated from? Did you get any briefings on their system or anything like that?

SMITH: I believe these come from multiple systems, including Arcturus and Sirius and Spica, that area of space. And because the genetic lineage of DNA that I was reading in the library at the time did pinpoint a lot of these ape-like human beings from these systems, that they all had similar genetics from each system. So you might have one that's mixed with other ET systems. But all the DNA was the same. I mean, the same meaning they had all the same ape DNA, whether it be 30% or 90%.

DAVID: Mm. So what is their agenda here?

SMITH: Yeah, there's obviously something going on behind the scenes that I'm not privy to know. But what I believe is that these beings that we either caught or captured or volunteered to come here that are working with either the government or the military or the Cabal on different occasions for different projects, are strictly humanitarian. And they don't have any agenda at all. And they could probably easily take out a lot of people if they really wanted to but they don't have that feeling. Being next to one of these extraterrestrials, by the way, including the Ant people and the Mantis people, you have a really beautiful self feeling being in their energy fields. And people have actually had miraculous healings by being on these craft and working on the craft and working just in the vicinity of an extraterrestrial.

DAVID: How does that work?

SMITH: I do not know how that works. I think it's electromagnetic of some frequency

that allows the body, their body that already generates a very, very high vibration, it actually brings our vibration up so our cells are running at a specific voltage so our own cells can heal ourself.

DAVID: Interesting. OK, so you also mentioned Ant people and Mantis people. So could you walk through for us what that would be like? You said it was enjoyable to be around them. I think most people, without a lot of vetting and preparation, would be extremely frightened if they saw an adult human sized insect that appeared to be intelligent standing in front of them.

SMITH: Yes. I don't have fear of any ETs, and I've seen some really gross disgusting looking things, that people would probably just associate with pop culture or just, you know, things that we don't like to see. Such as, we have an inner emotion just by seeing the color red, blood, which is an emergency color for us. And you have to understand that these ETs do not see just like we do in just our normal color spectrum. Some of these ETs see in variable, many variable colors, spectrums of light. Which means they can see things we can't see, even X-ray vision for some of them. Some of them have special coatings on their eyes. Like some of the reptilian forms have three different layers that they can put on their eyes to see in different light spectrums at will. Some of the Ant people also have this amazing ability to see through things and to hear things that we can't hear and to actually look into you and can tell if there's something wrong with you, if you have a disease or whatnot.

DAVID: Like X-ray vision.

SMITH: Yeah, like X-ray vision, a kind of light spectrum that we're not aware of yet here on Earth because alls we have is the eyes of all the animals here that we've studied for our entire lifetime and humans. But it's completely different. Some of them actually have to wear goggles just to live here and to be here because the light is too much. It actually enhances light. They come from places where there's complete darkness for a human, that we would not even see--darker, dark as a black hole. But they can see things.

DAVID: So let's stop on the Ant people for a second. Can you recall an example of an autopsy you were working on where you were assisted by an Ant person? And just walk us through what that was, what happened.

SMITH: Well the interesting thing about these autopsies, too, is you have to understand there's different types of suits that we use, of course, for different types of races. So an extraterrestrial ant person suit does not look like my suit that I work with in the operating room at all. And these are self-contained atmospheres. And some of these extraterrestrials have to have a special atmosphere, or a vacuum, for them to actually work here on the planet. And they also look a lot different than we do as far

as the body. The Ant people have these very, very thin but very strong arms and legs. And you're looking at them because it's basically 75% thinner than our own femurs, but yet incredibly more durable than our femurs. And then you have the robust body that could be segmented or non-segmented depending on where they're from. And then you have the face. And a lot of people do comment on the face. They could have a double mouth or pinchers on the face, and a lot of tentacles, and a lot of little things coming out of their face that kind of might look a little gruesome. You might hear one speak. They have special voice box analyzers that come on their neck and in their ears, sometimes in their mouth, that translates into a human language, whether it be English or Russian. And they talk multiple languages through these things. And it does sound not like our voices. It's a little more higher pitch actually. And the screeching of that sometimes is upsetting to some people, and could be maybe a little scary on your first visit in one of these extraterrestrials, especially when you see their mouths open and you can see all the layers inside. Which is just a normal thing. You know, it's nothing. They're not trying to be negative. But we perceive it to be negative because it's not a smile, that's for sure.

DAVID: Right. I remember Pete Peterson telling me about being at this Antarctic base where there were several types of ETs including a Mantis type. And that when it would laugh, that it would put his head down because all the mandibles would--there was three on each side and they would open up. And it was so disturbing for us that it learned to just put its head down when it laughed.

SMITH: Yeah. What's more disturbing is how we laugh to them.

DAVID: Right.

SMITH: One of the most hideous sounds I've ever heard, you ever think about it and put yourself on their side and start laughing. What an interesting sound that may be for them, because it's not a normal vocal vibration for sure.

DAVID: Sure. Now Pete also had talked about--it's really interesting how similar this all sounds, because Pete had described the Mantis being and how it spoke. And he said that there was some kind of orifice on its back that it had to essentially belch out of, and that it had figured out how to turn this into speech somehow. That it was this very kind of strange sounding thing. And Pete had dialogue with the being about this at one point and it said, well, imagine how gross you are to me.

SMITH: Right, exactly. What is that thing, that big hole on your face, sir? It's neat to do the perspective, for humans to turn it around. I want everyone to do that. Think about how you would react to one of these. Could you accept them because of the way they look?

DAVID: Well, how do you feel when you're around one of these insectoids, let's say?

SMITH: Oh, they're very comical. I mean, they're very--they have great communication. The insectoids are very loving, caring energies. They actually tease you sometimes with their intelligence. They get a little pun out of saying things and doing things around you.

DAVID: Well, so much of what we have in terms of human empathy comes from these extremely subtle muscular movements in our eyes and how that makes us look. But with a set of compound eyes you just have a bunch of dots that wouldn't have any soul at all. So how would you feel humor from a being like this when you can't get any eye information?

SMITH: You don't need to because a lot of this energy is telepathic and telekinetic. So you actually feel happy. You might, like you get chills walking into a dark room at night because you might feel a ghost. But it's the opposite. It actually enlightens you. It actually puts you in a good mood. And your body picks up on this. And a lot of communication in a lot of species out there with extraterrestrials is all based on just that without vocalness. It's all just looking at each other and gathering information. Just like dogs look at their owners at one side of the face and it tells them everything they need to know of how you feel.

DAVID: So you feel this sense of humor and this personality coming from the being without any facial cues at all that you would normally recognize?

SMITH: Right, because a lot of these insectoids have just a very hard skin, very reflective skin. That there is no, all these muscles moving up and down. They don't have a muscular structure except to open and close their mouth or eyeballs. They don't have a flaring of the nostrils, which we pick up on subliminally just as humans. So it's a very different feeling. It's different aspects of communication.

DAVID: So let's go back again to the Ant people. And I had asked you to walk us through a specific example of where you were doing an autopsy with an Ant person. Like what were they there for and what were you autopsying?

SMITH: There was a big project where they found multiple Ant people that were somehow killed by chemicals of some sort. And there was a lot of them that were brought into the facility I remember, by the truckloads actually.

DAVID: Did you have any idea where these casualties happened?

SMITH: No, I don't know. I do believe it was in North America somewhere.

DAVID: In an underground facility then?

SMITH: Yeah, I think that somehow they were discovered. And I think they were probably taken out in some fashion in New Mexico, Colorado area. I don't know the specifics. But they did bring in multiple beings. And these beings all died of asphyxiation. And their lungs were completely burned out. And some of their mucous membranes and eyeballs were completely burned out.

DAVID: Wow.

SMITH: So these Ant scientists that were there were actually assisting, trying to find out and see what happened to these individuals.

DAVID: Now were the Ant people in the room that were alive the same types as the ones that were dead?

SMITH: Yes.

DAVID: Really?

SMITH: Yes, the exact same types. And it was the first time I've ever felt sorrow next to an extraterrestrial.

DAVID: Really? What was that like?

SMITH: It was really upsetting. That was--sorry.

DAVID: It's OK. We've heard from others that you feel 100% empathy with them. Like, if they lose a leg you feel--

SMITH: You feel it.

DAVID: --like your leg is lost. If they lose a loved one, it's like your own mother or father died.

SMITH: Especially if you're working with them a lot. There's some sort of frequency exchange. Could last for weeks, could last for years, where you have this connection with them. And it's--and to relive that is overwhelming, whether it's good or bad. And you also have dreams, too, beautiful dreams.

DAVID: Do you know if the being that was in the autopsy room with you had actually known these people? Was there a community? Were these people their friends? Or were they just--

SMITH: It was of the same race and they did not know them that I'm aware of and did not show anything that they knew them. But just had an affinity for their own kind being so massacred.

DAVID: Did you ever get any information about where they come from, or how did they get to Earth? Did you get any briefings like that?

SMITH: No. I know their civilization is pretty rampant all over our solar system and universe. So--

DAVID: Really?

SMITH: I don't know where they're exactly from. I didn't read up on that as much as the other species. But they seem to have been around a lot longer than the human race.

DAVID: Could you describe the color of their face? Like when you--

SMITH: Oh, yeah, it's like a blackish red, kind of like a brick color. And that brick color can go in many shades. And I've also seen a little bit more yellow than red. But they all have a similar fading of the blackish red, in and out through their body and their legs and arms.

DAVID: Are there any antenna on their heads?

SMITH: Yes. They have antennas.

DAVID: What does that look like?

SMITH: They're shorter than you would see here on Earth with the little antennas that the ants are--they could be thick, they could be three inches, they could be four inches, five inches. Not long like you see on our Earth, like these long antennas which are like half of the body.

DAVID: You probably don't know this, but that's exactly what Corey Goode said.

SMITH: I do not. I never heard that. And you guys know I don't watch Corey or Pete Peterson. So that's really interesting he said that.

DAVID: Yeah.

SMITH: Because that, you can't make that up.

DAVID: You can't make that up. It's very cool.

SMITH: Cool.

DAVID: I didn't want to give you a leading question.

SMITH: No, please, yeah.

DAVID: So when we have a Mantis type being in the autopsy room with you, could you bring up for us one specific example where, let's describe what the being that you were autopsying was. What was the mantis being there for? Why was that project being done?

SMITH: Well one of the autopsies we did, we had a mantis being with about five other scientists in there. And we were working on a regular, actually a human. But an extraterrestrial human that was not from Earth, that was born in somewhere else. And they were a lot larger than us, probably another foot or two taller. I think seven and a half feet to say the least, like the size of an NBA player. And it was a very white, albino looking skinned blue-eyed person that I don't know why we were operating on him. But they did bring the Mantis in because the Mantis was able to somehow reactivate the brain through electric stimulation from them, even through a suit. And can memory recall what happened to the person before they died.

DAVID: Really?

SMITH: Yes.

DAVID: Wow.

SMITH: And that's why sometimes they are brought in. And they're very docile, very gentle beings. And when it's not that serious of a situation they can be really funny.

DAVID: How much like a mantis' face would this face of this being look like?

SMITH: Oh, it is dead on. On the Mantis it is dead on, that triangular shape with the bulging eyes. And it's all the same color. Their face and eyes are exactly the same color. So it's a little weird. They're usually a pale green. And they can change color at will.

DAVID: Really?

SMITH: Yes. And it's neat to see them in deep thought when they're doing these processes because it's a wave of rainbow light going back and forth through their face.

DAVID: Really?

SMITH: You kind of can get mesmerized actually by it.

DAVID: Wow.

SMITH: I always love when they do that. I get so captivated. And I'm looking at them

through the actual helmets that we use, these large glass spacesuit helmets. And they're just so, just amazing to look at, especially when they move, too. Like, I talked about these other ET that moves so fluid. But they're just more angled, their visor is more angled. They don't have the articulation that we do in our joints. It's usually one way or the other, but very precise, very precise.

DAVID: When we're looking at hands on either an Ant person or a Mantis person, are they human looking hands? Or what might be different?

SMITH: They have five--they all have five fingers, the mantis. The ants may have anywhere from four to five fingers.

DAVID: Really?

SMITH: But they are fingers and they're jointed. And they can move them. They're just more like pointy, and you don't see any muscles in them or anything like that. It's just because of this exoskeleton like the insects we have here on Earth. Feet are different, though. Not the feet. The feet do not have five toes.

DAVID: What do you see?

SMITH: Usually a two toed type of appendage on the bottom of their legs. Yep, and it's very wide stance. And those toes are very long. Some can be up to 10 to 12 inches long, but only two. Sometimes you'll see a little back toe sticking out.

DAVID: The toe kind of shoots forward like this?

SMITH: Exactly. And then one little back toe like a--I don't even know what to compare it to. But you understand there's a back one. So it's a Y. Their feet are like this Y shaped.

DAVID: So we've been through, now, Mantis people. We've been through the Ant people. We've been through simian people. You also mentioned reptilians.

SMITH: Yes.

DAVID: Now, the reptilians that we've heard about from Corey are extremely antagonistic to us, extremely violent, extremely evil. It doesn't sound like this is the same thing in your case. So could you tell us about, what were the reptilians that you saw? And what were they here for?

SMITH: Well, the reptilians that were working on the projects that I was involved with were very intelligent. They didn't have much of a personality. They're very direct, very robust. Not to be funny, but they kind of look like a Sleestak on the "Land

of the Lost," the old version. And they stand very erect and they do have the same type of toes and hands that you would see on the insectoids. They're more like a three toed, three prong hand. But very dexterous, very ambidextrous and dexterous. They could grab things just like we do. And they're very strong for their size. You may see one anywhere from six to ten feet tall. They don't have any snout. They have a regular like human face, scaly. But very large eyes, twice the size of our eyes, with pupils like us not the slits you see in the movies. It's under my understanding that these might be hybrid human reptilians that were designed somewhere. I did read a lot on their space center and the bootes region of the Arcturus star system area, where they have a type of planet there that was man made like you would see in the movies like "Death Star," where they raise families and educate these beings at a very young age. The families are very large. The male and female might have a minimum of 30 children.

DAVID: Wow.

SMITH: Yes. And they have a gestation that's a lot faster than ours. It's not nine months. It's like three months. And their genitalia is also retractable into their bodies. So it's really hard to tell if they're male or female.

DAVID: That's another thing that Corey has independently reported, yes, same thing.

SMITH: Interesting.

DAVID: So you said that these beings looked sort of like the Sleestak on "Land of the Lost." And I do remember as a kid being very, very freaked out when I saw those.

SMITH: I was petrified of those beings as a little child.

DAVID: Yeah.

SMITH: And they did it well. I mean, they do look like so intimidating. They don't have muscles in their face to smile so they always have the same expression. And even though they're so, they might be happy inside. You would not know by their face because it's always the same expression. So you can only know this by communication and by feeling their energy fields. And another thing, they didn't run around like you see the Sleestaks on the TV show like that are, I mean, naked with no clothing. They actually had a special suit kind of like a Spandex fabric that covered their whole body. And I finally found out why they wore these funny suits. They looked really funny in them, because I was hoping to see this naked Sleestak running around right? But no, it's not like that at all. It's very misleading. It actually had this Spandex suit covering most of its body except for the elbows down and knees down. And it was actually to control this odor that they had that's very pungent, that's a pheromone that they always release. And anytime they get really excited or happy it actually just kind of pours out of their body. And this absorbs it and neutralize it using

some sort of ionic technology that I'm not familiar with.

DAVID: Well, you wouldn't know this because you haven't watched the show to not get contaminated. But we've had Niara Isley, we've had Pete Peterson, and we've had Corey Goode all report on the awful smell that these beings have.

SMITH: Yes.

DAVID: So this was a way for them to be more social, I guess?

SMITH: Yeah. They actually do communicate a little bit. Don't forget these beings can breathe through their skin. And these pheromones are actually a way of communicating with others. And I heard that their smell is so good--and they do smell with their tongue, and they have a very interesting tongue. It's not split or anything but it's very long. But they don't ever show that, by the way. That's just something they do, I think, when they eat. And their eating is also very interesting because they only eat like once a month. And these smells and these pheromones can be smelled, they can smell this for a few hundred miles. It's like the raptors and the birds and the sharks of the ocean that can pick up on these small molecules in the air. Not to say one of these reptilians would completely contaminate a 10 mile underground base with their stench, but just to say where they're from this is another form of communication of how their emotion is at that point.

DAVID: It seems to me from what you're saying now that our military industrial complex is already deeply involved with benevolent extraterrestrial species. Do you think these benevolent ETs want to be known to the rest of us at some point? Do you think there is going to be some kind of opening up of the veils of secrecy?

SMITH: 1,000% they want this. And I think by them doing these humanitarian projects to show their willingness to help and work with us, to learn their customs and to learn about their physiology, is the first step for human extraterrestrial interaction and trust.

DAVID: Awesome. Well Emery, I want to thank you for being here.

SMITH: Thank you for having me.

DAVID: You're very brave. And I want to thank you for watching. This is "Cosmic Disclosure" with our special guest, Emery Smith.

Reptilians and Aquifarians Season 11, Episode 8

Cosmic Disclosure; Reptilians and Aquifarians Season 11, Episode 8

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock, and I'm here with our guest Emery Smith with deeper insights into his extraterrestrial coworkers. Emery, welcome back.
EMERY SMITH: Thanks, Dave.
DAVID: This is one of the most fascinating topics of your testimony as far as I'm concerned because it's one thing to have a specimen that's dead. And as you said before, you didn't know whether these were really extraterrestrials or not, right?
SMITH: No, I had no clue.
DAVID: What could be an example of something where you knew that it was an extraterrestrial? Were there any cases where it was certain that it was not a genetically modified being?
SMITH: Yes. I mean, after a few years in the projects and your clearance gets up and you're getting briefed on different scenarios and different types of extraterrestrials, where they're saying they're extraterrestrials or beings from other than Earth origin, and also getting access to the most amazing libraries of encyclopedias that they have there--it's all on computer mainframes--you get to really understand that we're just a small, small part of such a wide and vast array of other beings that are spread out through the universe and multiverse.
DAVID: So if we could take off in a ship and start going to other star systems, how common would it be to find planets with inhabited intelligent life on them? Is it seldom the case? Is it sort of half and half? Is it mostly the case, or is it almost always the case that a given solar system will have some intelligent beings living in it?
SMITH: The best way I could put that is if I were to ask you if you jumped into the ocean, how many different species would you find amongst just jumping into one ocean? So it's that vast and there's that many beings. There's unimaginable amount of beings of different races.
DAVID: So you could then say that pretty much any star system we would go to, unless there was really horrible conditions or something, is going to have beings that have set up shop there and have civilizations?
SMITH: Exactly. This is what people don't understand, because beings don't need a planet to survive on. They have already mastered to make their own planets and their own space stations to live on. And there are some beings that never touch a planet but they travel around, of course, because their own craft or ships that are hundreds of miles in diameter can actually reproduce living conditions such as a planet, such as an ocean, such as an island, such as growing food.
DAVID: When we were talking about your extraterrestrial coworkers before you had

mentioned this probably more benevolent Reptilian race. You'd mentioned they were in a constellation called Bootes. Could we discuss a little more about that? Like, if we went to their star system, what would we see?
SMITH: Well you would see a lot of traffic, number one, in this area because there's just a lot of races that live in this sector of space. But the one I was talking about has a type of Death Star look to it. It's man-made, and they have craft on these space stations that look like meteorites. And they can be up to 30 miles long, some of these. And they can also be as small as a compact 24-foot U-Haul truck. They have a lot of families there. They raise their children on these things. They get educated there, they graduate just in a few years of life and have a higher IQ than we do, just in two or three years, these children. They also have a faster healing rate than we do. And we're trying to study that healing rate from the Reptilians. Maybe you've seen some of the pictures on my website of me taking the blood from alligators. This was a direct correlation of what we were doing to test, why can an alligator in the Everglades sustain a huge wound of another alligator ripping its leg off? And then in just a matter of weeks, not only did it coagulate just fine but it also had no infection and sometimes grows back. So some of the projects I worked on was actually doing this is trying to replicate the healing factors of the genetic DNA of these Reptilians.
DAVID: I find it very interesting when we look at Indian history in the Mahabharata and the Vedas that we have what appears to be an evil Reptilian race called Rakshasas, but that there also was a benevolent Reptilian race called Nagas that they actually ended up making temples out of. And you actually see lots and lots of stone inscriptions of what looks like humans, but then they have like a Reptilian tail like a snake. So do you think that these benevolent Reptilian ETs that you were talking about could have been there at the time of the Indian civilization where those texts were written?
SMITH: Yeah, I 100% believe that. I know all the texts you're talking about. I know of the statues that you're talking about. I know the amulets they made of them and some of the carvings down there. So I agree that these reptilians I'm associated with that I know are this a little bit more docile, hybrid-type, human-type figures and they were looked up as gods.
DAVID: Now it's also interesting because Pete Peterson did say that there was a benevolent Reptilian race as well. And he had told me that they were very keenly interested in our religious development, our spiritual development, that they were very wise, very advanced, and they really seemed to want us to become ethical and to learn how to all get along with each other.
SMITH: Yeah I can concur with that. They do have a religious background that I don't know everything about. But they're very strong about it and they do carry amulets and jewelry that show their belief in this system. They also have sometimes special clothing for certain holiday-type things that they may wear, such as a scarf or a ribbon on their arm. And these things celebrate this religion that you speak of, which is the unity of all and one that they believe in. And they believe even though they're of different genetic DNA, they also believe that everyone has their DNA. And they

believe in the system that they were kind of the first ones in the solar system and universe that actually seeded it. And over billions of years, other formations of their genetic lineage has mixed around and is actually where we come from. And that's why you see sometimes in the medical society of people saying, well, we have the reptile part of the brain and this because were associated with an iguana or something. So it's very funny that this is all coming out and the questions that you ask because I do believe there's a correlation with this race and we might have a little bit of that DNA in us to some extent.

DAVID: I'm just curious if you ever heard about this benevolent Reptilian race, talking about the Draco and the very antagonistic other types of Reptilians that apparently just about everybody was opposing. Because this Draco seemed to be this group that's trying to invade and conquer just about every other civilization they can find.

SMITH: I've never heard them speak about that. I've never seen any data to support that from their lineage. They do have their own belief of where they came from as far as the very first Reptilians, which I do believe probably could have come from the more Draco style, evil type Reptilians that people talk about. But I can't really say, honestly. I'm just speculating on that.

DAVID: Well this is a very interesting point because Pete Peterson did say that there was a Reptilian diaspora. A diaspora is when essentially one group that is a spiritually inclined group breaks off from another group because they believe that group has become evil. Pete said that these benevolent Reptilians he spoke about had had a diaspora from a negative Reptilian group in the past. Very interesting.

SMITH: Very interesting.

DAVID: And perhaps the fact that they might have been hybridized with humans means that maybe they would have more compassion for us.

SMITH: Right. Yeah, I believe that lineage carries over through DNA.

DAVID: Yeah, very interesting. Let's go back now to some of the other extraterrestrials that you've had as coworkers since that's our main topic on this episode. Could you give me an example of one race that we haven't spoken about yet that you can share with us now?

SMITH: Yeah, I can go over a couple of races. I think maybe I should talk about the more liquid-state planets that are associated with ETs. You know, everyone thinks ETs are all just of the 3D in this Earth-air atmosphere, and it's not the case. You have beings that have to live in water or come from a water planet. You have these types of beings that come from the Pleiades system and we call them Aquifarians. Some of the first of these extraterrestrials that live in water. They don't need to, but their planet is 98% water. And they actually work in water. That's where they feel comfortable.

DAVID: And you said they came from Sirius?

SMITH: No, Pleiades. The Pleiades System. Yes. The Aquifarian-type extraterrestrials, they call them through my experience.

DAVID: Well this is very interesting because there is a correlation with a book by

Robert Temple called "The Sirius Mystery" in which he studied this particular African tribe that comes from Mali, and they have this Aquifarian race--I'll use your term--that approached them called the Nommo. And they gained very precise information about the fact that Sirius had a little companion star called Sirius B. They had information about the planets that were around it, all this very specific stuff. And their legends clearly describe these as aquatic humanoid beings. So this is a really interesting new line of inquiry.
SMITH: I mean, I have to comment. A lot of our operating rooms and centers in the bases are definitely completely filled with salt water or fresh water just for this type of thing.
DAVID: So you would actually do an autopsy in a self-contained suit inside water?
SMITH: Yes. Underwater and heavily weighted down with magnets that keep us on the ground. And we have all the sustainable air through the same hoses that I use above ground.
DAVID: Sounds like it would be exhausting if you're fighting against--
SMITH: It's very taxing on the body for some reason. I don't know if it's just because being under water. It's just even mentally taxing. The energy or something of the water. It's kind of like scuba diving where you can get tired pretty quick. And you do seem to use a lot more oxygen under water, for some reason, when we are doing these giant autopsies and also looking at the craft. Some craft have to be in a special salt soluble water for them to stay intact. Once they are turned off, they cannot hold their shape.
DAVID: Would that imply that they could only portal from one ocean to another and they wouldn't fly through space?
SMITH: They can fly through space because they have their own gravitational field around them that encompasses the water.
DAVID: Oh, really? That's bizarre. So let's talk about these Pleiadian Aquifarians that you saw. I'd like to start with a visual description of what they look like.
SMITH: Well there's many types of water-type extraterrestrials. There are some that look like manatees, there are some that look like dolphins, and there's even some that do have a shape from the waist down that's kind of scaly and has fins on the outer edges of these beings. But from the chest up, they actually look pretty human.
DAVID: Now just to be clear, these are extraterrestrial live coworkers that you're seeing on these bases, correct?
SMITH: Yes.
DAVID: OK.
SMITH: And I think this is maybe where the mermaids come from. I think this mythological background of the history of these sailors seeing these beings could possibly have had a base here on the planet. And there is a lot of cities that people are discovering, but the Cabal does not let people know this, that are underground and it wasn't because they were flooded. It's because that's where they really were, these cities. Under the ocean, I'm sorry. Under the ocean. And that also proves the fact that

these extraterrestrials lived here and they flourished here at some point in time. And I know you know a lot about the history of the mermaids and some of the extraterrestrials over in Asia. I think they're called, what's the name?
DAVID: Kappa, in Japan. Yeah let's talk about that for a second. It's a very interesting thing which was research I learned in part from having had a Japanese girlfriend in college. And I was already very interested in extraterrestrials by the time I was a senior and we had this relationship. So I found out firsthand that they had considered it an absolute fact that you could not have your kids walk near bodies of water. And they still to this day have warning signs near the water warning about the Kappa, which the legends say is a Reptilian aquatic being. And it comes out of the water and grabs kids and drags them into the water. So these beings could speak their native Japanese language. They would make jokes. They were often very inappropriate and rude, they would make rude noises, rude gestures. And they were very sarcastic and arrogant. So do you think these Kappa could be actual extraterrestrials that got here somehow?
SMITH: I do believe there's some sort of correlation with a lot of the stories over there. These descendents from the Aquifarians, I think, are multiple as far as genetics and DNA. Just like we have a lot of different types of humans here, and over millions and millions of years we have spread across the universe, the same thing has happened with the Aquifarian people. And they do come in these different forms like I talked about.
DAVID: So in your projects then, the term Aquifarian would be an umbrella term that could refer to many different types?
SMITH: Exactly. Yes. It's a multi-race under the phenotype of a water being.
DAVID: Did you see any that had a cup in the top of their head like the Kappa?
SMITH: No, I actually didn't. I've not seen that at all. But they somehow are able to breathe air and also breathe the oxygen in the water. And some do have gills like you would see in the movies on their backs and necks. And they're multiphasic where they can walk out of water and breathe the air through their mouth. And we've operated on some of these and they have air bladders and they have different types of lungs. Very interesting to see four sets of lungs in a being that can filter just like you would see in the sharks and the gills of many modern day fish that we have here on the planet.
DAVID: Now you had said that some of these beings actually have a head that's like a dolphin?
SMITH: Yes. Just to really be more specific, if you can see a dolphin with two arms and two legs and standing upright. And very, very cylindrical body which stands out, not that big fin on the back, though. And they do have these little webbed-type feet. But they have arms, and the arms have two different phalanges. You know, two fingers on there. And the face does not have a snout like a bottle-nosed dolphin or anything like that. But they have a very large mouth. And it does come out just a little bit of a snout but not like you would see on our modern day dolphins and porpoises. But the mouth goes all the way to the sides of the face.

DAVID: That would be a little disturbing to see, perhaps.
SMITH: Yeah, it's a little, but they don't ever open that mouth. You never see that mouth. And they have lips like a grouper fish. And they're kind of funny looking, actually. No offense, guys. But they do look kind of comical looking like you'd see on a cartoon character. And they only communicate through telepathic waves and through frequency. And you can hear those sounds, the same sound you hear with the whales that you probably hear in your meditation CDs.
DAVID: Now with the dolphin, the eyes are kind of way on the sides of the heads. So how do the eyes place on these faces?
SMITH: So imagine a very round, bulbous head like a light bulb. And those eyes are on the side of the head, but they do have great vision. It's still more forward than you see in our society of dolphins or whales where they are completely like a hammerhead, way out here. So they are forward-looking eyes.
DAVID: Do they have any ears?
SMITH: Just the slits, the holes. But no ear lobes or anything like that. They have very small fins on their back, not like the big fins you would see on a dolphin or a shark today. Maybe only three to four inches of these little fins that go down their back. Maybe five or six of them in the middle of the back only.
DAVID: Now you mentioned that their whole body is like a big cylinder. Do they have just stubby little legs at the bottom?
SMITH: They do, they have very stubby legs with these big fat feet. And they do have toes on their feet and they're webbed. And they have this webbing on the sides of their body like the other Aquifarians, which I think is an Aquifarian trait to have this very thin, all the way down their arms and their body. And sometimes you actually see it on the heads of different ones like the manatee ones. And there is something there like that cuttlefish fin that goes all the way down to their feet.
DAVID: Now as far as the arms go, obviously a typical dolphin just has flippers, but yet when we actually look at the skeleton inside the flipper, it actually looks like a hand.
SMITH: It is. And they do have a humerus. They have the same bones we do. And instead of you guys seeing like a skeleton of a whale where you guys see just that bare hand. You could see this. Even the whales, if you look at their stuff, even their back, they have little leg bones inside their body that somehow over millions of years have receded into them. But these are full skeletal arms and legs just like we have.
DAVID: So if the legs are stubby, what are the arms like? Do they have more length on their arms?
SMITH: Yes, they have more length than the legs. Absolutely. They're not the fastest runners in the planet.
DAVID: But again, it kind of sounds to me as if there's this humanizing intelligence that takes different types of life and will make it so that it has opposable thumbs and hands and--
SMITH: I believe there is a conscious energy in the universe that, over time, affects other planets around the whole universe, and maybe multiverse, where it's the same

five star program. I think it's some sort of program.
DAVID: So do you have any information about where these dolphin beings came from? Did you ever work with them directly, one on one?
SMITH: I've only indirectly worked with them. That means I've only seen them. And I've never been able to communicate with them because it's a very special language and you have to have a special device that interprets the frequencies of their chirps, their chirping. And it's kind of like Morse code but very, very fast. You could have a few dozen chirps in a second. But we don't have the brain or the hearing capabilities to catch it. It's so fast. But it's you know a whole conversation that we would take maybe, in one of these episodes, 30 minutes could be done in five minutes for them.
DAVID: So do they feel like it's really slow to talk to us? Is it boring for them?
SMITH: Yes, and they have all a three-times size of our brain. And they're very conscious. And I feel bad for the dolphins and whales here because we should treat them like we treat these ETs. Just because we can't communicate with them doesn't mean they're not conscious or they're stupid. Maybe we are ignorant.
DAVID: So you have no information about where they originated?
SMITH: From Pleiades and Sirius section. The Aquifarians started in the Pleiades and then migrated, I know, to Sirius section. I don't know where in there. But I'm only telling you what I've read from the history of being in that library. And I was fascinated, of course, with dolphins and whales. I have a really good connection with them. I've done a lot of underwater photography and have a great bond with these fish and the mammals.
DAVID: Could we now get into the manatee being, that you mentioned, a little more? Tell us more exactly what it looks like visually. Let's start with the face. We know what a manatee's face looks like. Kind of like a walrus but without the tusks.
SMITH: Yes, it does kind of look like that. I used to make jokes by my dear departed Beowulf, my dog, that recently passed. He has this face, he's a French mastiff. You know, he's a Dogue de Bordeaux, but it's very human. It's more stout instead of having the big, like a manatee has this big blubber snout with all the whiskers. It's more contracted, and the eyes are pitch black and they're very close together on these beings. And they're very obese looking. And they have little hands that they really don't use, kind of like a T-Rex. And it's really funny. And they're very comical.
DAVID: When you say they look obese, would they have the rolls like we would see with a very overweight person?
SMITH: Yes, they have rolls. And they're very strong beings. And they also have these short stubby legs. Maybe 24 inches up to where the knees go into the body. But they're very tall, very large. They actually dwarfed over me at least by two feet. And they had this personality of a very old scientist. And they know everything. Their main thing is history, about how they came to be the enlightened Aquifarians. They compete with the dolphins and it's a very funny thing. Kind of like my dog does, he knows everything. And I get this real humble feeling. But they can talk. They have vocal chords, they don't chirp. They don't have that other vocal as the dolphins and other Aquifarians. They actually can speak. And they speak in very deep tones and

deep voices unlike any human you have ever heard. I wish I could replicate it, but I can't.
DAVID: So just some basics here, like what would their color be? What would the color of their skin be?
SMITH: It's just like you see the manatees here on the planet. They have a dullish gray. But it's not weather-beaten like you see our manatees. And I've worked on many manatees. I've done stem cells on manatees down in Florida that got run over by boats with the propellers. And they have a smoother textured skin that has a sheen to it. And it's a bluish gray. And they do have whiskers on the sides of their face, kind of like a very small mustache.
DAVID: You said that there's little hands poking out from the top of their bodies. Do they have fingers and thumbs like us?
SMITH: Yes, they have four fingers and a very small thumb that you can barely see. Just a nub. And they can use them. I've never seen them hold anything, though. I've never seen them grabbing or holding. But they're very agile. They can move around. They're very fat and large. And they communicate very well. And you could hear a deep voice around the corner and you know it's one of these Aquifarians from this system.
DAVID: And do you know where they're from?
SMITH: They're also from the Pleiades system.
DAVID: Do they wear any clothing?
SMITH: Yes. They have suits that they wear that are formed over them through a special device. Don't forget, they can be in the water or out of the water. They can hold their breath a very long time but they don't breathe the water like the other ones do, so everyone knows. But they can definitely work under water for over an hour. I remember a few of them watching in one of the aquarium's operating rooms. They were treating one of their own for something. I don't remember exactly what the story was behind that. But I just remember admiring them working on these beings under water with their little fingers. It was really cute. And I just wasn't able to ever interact face to face like you and I. I was just indirectly part of a program where I was watching them and people were teaching me about them.
DAVID: OK, last question then we're out of time here. You've mentioned getting a telepathic, spiritual ecstasy hit from some of these extraterrestrials. Now these you said speak verbally, not telepathically. Do you still feel some sort of spiritual bliss by being around the manatee beings?
SMITH: Yeah, there's something about them. They can resonate an actual sound from them that humans cannot hear, but they can feel it. And it's a really beautiful sensation. It reminds me of when I hear a good song. Starting to like, you know, starting to feel it. And that's what I feel when they're around. It's this low tone thump inside you. You can feel this from a very far distance from them. They were at least 30, maybe 40 feet from me. And I was outside of the tank. And they're sitting there doing this energy. It's just energy, they're not dancing. But it makes you feel like

music. It's like harmonic of some sort. It's really beautiful.
DAVID: Well that's all the time we have in this episode. It's very, very fascinating and I do hope we get to meet these beings soon. Do you think that will happen?
SMITH: Oh, I know it's going to happen.
DAVID: Wow. That would be amazing. Well I want to thank you for watching. This is "Cosmic Disclosure" with our special guest Emery Smith.

Bigfoot and Tall Whites Season 11, Episode 9

Cosmic Disclosure; Bigfoot and Tall Whites Season 11, Episode 9

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock, and we're here with our special guest, Emery Smith, continuing our fascinating discussion about the co-workers that he actually interacted with as live beings while in the underground facilities. Emery, welcome back.

EMERY SMITH: Thanks, Dave. Excited to be here.

DAVID: What was the very first extraterrestrial that you saw on these bases--the first time you actually saw a living being that was not human like us?

SMITH: That's the Tall Whites.

DAVID: Oh, OK.

SMITH: Yeah, absolutely.

DAVID: So could you tell us a little bit more about that first meeting? Because obviously I would think the very first time you actually see a living being that's clearly not one of us, it has to be just an absolute landmark moment in your entire life.

SMITH: Well actually, indirectly, by seeing these from afar, and seeing these through different windows and different programs, and then reading about them, I had a really good understanding of what was going on way before I was even getting able to see these, by researching programs that I was allowed to. So they're breaking you in first just by watching videos, and reading books, and reading things on their database system that have to do with the past of working with these beings and these creatures.

DAVID: So let's open up this Tall White discussion, because there has been some confusion in terms of, for example, certain discrepancies between the whistleblower named Charles Hall, and what he called Tall Whites, whose eyes seemed to be more like Greys, but had a bluish tinge. We have Pete Peterson who's described his experience with Tall Whites, and he said that it doesn't really mean any one type. It just is a classification based on their appearance. And Corey has his experiences with the Anshar, which appear to be very much more human-like, but as they age, they will get taller eventually. So what would you call tall whites? Just give us a description of what they look like, and any other specific physical identifying details to start with.

SMITH: Sure. They're over seven feet tall. They have a small face, a little bit smaller than ours. They're very slender in the arms. Very ectomorphic as we would say. They

have a very fluid movement that's actually like a dance. So it's kind of like this--when they move, they're articulating their joints, and their limbs are flexible, not like ours, which are really rigid. They also have a very deep understanding of all of our belief systems, and they're very compassionate, and they're very smart. And I've seen them from afar probably six to seven months before I actually--was actually next to a few of them during a project.

DAVID: So if I gather correctly, then, the face would be predominantly like ours, but just smaller.

SMITH: It's slender. I hate to bring up movies, but in the Star Wars movies, there was a group of tall white beings that we're making clones of one of the soldiers there, and they were in charge of this planet, and they had this really slender, beautiful, oval face with these really beautiful eyes that took most of the face up. So the eyes were at least two times to three times larger than our own eyes, and their nose was almost non-existent--very small, very petite, kind of like an Asian nose, with just very small nostrils, and beautiful lips, and a nice small mouth.

DAVID: So the eyes are a very prominent feature, then--

SMITH: Yes.

DAVID: --but they would be almost like one of these Anime characters in the sense that it still looks human, but they're just a lot larger.

SMITH: Exactly. The eyes are oval, and they're offset about 20 degrees. So they are like this. Ours are this way, but there's is offset just a hair, so it's coming this way, through the ovals.

DAVID: So more of a Russian or Scandinavian look, then?

SMITH: Correct.

DAVID: OK.

SMITH: And when I refer to the Tall Whites, I am not referring to the blond blue-eyed tall people from Scandinavia that you hear a lot in pop culture of those. These are--

DAVID: Like the so-called Nordics.

SMITH: Correct, the Nordics. I mean, their skin is just ash white. It is so white that they actually--light comes off of them and reflects off of them. It's a really beautiful type of skin, kind of like a sheen to it. But very white, and very long fingers, and

regular feet like we have.

DAVID: Are they bald?

SMITH: Yes.

DAVID: OK.

SMITH: There there's no hair. I've never seen hair on any of them.

DAVID: Really?

SMITH: They do wear clothes and uniforms like we do, usually skin-tight types of clothing. They have a very intricate internal organ system that is capable of living on almost any planet or any atmosphere. So they can breathe a lot of different types of gaseous chemicals, and different gases that would normally kill one of us. And they have a very small chest, in a V shape.

DAVID: So it definitely doesn't look like a Grey.

SMITH: No.

DAVID: It would be like a bald person like us, with white skin, but a more skinny-looking face who's just really tall.

SMITH: Right.

DAVID: One of the things that Pete described about these beings was that they would have a wand. Did you ever notice them carrying a wand--

SMITH: No, I never--

DAVID: --or any type of tools?

SMITH: I never seen them have a wand, but they did wear these special bracelets, and these special collar-type things. And I don't know if it has something to do with their internal organ system. But I wasn't really debriefed that much. That's all they told me.

DAVID: OK. Did you have any idea as to what those bracelets or collars might function for?

SMITH: Well they had lights on them, and these lights were like a blue ribbon around the center of the collar. So the collar was about an inch thick--I mean an inch wide--very thin, and in the middle of that collar, maybe a quarter of an inch, was a stripe that went around it. And this light rotated around this blue centerpiece, and it was always

on, and it was always coincided with the bracelets they had on.

DAVID: They rotated in phase?

SMITH: The light--yeah, they both rotated in the exact same phase. Yeah.

DAVID: So did you ever have an intuitive sense, or did you try to guess as to what that might be for?

SMITH: I think it has something to do with maybe, when they travel to different places, this helps with getting certain nutrients, and chemicals, and minerals, and vitamins into their body somehow. I think it's somehow keeping their voltage up, and keeping them energized.

DAVID: The version of Tall Whites that Pete was talking about, which may not be the same, he said that they really have trouble getting too close to humans like us, that it's almost a psychic mess for them. Did you observe them in some degree wanting to keep distance from regular earth humans?

SMITH: Not these Tall Whites, but yes, there have been other Hybrid Whites that are over-sensitized by our fields of energy because they're picking up on every cellular energy we have. It's not like we're all in one sync to this other white race of ETs, and I think it has to do with we carry a lot of bacteria--good bacteria, and bad bacteria, and viruses on us, and they all give off this special pulse of energy, and it's overwhelming for them, and they can actually get sick by being around a human too much. So I think that's what he's referring to.

DAVID: Describe for me the first time that you encountered a Tall White, because this is where we're saying now, you saw him through the window, you might had some briefings or something, the first time that you actually are face to face with a non-terrestrial entity.

SMITH: They were brought in on a number of occasions, working on humans that have deceased for unknown--I don't know why--unknown reasons.

DAVID: Earth humans?

SMITH: Earth humans. But they obviously were very concerned about this, and they would be brought in, and worked with the team. And I had two of them at one time in the same room that I was working on taking some samples from somebody.

DAVID: Was it easy to tell the difference between men and women?

SMITH: Yeah. There was a feminine--more slender facial features, and the eyes were

a little bit not as large, and the eyebrows also--not eyebrows, but you can see there was a tinge of an eyebrow, but not hair. It was just like the pigment was different above the eyes, a little bit off white, I'll say. And you could tell by those two reasons, just facial features. The bodies looked pretty much identical. And I'd never seen them walk around. They always had some sort of clothing on or something.

DAVID: And what did that clothing look like?

SMITH: The same. It was always some sort of skin tight apparel, like a Spandex of some sort. They always did have gloves on all the time. So this clothing material was covering pretty much their whole body except their neck and face.

DAVID: I'm curious about what was their form of communication. Did they speak with their mouths?

SMITH: They're very telepathic. They can speak perfect English, and other languages--all the languages actually. But you don't have to because they will just look at you. And they say, when you have the look, please look back, because it's this eye thing that they do. When you see their eyes and your eyes, it's like a link of some sort, where it's like the--however it works, it's downloaded, everything that they're thinking, to you, and they're very receptive to you as well, like they know everything about you once you meet them.

DAVID: So if you were to have an unloving or judgmental thought about the way they look--because I'm sure this happen sometime.

SMITH: Definitely happens.

DAVID: What would occur? Let's just walk through a situation where--

SMITH: They don't--they don't react to that, because they know that sometimes it takes a little time for people to get used to them because they're different, and the same thing, I think, would happen to us if we were thrown into their world. We would have to be really egoless, and have to accept that maybe I won't be liked because of the way I looked, or because I know everything that you're thinking right now, which is OK. It's so what, and then what?

DAVID: So I really do want to get a little more specific on the exact moment that you first made eye contact with a non-terrestrial being. Where were you? What was it like that first moment you looked into its eyes?

SMITH: We were getting dressed with our suits to go into an operating room. And their suits are a lot different than our suits, of course. Theirs are for their bodies. And I just noticed as the technicians was helping them get dressed and Ziploc their suits up,

the fluid motion they had, of going into the suit. It was very fluid, and being at the operating table, and I was helping them with some instruments. And they moved so fluidly, and so--but it's really fast. They move fast, but it's just this dance. It's really interesting. So I don't want you think it's like super slow, but it was the fluidness of, you know, their bodies are--like I said, their bones are very flexible, unlike our bones. But they do have the five fingers, and the hands. They're just longer fingers, and the palms are more square, not round like ours. And those are some of the features that I knew. I remember looking at them, not even saying anything, and it was like a greeting. It was as we're getting ready to go in, and we looked at each other, and just the word, greeting, came to me. It wasn't a voice, it was just the word, greetings. And I remember, in my mind, looking at them and saying the same thing in my mind, and they cracked a smile. You know, I could see--they have the same facial features. Their eyes move up and down. They can move their nose, and they have muscles in their face.

DAVID: Could they throw things in your mind, like colors, symbols, visual images of places?

SMITH: Absolutely.

DAVID: Give you a holographic type of--

SMITH: Yes. They even have a way, if they want to teach you something that you don't know, to basically download that into your brain--into your consciousness --in a matter of seconds. So you could learn something pretty quick that they're doing on the table from being just across the table from them.

DAVID: When you were working with them in these autopsies, you had mentioned that sometimes they were concerned about humans from here who had died in strange ways. What were some of the other circumstances that they were called in?

SMITH: Really tough cases where there might have not--that they would not know why this ET or this human died.

DAVID: "They" meaning the people on the base.

SMITH: The people on the base would give them, probably, the most difficult cases.

DAVID: To the Tall Whites.

SMITH: Yeah, to the Tall Whites. And sometimes they would not allow us in the rooms with those types of patients, but we were part of a team. You have to understand, even though you're not in the room, you still can be working on the outside of the room looking in, and helping get supplies and things.

DAVID: Can you recall a specific example of an autopsy that was not of a person from Earth that involved a Tall White, and just tell us what type of being it was, and why was it so hard to solve.

SMITH: Well this falls under the chemical thing again. We do get beings that come in--other Hybrid Whites that look shorter. They're about our height, our size, but they're very, very white, and they have crystal clear blue eyes. They always have white or blond hair, so--and they have ears, unlike--the Tall Whites don't really have ears, but the human Hybrid Whites, I call them, actually do have ears, and they look kind of like us, and their teeth are very different. Their teeth are round. So they're, like, half-mooned, not square like ours, and it is weird. You don't really see their teeth too much. And we were working on this one that was brought in that had these--looks like burned injection spots that ran up and down their chest, and there was about six little holes--1, 2, 3, 4, 5, 6, all the way down to the belly button. And it looked like it was some sort of weapon that burned it into their skin, but in the middle of these circular burns were three dots that looked like a triangle, if you could attach lines to them, a perfect triangle. And they were trying to figure out what type of weapon killed this Hybrid White, and why, and where did it happen. They can actually attach themselves to the brain of a dead being, and download its information to their head, and they can find out how did this happen, where did it happen, who's responsible, and figure out a whole story within minutes.

DAVID: Wow. So what was the conclusion? Were you aware of the conclusion of how it died?

SMITH: No, I was not aware, but they did know what happened, and they did look very sad about this. You can see the anguish on their face.

DAVID: When you saw a movie like "Men In Black," what was your feeling about that, where you have Will Smith, and there are agents working in these underground facilities with all these extraterrestrials around? What was your feeling when you saw that film?

SMITH: I'm really not a big fan of that. I don't like when Hollywood makes fun of extraterrestrials as some sort of game, or some sort of horrible threat. And I did not resonate with that movie at all. But there are many movies out there, and animation, where extraterrestrials are portrayed very well, such as the one that you and I saw recently, called--was it "Valerian?"

DAVID: Yeah, "Valerian."

SMITH: Yeah, and these ET's looked exactly like these Tall Whites. And I remember, wasn't there a part in there where the United Nations of ETs were coming together, and there was all different kinds?

DAVID: That's right. Right at the beginning.

SMITH: Yeah, that was a very accurate depiction of the many different kinds of extraterrestrials that are out there that have to bring their own environment. One was like a fish or something. It had an aquarium on his head. And of course that's kind of funny, but it actually is true. We talk about ET's wearing things that are from either their planet, to keep the energy correct, and also they might have to have a special helmet just for their head to sustain their life. So that was a really good--I was impressed with the screenwriters, and the writers, and the animators that did that.

DAVID: Now Corey Goode, when he had his first experience on the moon in modern times, so he says, encountered an avian type of humanoid that apparently nobody in the space program had seen before. And this is the blue avian--we talked about this. I know you've seen the image.

SMITH: I've seen this image.

DAVID: So did you ever see any type of Avian humanoids yourself, such as these Blue Avians, or other types that were similar?

SMITH: Yeah, similar to that, but not specifically like that. They were very human-like, and they had very small feathers and large skin pores, but they, for the most part, looked more human than they did a bird. But they did have these attributes of certain things. They didn't have a nose. They did have, like, a small beak there, but the beak actually had teeth in it. And they didn't have the kind of head you would see--it wasn't like an exact bird head, and the eyes were flat across, just like ours, but they could see perfectly straight this way, instead of--a bird probably has more on the outside. So very more--like I said, more human than anything, but had very small wing feather--little skin flaps under their arms, and lots of feathers on the back, but not so much on the face and the chest at all.

DAVID: Did any of them have tropical colors like a toucan, or how did they look?

SMITH: Yeah, they did. There were turquoise ones with a beautiful purple, white, and turquoise fading, in and out, up and down the body. So it might start with a blue head and neck, and then fade to white, and then maybe a light purple down towards the feet. But they had feet like we have feet, but it was--

DAVID: They didn't look like bird feet.

SMITH: No, not at all. But like I said, the only thing that gave it away was the facial features and the feathers, and that very scaly-type skin--a very porous skin.

DAVID: Well this is kind of ridiculous, but how would you compare it to Howard the Duck?

SMITH: No. Not like that.

DAVID: Because that's a beak that really protrudes.

SMITH: That's a big duck bill beak. But no, I never seen anything like a big beak like that, except for the pterodactyl.

DAVID: Pterodactyl being sounds kind of disturbing.

SMITH: It does look probably scary to most people, because it's got these dragon attributes of these wings with hands, but it has legs just like we do--very thin legs, kind of like the Ant People. And they have very small wings that are attached like a fruit bat. The arms are part of the wings. And they always have a device with them, and this one was carrying a cylindrical device in its arm, like this, with its claw around it, and this one--this pterodactyl being had an actual claw. It had the long, pointy beak that came all the way back--you know the one that has--the actual bone structure actually goes farther back. And they communicate through a series of loud, high-pitched tones, not like an owl, not like a bird chirping, but just high-pitched tonality.

DAVID: Did you ever see any of these pterodactyl beings while you were in the underground bases?

SMITH: Yes. On the very deep, deep levels of these bases, we were informed that they were there, and they had to do with some sort of consciousness, and I want to say religion, but it's not. It's a study of some sort of history long, and I've forgotten. And they are sent in to--they're like the people who put the puzzles together, are these beings, and they can move things with their mind. They have telekinetic energies, and they can move small things around the rooms, and there might be anywhere from one to four of these beings looking at something, and moving things around in these think tank rooms, they call them.

DAVID: Why do you think they were kept at the bottom of the base?

SMITH: I believe that, because of the way they look, because they do look like a type of flying dragon, and I think because they don't do well with being around a lot of other extraterrestrials for some reason. They seem to need a lot of space when they move around. So there's areas--they just can't walk through a door, leastwise they're very abstract, bulky-looking. And you know, just turning their head, they could--these things can be--just their heads alone could be up to three to four feet long, and just by turning their head they can knock a lot of stuff over. So there's a special place down

there for them that they are allowed to do these, which I don't know what the programs are. I just know they're the thought-thinkers. They're the puzzle-solvers, they call them.

DAVID: I want to run something by you that I've heard from some other insiders. Some of what I've heard--and this is actually from more than one guy has told me this--certain ET groups apparently were worried about a reptilian sentient life on Earth becoming really dominant and aggressive to other species. And the 65 million year old cataclysm that hit the earth apparently was intended to wipe them out. And it was at that time that the moon, which apparently is a used car--and I talked about this William Tompkins--was then parked around the Earth to create a seasonal climate that would allow mammalian life rather than reptilian life to become dominant. I wonder if you ever heard about that scenario of the dinosaur catastrophe being a planned event to wipe out sentient reptilians?

SMITH: I have heard of an event that was intentional to destroy the Earth because reptilians were not allowed on it anymore, because of Inner Earth beings, and also dates back to Atlantis, and Lumeria, and whatnot, that there was this war of some sort, that they were being utilized and used by these reptilians, the Draco, or whatever you call them. And that's what I read in some of the history books in there. But I don't know how accurate that is, because it was written not as a document. It was like someone was just telling you what happened back then. And there has been archaeological finds in the Vatican from this time that depicts reptilian beings destroying Aquifarians and other beings of that time. So I think it's a high probable cause to put two and two together to say yeah, I would agree with that.

DAVID: I'm curious about whether you ever saw something that would look like the Yeti or the Bigfoot while you were working in these facilities, because some people have reported things like that.

SMITH: Yeah, I mean, I have personal experience with the Bigfoot, and the skunk apes, and the Yetis, and all the different types of--I remember in my teen years, around 16 years of age, there was a large white Chewbacca-type being, eight or nine feet tall, and I was camping out in Florida down in south, near the Everglades. And it was probably around 150 yards away. It was far, but it was an open field. It was at dawn. And I just saw this being walking next to the fence line. And it was like five feet higher than the fence posts, which were four feet tall. And the stride of this thing was, like, over six feet. And I literally stopped in my tracks and watched this thing walk all the way across. And when I go back and check the dates--now that there is these things online, you can look for spottings of these extraterrestrials--I've noticed that in the area I was, this being has been seen many, many times by many people, and that was a great confirmation for me. It was greater confirmation for me when I started working in the labs to actually see these beings. These beings have been here a

very long time. They work with the Inner Earth beings. They're here to collect and gather data and DNA from all the living species, and plants, and water, and animals in the water, and fish and everything, and they're cataloging this, and putting it on a type of vault somewhere in order to preserve what Earth really is--kind of a museum for Earth somewhere. And that's why you can never get these guys on film too much, because they have the ability to teletransport themselves at will.

DAVID: Really?

SMITH: Yes. And they can be very mysterious, and get out of somewhere really quick.

DAVID: Well I just want to say this. It is amazing that we don't have a widespread understanding of the reality of Bigfoot given the thousands and thousands of eyewitness sightings, the tracings of footprints, the very bizarre cases of property damage, where fingernail marks have clawed right through vehicles, things like this. Why do you think we have such a hard time accepting these eyewitness testimony as a Bigfoot?

SMITH: Well, you know, these are very large animals. I don't consider them too much human, I'll say. But they have a consciousness, and they have a job to do. And they're probably the lowest-maintenance extraterrestrial that I know. And what that means is they can be dropped on a planet with nothing, and gather these items, and catalog them, and store them somewhere, and then, like the movie "Predator," where they come down and hunt people, and then take all their skulls back. So imagine this guy just coming down and snatching up a bunch of lavender and daisies. [CHUCKLING]

DAVID: So they're not doing anything violent?

SMITH: No.

DAVID: OK.

SMITH: No, they're not allowed to. They're actually prohibited from hurting any type of living creature. So they could take your hair, but they can't take your head.

DAVID: So what you're describing here sounds like a fairly intelligent being. Do they have communication skills? Could they speak, or do they have a telepathic--

SMITH: Yeah, they're the other ones that use their vocal cords to the voice, and also they can do--like elephants have this ability to send these large thumps through the ground, and these things can be heard for miles, and miles, and miles, and miles away by another elephant. So they have that ability, and that's why people here really weird

shrieks. They hear really weird thumping sounds. People usually say it's someone banging on a tree or something, and not so much that. And they can communicate that way too if they, let's say, have a sore belly and they can't use their diaphragm to make these noises.

DAVID: There do seem to be different types of Bigfoot. And so since we're out of time now, I just want to round this out with, do you think that there might be some that are not necessarily on this mission, and are less intelligent, and more primal and dangerous?

SMITH: I've read some documents in my classified, compartmentalized projects that stated that they have--if they get sick or something happens to them, they cannot use their teletransportation abilities, and they get lost or left behind on many planets, and they have to stay there indefinitely. And these are some of the lost ones that are hiding in the--but they're very adaptable, and they like to work alone. They're very solitude-type extraterrestrials that I heard only mate maybe once a lifetime.

DAVID: If they were going to teletransport back to where they came from, where would that be? Do you know anything about their origins?

SMITH: No, I don't know anything about their origins, but I know they know--they have an indistinctive way to trace portals on the Earth--natural portals on the Earth, not man-made portals, that they know where to go, and they might travel vast distances to do that. But they will never go through a city, or they're not allowed to interact with the beings from any planet.

DAVID: Last question, real quick, did you see them in the underground bases? Was there some loophole where they could actually work with us in these classified facilities?

SMITH: I've only seen dead ones.

DAVID: Oh, really? So they didn't actually work in these underground bases with the rest of us.

SMITH: They said--there's some rumors that they have. And I have seen things from far away that look like them. And there is catalogs of them being on the base, but I'd have not worked physically with one.

DAVID: OK, cool. Well, Emery, this is really fascinating. I want to thank you for coming out and giving us all this amazing information.

SMITH: Thanks.

DAVID: And I want to thank you for watching. This is "Cosmic Disclosure" with our special guest, Emery Smith.

A Day in the Life Underground Season 11, Episode 10

Cosmic Disclosure; A Day in the Life Underground Season 11, Episode 10

DAVID WILCOCK: Welcome to "Cosmic Disclosure". I'm your host, David Wilcock. We are here with our guest Emery Smith. In this episode, we're going to talk about what it is like to have a day in the life on a highly classified underground base. Emery, welcome back to the show.

EMERY SMITH: Hey, Dave.

DAVID: We've talked in some length now about your autopsy experiences. We've kind of had an overview of that. So I think you're painting, now, a very intriguing picture. And it would be hard to spend some time in that world and then leave that world. Was there ever a time that you got to stay in that world, that you actually stayed overnight at the base?

SMITH: Yes, yes. Many times I had to stay the night in the base, I think maybe up to 60 times, actually, total. And the reason for that depends. There's many different reasons why you would have to spend the night in a base. They go on lockdown sometimes when you're working there. And you might not know why it's a lockdown. But you're there, they close the hatches, and now you're going to be spending an additional amount of time there other than your work duty time that you do get paid for, by the way, long as you're there. And they have facilities there that are very nice, that you can stay the night, like barracks and whatnot, your own room, your own lavatory, little even social areas where other people can also live. The base, you could actually live there indefinitely. And then getting back to why a lockdown would happen, there could have been a breach somehow into the base from another known contractor or other known entity, and everything gets locked down for a while. And I do recall one time there was a huge explosion that I could actually feel this vibration of this electromagnetic weapon. And I don't know where it came from, but part of the base, maybe a whole acre of the base, was completely destroyed from this explosion. Now the rumors I heard was they were practicing utilizing some sort of electromagnetic weapon, and it completely disintegrated a huge sphere of the base. And there was no radiation or anything like that, but they were just trying to contain the fires and the gas fires that were lit from this explosion because they use a lot of different flammable gases and chemicals down there. So now it became a contaminant issue of locking down all the air handlers in that area, locking down all the valves in the different rooms and whatnot. And you know, that took up probably 20 hours, I think I was there for that one. So these things happen, and you get a nice place to stay, and then you'll just be updated. And you'll hear either over an intercom, on your

folder, or on your armband. And that's what happens.

DAVID: If you get a nice place to stay, how conventional is it? How much would it be like going to a hotel room as opposed to something odd like you might see in "Star Trek: The Next Generation"?

SMITH: Yes. No, the rooms are never perfectly square. For some reason they have trapezoidal shapes. There are many different shaped rooms. And all the furniture is actually built into the wall and actually comes out of the wall if you wanted to have a sit down or work at a desk. It has a huge interactive screen on the wall. The screen is three-dimensional. You can do things like go on the internet, you can read books, you can watch movies, you can order food, my favorite. And it's a really interesting dynamic because the room looks like--when you walk in--completely like, oh my gosh, they just gave me a room without a bed. There's nothing in there. And it's all built into the walls of the room. I'm not talking about your stand in Murphy bed, either, closet that pops out. These are really beautiful. The architecture of this is seamless, just like on the crafts. So these things will come out of the wall for saving space. And these rooms are also used for different things. So maybe the room tonight is going to be used for someone to sleep here and spend the night, and maybe tomorrow it will be used for storage. Or maybe it'll be used for housing different types of extraterrestrial races because they're all different. They need different types of furniture, different types of living facilities and restrooms and whatnot.

DAVID: OK. I'm really curious about one thing. If you're saying that, like, the bed would extrude out of the wall, is it going to be this weird rubber sheet? Or does it actually have sheets like you would have on a typical bed? Like in other words, is the bed with the sheets hidden on like a sliding tray? Or is it more like it just kind of morphs out of something?

SMITH: No, it is kind of industrial, where it actually either comes out of the wall or out of the floor. It raises out of floor, comes out of the wall. And there's always a cover on these things, a very light cover that you pull off. And it has whatever bedding for that race. Like for us, of course, we would just have sheets and things like you said. You also can control the temperature in your room. You can control the humidity because different races need certain atmospheres to sleep in. So there's all these different things. There also needs different lighting. So you can actually put, like, if you wanted ultraviolet light in your room for some reason. Many extraterrestrials have special lighting that they are accustomed to. They don't like the lighting that we have. It's uncomfortable for them. So they can take off their protective eyewear and rest and whatnot. So there's many different things for this one little room. It's like having your own little spaceship, actually. And you can also change the background noise. And there's always a wall in there that projects, let's say, an outside display like the ocean or a mountain top, and it's because

psychologically, it helps us better to be in that environment and less stress and anxiety to be on the body. And you can also preview other photos that are already there, and videos that show on the wall from other realms and plants, which was really neat because not everyone that's not from Earth would want to see a beach, I'll say.

DAVID: This sounds like something that you'd really want to spend time in. It sounds really, really cool, being in this room. Were you able to sleep, or were you so jazzed by seeing alien worlds and technology that you just want to stay up all night just play around with it?

SMITH: Well, Yeah. It's like your screen saver. All these pictures come on your screen saver with your computer. And once you've seen all 50 of them, it's like old hat. It's not a big deal. So where you want to pick today? What screen do you want? The neat thing about sleeping is the bed is actually also self-contained. So it'll have like--on the sides of it, it actually comes in like a spiral, and it's like a little globe and it comes over your bed. And that is for more with other races, where they have to have the environment pressurized for their body types. And inside that, which is neat, is kind of like you see the generic mood lighting you would have at a restaurant or whatever. There's these little diagrams on the inside of the bed, like right on the side, on the top right side. And it's like a little computer screen, and you can pick your moisture. You can pick your mood lighting. You can even pick a breeze of stuff. And I don't know exactly where it comes from. I think it comes from under the bed, to be honest, because I've never seen a fan on this. But you do feel circulating air, which is neat. And then you can also change the temperature in there compared to what's on the outside of the bed. So it is actually air tight because you can create a vacuum in there.

DAVID: So let's talk about the lockdown situation a little bit more. How do you know that there is a lockdown, first of all? Is there like an intercom system, or what happens?

SMITH: Well, as you're working in the operating room, don't forget there's a system in there where they are always in contact with you through their helmets. So you can hear if something's going on. You know, they'll come on and say, we have a lockdown. OK. It's not like I can respond to that. Can't ask them why, where, what. You know, it's all because of security. And it's a normal thing. And they'll do fake lockdowns all the time just so you get used to the alarms, you get used to the red lights, you get use of these things that are signaling you so you don't overreact. Oh, it's just another test. I'm going to keep--so it's just like we have fire alarm checks in hotels and hospitals and airports, you know. They have to do that every now and then. And sometimes you get used to that because you once a month it happens. So when it really does happen, and all of a sudden you don't hear within a few minutes that it's just an alarm check, then you might think, oh, there must be something going on. I

guess I'm not going home tonight.

DAVID: But somebody at some point briefed you on what a lockdown is and the level of danger that it might be. So could you tell us about how that information was conveyed?

SMITH: Well, you have to go through the training. Part of your training in here that you have to do quarterly--like in hospitals you have to get TB tested, you have to have your CPR accreditation every year. It's the same thing in these test facilities and the real facilities. You have in services where they're saying this is what happens on a lockdown. You stay where you're at. You don't go anywhere until we tell you where to go. If there's an over hour lockdown, which means it goes over your business hours, your working duty hours, then you'll be instructed to go to a certain part of the facility where you can go into your room and maybe get something to eat at the cafeteria, or just kind of waiting it out, basically, is what you're doing.

DAVID: Could you tell us a little bit about the cafeteria, because when I hear cafeteria, I think of trays, and you go and you have scoops of food. You dump them on your thing. Or maybe somebody does that for you, say, I want that, I want that. Then you go to your table after you got your silverware, you paid a cashier. How would this cafeteria be like that, or is it different?

SMITH: The cafeterias are nothing like we have here that we would normally see when you go out to eat. These cafeterias are very plain on the inside. All the walls have a transparent mirror image coating where you can just touch the wall, order your menu of whatever you want. And let's say you wanted to have a salad with grilled chicken. That'll be on there. And it's just like when someone's taking your order. You're taking your own order on this wall.

DAVID: Would this be like an iPad kind of thing?

SMITH: No, the entire wall. And these walls are huge and long. Some of the cafeterias there are like 60 feet long. And they have very--the chairs and the tables look so bland, kind of like a steel picnic table with stools. And some have backs, some don't. Some are very large chairs, some are very small for different sized people and different sized races. Some chairs don't look like anything like chairs. Some have large countertops off the actual wall that extend like three feet out of the wall. And some of those might be six feet off the ground. So that being said, it's all a very intuitive program when you go up to the wall to order whatever you want. So if you're getting your chicken salad with your chocolate milkshake, you put the order in and you go down to the side of the wall, and it'll be there on the inside. This glass will kind of move up, and then you can see the food there, and you just grab it and take it to your table.

DAVID: There's something I'm not visualizing, though. And that is are you saying that there's just a huge number of different pieces of text of all these different types of food? Or can you click on things and open up folders?

SMITH: You can click on it. They have a picture method of a diagram of different types of vegetables, different types of meats and things like that. And the entire wall does it. So let's say you're taller than me, and you would touch the wall with your hand. And then it just comes clear. You can see a screen around you. And it can do it all the way on the floor. So there's not a specific--wherever you touch this wall, this thing happens where you can actually place this order. And this is just one cafeteria of many different kinds. But this is a really fun one. That's why I want to talk about this one specifically because I think people will relate to this, people that have been in the projects. So here we go. So you get your food and you go down a little bit. And in the middle of the wall, there's a big section that's open, like you could see a dishwasher person in a regular cafeteria where you put your trays in and stuff to wash. It's the opposite. This is where the food is actually brought into this cubbyhole. And what's interesting is there's also levels of the cubbyholes of sizes off the floor for different races and for different people. And from there you just take your food to your table.

DAVID: Is it on a tray?

SMITH: No, it usually isn't.

DAVID: It would be like a plate, then?

SMITH: Yeah. It's a large plate with everything on it. Not a TV dinner. Now they do have trays there if you want. But no one uses trays. You just grab food and take it to the table. And the table is the best thing about the cafeteria. I love the table because the table is another giant screen. These tables are 10, 20 feet long, about five feet across, five to six feet across. Some have already pre-positioned chairs at these tables. You can fit 10, 20 people sometimes at a table, depending on the people that are sitting there. And then there's tables that are just tables. And out of the actual ground, as you're going up to the table, you just start to sit down and a stool comes out of the ground. It's really neat. And it doesn't look--like you would think you would hear a sound of [MECHANICAL SOUND],, like your stool's here. It just comes out of the ground silently. But they're all very similar sizes. The ones that come out of the ground are pretty much a normal, maybe, foot and a half in diameter. Everyone knows where your silverware is. And your condiments and all that stuff is in the table. So you have this giant picnic table, we'll say, and it's all made out of steel. Looks like steel. Not stainless steel, like a matte steel. The table itself looks like you're eating off an iPhone screen. I mean the table itself. So when you put your hand out in a special motion, like flat hand is napkins, double tapping is forks, knives, and spoons. The actual napkin, as you go like this, comes out of the table into your hand. And I have

no idea what this technology is. But there's no sliding anything. There is not a door opening up and these condiments come out or anything like that. It's all just on tapping and pulling your hand across it to get something out. Now if you don't know how to do that, which they do teach you different things to do, you can actually hold your hand on the table and a little intuitive apps will come up. And it'll have a picture of a ketchup bottle, a picture of mustard, barbecue sauce, and all these little pictures. Everything's pictures. There's no words. And you can touch and tap on the ketchup bottle or whatever, and the same thing happens. Whatever's underneath this table, it becomes not solid in that area where the condiments are. And it starts to become clear, the table, where you can see the condiments right underneath your hand.

DAVID: Are they like little ketchup packs like you get at the restaurant?

SMITH: Same stuff that we use. The same stuff you probably get at the fast food restaurants. I don't use condiments, but--definitely this is one of the things that I was so intrigued about, and everybody was, because this technology could be used for a lot of better things. Like we could use that technology in surgery. But for whatever reason, this is how it is, and there is palpable. So once you take your hand off, it becomes solid again. And this is probably one of the most amazing technologies that they share with everyone. But no one's allowed to know how it works. You can't ask--there's no one to ask. That's another thing, You're not allowed to ask about technologies. You're not allowed to ask certain things about your room. You're not allowed to ask about why does he have this special folder and you don't. And this is a really interesting concept of high tech stuff that's way advanced compared to what we have right now here that should be out right now, but probably not because it would be dangerous.

DAVID: Well, you said that this is napkin, right? Down and out is napkin. Double tap is for condiments or silverware.

SMITH: Silverware.

DAVID: Or silverware. So were there other gestures like that?

SMITH: Yeah, there's different gestures for your hand, especially if you use--double tapping, too--I'm sorry, I should tell you double tapping means you have to use at least two fingers. And there's nothing more than two fingers. But you can also draw on the table. Let's say you needed a special utensil because there's different utensils for different races, which is really interesting. And by putting your whole palm on the hand, then you get to scroll through that little app, and you can pick a special utensil or special whatever. The other thing I must tell you is that where the napkins is different than where the condiments come out, which is different from where the silverware comes out. And the silverware is always going to be on your left, and the

condiments and napkins are on your right. And that's all it does is those types of things.

DAVID: Did you ever think that there might be some sort of particalization or materializer technology making the food? Because I've heard from a lot of other people that have been through similar things that they could quote, unquote print a meal.

SMITH: Absolutely. All the food and everything that they have there that's of substance--not drinks, though--but everything else is 3D printed.

DAVID: Really. Do you know anything about whether there is a raw material that's required to make the food that they start with? Or how does that work, exactly?

SMITH: Well, through my experiences working with 3D printing of organs and other projects I've been involved with, it has to do with, like you said, the particles and the atomic structure can be reproduced anywhere for a head of lettuce to a brain, which all has the same construct. It's all mass and atoms and how those mass and atoms are rearranged in molecules. So basically you can probably print anything. That's why it's so easy for the system to make any kind of food you want. They also have this device that the food goes through after it's printed in the back that is able to cook the food to a certain temperature or cool it to a certain temperature, which I find fascinating. But it does it within seconds. So medium rare, seconds. Below 32 degrees, seconds, because each meal is made in under, like, three minutes. And that's how fast these 3D printers are. And you can hear them behind the wall.

DAVID: Really.

SMITH: Yeah it's very archaic noises like servos going back and forth and ring, ring, ring, ring, ring, ring, ring. And then, you know--

DAVID: One of my space program insiders who never has been willing to come forward is named Jacob. And he described very similar things. But he also said that the food has some extra benefits that normal food wouldn't have. And I don't want to lead you, but could you tell me if you knew anything like that?

SMITH: Yes. That's the great thing about the food there. It's over nutritional. What we have standards here on the back of boxes and things, it's just horrific that they could be doing this--you know adding, a little bit more vitamin C to something, or adding a little bit more minerals to something. They do the least amount here out in the real world. But in there, it's the opposite. It's like super heavy doses of all sorts of minerals and things that are not found the surface, is what we say, and also takes away things that are harmful in there, like toxins and fats. And it's printed without any of that.

DAVID: Jacob also said that this food could clean your mouth as you eat it and would digest into pure nutrition in your body. I'm curious if you had that experience.

SMITH: I don't know that for a fact. I just know what they've taught me and told me there about the nutritional value of the food, it's the best of the best. And there's nothing in there that's put in there to--you know, we are an investment to these corporations. We are a huge investment. And they take really good care of us as far as nutrition, medical, and things like that, unless you make a mistake.

DAVID: Some of the people I've talked to about this printed food--not all of them--some of the insiders have said that it is the most amazingly good tasting, flavorful--like each meal is the best possible realization of that dish you could ever imagine.

SMITH: That is true. It tastes better than anything I've had on the surface. And I think that has to do with the quality of the cells or whatever that they made the food from, and the amount of nutrition that goes in there. And being able to print food without the bad things that are in normal meals, pesticides and whatnot. There's none of that. I mean, this is the purest apple you're ever going to eat in your life. And there were some sort of enzymes and things they add to food. So like your friend said, it will digest immediately into the system, and you won't have as much digestive problems and things like that. That is absolutely true.

DAVID: Let me share another thing that Jacob said that I think is interesting to add here. His people in the Secret Space Program were worried that we might become dependent on this super nutritious food. They looked at the physiologies of certain ETs, like some of the Gray types, and it's literally like an esophagus that goes right to the anus. It's just like a tube, a straight shot, no intestines, no stomach. And they were worried that perhaps if we don't use food the old-fashioned way, that our systems are not going to be able to survive anymore unless we have this type of food. Could you comment on that?

SMITH: Yes, I can. I believe what's happening here is the actual body really doesn't need food if you can create the energy it needs, the cells and the genetic disposition of your nucleolus and of all the cells in the body. And that's why some people can go years without eating. They have mastered that energy. With a lot of the ETs we've seen from the far future, they barely have a mouth. They barely have a nose. And the reason is over time we will not be eating any more. It'll just be something you do for fun on the side to do that. It'll be just like a social thing because all the energy that your cells need, you can teletransport into your body. We're starting to do that now with chemicals, with IVs, with vitamin IVs, all these things. So I do believe it's going to go to a route where we won't have to eat any more. And that being said, the body, over millions of years, will adapt, and some of the organs will not be needed because the foods will be so pure you don't need your liver and pancreas to add enzymes, and

your gallbladder to break down the food because it already has it in the nutritional value of the preprinted food.

DAVID: Were you ever able to have contact with the outside world once you got in there? Or obviously, they're not going to give you a telephone or anything.

SMITH: No. It's heavily monitored. Even the internet, there's no cameras so you can't do a FaceTime or something like that. You have to understand, back then a lot of this stuff really wasn't out there like you guys have now. It was really--early 90s it was just at its beginning stages with the computers and stuff. But you had ways to go on and watch things, listen to things, but mostly just for entertainment. You are not allowed to communicate with anyone. You are not allowed to have a mobile phone. Back then I didn't have a mobile phone. We had beepers. And no electronics you were allowed to bring.

DAVID: It sounds really like a wonderful place. And I'm curious if you could request to stay there if there wasn't a lockdown. Could you get to a certain level of clearance where they'd allow you to do that?

SMITH: I'm not aware, In my facility, of anyone being allowed to stay there just because. There would have to be an event that they asked you to stay, or something went wrong where they had a lockdown. I wasn't authorized to just say, hey, I want to stay a month here and hang out. No, not at all.

DAVID: What was the longest time that you got to spend on lockdown, because it sounds like it's not really a bad thing.

SMITH: I was there almost a week, about six days, on one lockdown. And it was just because of lockdown, my area was damaged. So I actually wanted to work overtime and extra time to get caught up for--sometimes there are deadlines to get things done, and I was working on a really interesting project, so I wanted to stay, I wanted to get it done. I had no problem staying the extra time. I didn't really have too many friends and family. This was my life. This is how I lived. And by doing that, it also shows that you're really willing to help and be there. Sometimes they give you a choice. You have a choice. You can stay and finish the project, or you can at least work eight, and then you can leave and come back. But please come back. I didn't want to do that because I could work an easy 12, 14 hours and not be tired because the air quality is great. The water is fourth state of water. The food is highly nutritional. And it was just like you said. It was a place that was interesting, and for me, exciting to be part of such an amazing thing. And every time I ever went back to work I learned something new. I would learn things about the new races. I would be able to overstay my time in the library, which was really important to me.

DAVID: Was there ever a case of a lockdown where everybody was genuinely

terrified, and some knowledge of what was going on did seep through? Or was it always just oh, we're on lockdown again. I don't know what this is. And that's it.

SMITH: No, there was a couple of times like that. It was kind of frightening when a major lockdown happens and you don't get to know what's going on. And then you have to stay a night, just like one night. And then usually you find out why it happened, or they'll just send in a disinformation campaign and say oh, there was a fire or something, something so generic you know they're lying to you. But that's the excuse to help you relax and wait for the fire to go out, we'll say. And a lot of these things, we didn't know what happened. Usually if you stay on the projects long enough, you'll find out like nine months later or a year later, oh, that's why we were on lockdown back in January for two days. Wow. Someone left with a virus or something and they had to cleanse that whole wing. And when I say cleanse, it's not good, because whoever's in that wing has to be terminated.

DAVID: Well, this is extremely fascinating. And I'm sure, like many people watching this, I hope I get to see stuff like this one day. If we do get any type of real disclosure, what an incredible journey that will be for us as a civilization to start to get to use technology like this.

SMITH: Absolutely. I would love to take you in there.

DAVID: Well, maybe we'll figure it out. I want to thank you for watching.

Rise of the Moss-Man Season 11, Episode 11

Cosmic Disclosure; Rise of the Moss-Man Season 11, Episode 11

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. I'm here with our special guest, Emery Smith. And in this episode, we're going to walk through what happened after he left the underground base. Emery, welcome back.

EMERY SMITH: Thanks, Dave.

DAVID : Let's now talk through how your assignment with these autopsies ended. First of all, you had mentioned before that about every four months you got another security clearance. And I believe you said that you had stopped at A22. Is that correct?

SMITH: That's correct.

DAVID : OK, how many cycles of this autopsy tour of duty, if you will, did you do? How long were you actually--

SMITH: About 22--about 22 quarterly advancements. I never failed to get an advancement every quarter. So it took about on average of 4 and 1/2, 5 years. I finished my active duty in 5.5 years.

DAVID : Now, did you continue to do your cover job the whole time you worked down there?

SMITH: Yes, I stayed an additional two quarters, actually, after I got out of the military. And then things started getting a little different down there because--I think I told you this once before--I started getting bodies that were pretty warm. And I could tell that they're very recent by the rigor mortis that barely set in. But after I finished my work with the United States Air Force, I decided to stay working in the underground labs of Sandia and Los Alamos.

DAVID : Did that allow you to have more hours since you didn't have coverage--

SMITH: Absolutely, it sure did.

DAVID : So tell me the difference between a shift that you would have had. Like, walk us through your typical day before you left the Air Force to after you left the Air Force. Like, how many hours did you work? Where did you go? Just so we have a sense of that.

SMITH: Yes, my work started at 5:30 AM at Kirtland Air Force Base hospital. We worked till about 2:30 to 3:30 PM, and then I went into work at 7:00 PM at the underground location. And I would stay there, usually, anywhere from four to eight hours. And then just go home and repeat that anywhere from five to seven days a week. The active duty job at Kirtland Air Force Base, I only worked Monday through Friday pulling emergency trauma call usually one weekend a month. And during these times, by pulling call, I was not allowed to work in the underground bases because I was not allowed to have a beeper and beepers don't work down there.

DAVID : So once you left the Air Force, what was your schedule like in the underground base?

SMITH: It was great. I kept the same hours because I liked working evenings. I'm a night person, and I'm very productive at night. So I'd go in around 5:00 PM and be out of there by 1:00 or 2:00 AM. Sometimes, I would have to stay longer. Sometimes, I had to spend the night there. And I started transitioning over from doing the harvesting and autopsy work and moving more in the direction of biologics and was part of their biological warfare division where they were making all sorts of--types of things, to control viruses and to also deploy viruses around the world.

DAVID : Well, certainly in terms of known international agreements like the Geneva Convention, we're not supposed to be using conventional chemical weapons or biological weapons.

SMITH: Correct.

DAVID : But this clearly sounds like they didn't care about that.

SMITH: Yeah--no, it was a total disregard for humanity, and they were trying to figure out how to make a virus that was very specific to your lineage. And they would deploy these via using contrails with the jets. You heard about these conspiracy theories. And that's one way they would do it, was just to spray a city. And let's say they could get the lineage DNA from a specific ethnic race maybe, and if you had that genetic code in you, it would wipe out all that race, all that part of the human race.

DAVID : Well, clearly nothing like that's actually been done because we're all still here.

SMITH: Correct.

DAVID : But they were trying to find things like this?

SMITH: Yeah, and they took extraterrestrial DNA--some extraterrestrials a long time ago could program their leukocytes and monocytes to combat certain genetic races.

So if you programmed your leukocytes and white blood cells, neutrophils, and whatnot to attack someone like me, and I was a different race, you would just have to come up to me and your body already has a virus in it which your white blood cells are OK with. And by touching me or sneezing on me or communicating with me somehow physically or airborne-wise, you could give me this virus, and it would kill me.

DAVID : Well, I could see skeptics attacking you on this point because leukocytes would involve--they would need to involve blood to blood contact I would assume.

SMITH: The leukocytes are protecting them from my virus. So if I have a virus and you know you have a virus, we can't really fight each other or touch each other cause we'll die. So those leukocytes were ramped up to fight this specific virus that I'm going to give you. So once it was airborne or transmitted through any blood pathogen wise or whatnot, it would get into your system.

DAVID : I still don't really think I've heard you say why they would--how would they justify designing an ethno-specific virus. What was the angle--what would they tell you about why this was necessary?

SMITH: I was told there's some religious organizations and factions out there that are actually trying to do this. And just in case one day, there is some sort of mass extinction, barely killing almost more than half of the population, and they wanted to get control over it. And if they had some sort of gender, race beef with somebody, and they wanted to get rid of a certain type of race, that's how they would release this.

DAVID : Wow.

SMITH: Yes.

DAVID : Were they trying to develop it for every type of person on Earth?

SMITH: Well, I don't know that. I know this because I heard scientists talking about it. And it wasn't in a briefing that I read, I've actually heard the scientists talking about this type of technology. And I was in a lower echelon part of the base once I got out of my active duty service from the military and was working on growing proteins and things.

DAVID : Well, this is very disturbing stuff and I'm curious as to what stories do they tell people who are working on this to make them feel like they're doing a good job, or they're serving their country. What was the angle?

SMITH: The angle for that is most of them do know they're doing this. And I know some scientists that have been in these projects that had a change of heart halfway

through. And these scientists, sometimes, if they try to get out and they're that deep in, they will make sure that you can't get out. And they will inoculate you with things, so if you did return to the surface without getting the antidote, you would die from sunlight.

DAVID : Really?

SMITH: Yes, and this is how they keep control of the scientist. Many of them have families on the outside, and they get fed up with some of the things that are going on because they're afraid that if something did happen, it would maybe affect their grandchildren or their daughters and sons. So they are starting to stand up now, the scientists in here. And they're starting to fight back. And the white hats out there, the Cabal are also getting a little bit upset about the small percentage of the Cabal that is kind of death and destruction.

DAVID : OK, so let's now go through how your time working in the underground base ended. You had mentioned something about that warm specimens came in. Did you decide that you wanted to quit and submit resignation? How did this happen?

SMITH: Yes, that's exactly what I did. Just like you would with a normal job, you have to fill out a lot of paperwork, and you have to be tracked for x amount of time. Mine was 20 years after I got out that I had to be willing to come in for questioning if needed. Or if I had surgeries, I would have to notify them. If I was traveling to hazardous locations, I would have to notify them. There was different types of lists of things that you had to follow in order for you to have a nice discharge from the underground civilian lab.

DAVID : When Pete Peterson's wife died, the people he'd been working for brought him in for an extended two months debriefing because they were very worried that the emotional trauma of losing this woman he was very attached to might cause him to start talking. So did they monitor your life for these types of crises and could you end up getting brought back in if something happened?

SMITH: Yes, absolutely, they did. And it's happened even after my 20 years. I was approached even recently after my mother passed away last year. So yes, they do keep tabs, and it doesn't bother me at all. I mean, I know they're always looking anyway. There's no sacred secret conversation on this planet, that's for sure. Because everything is recorded everywhere, and they've had that technology when I was there. So that was 20 years ago that they had the technology to record all the vibrations on the planet and every voice.

DAVID : You've probably heard about these satellites from the National Reconnaissance Office that are constantly recording the surface of the Earth where everybody is and have enough resolution that they could actually read the fine print

on your driver's license if you were just holding it in your hand.

SMITH: Good grief that was in the 1960s, sir. You know what we can do now? We can see what's inside the walls. We can see what kind of termite is eating inside your wall. And that's public information now that they're doing in South America. Big corporation usually using that something, using that technology for spying. But now they're using it to make money to support their other agendas. So, yeah, these things have been around for a while. And you can go pretty much anywhere on the planet in 40 minutes with these satellites and get HD 4K pictures of anyone, regardless if there's cloud coverage, and also get a wave form back of exactly what it is.

DAVID : Wow.

SMITH: Yeah.

DAVID : So let's go to the point now where you filed all this paperwork and you get discharged. What is your life like immediately after you left this job? You're not in the military anymore, you're not working underground anymore. Where did you go? What did you do? And when was your next contact with the classified world?

SMITH: Well, actually, I stayed in contact with the classified world in a medium state, which means if there is a project coming or people are coming that you're needed because of a very specific special thing, then I can go back and do a couple weeks or a week work with them. So I actually kept my clearance. And that you have to do twice a year. You have to check in and re-get your clearance and whatnot. But from that point I stayed in New Mexico another couple of years, and then I went back to my hometown in Fort Myers, Florida to take care of my family. And my mom and dad were not doing so well.

DAVID : Well, but what did you do in New Mexico? Were you employed do you have a job?

SMITH: Absolutely, I'm sorry. So after I got out of the underground projects, I stayed in New Mexico for an additional couple of years and was working at the University of New Mexico hospital as a surgical first assist.

DAVID : During those couple of years you said they would call you in at least twice a year for these checkups.

SMITH: The twice a year is like keeping your clearance verification updated, because I would take at least maybe four days a month every now and then work in the project still.

DAVID : OK. What types of assignments were you doing at that time? Could you

walk us through one example of you working for four or five days after you had left the base full-time?

SMITH: Yeah, at that time I was just working with cells and culturing cells, not of Earth origin cells, I'll say, but that were very alive and well, and growing cells in Petri dishes. So nothing too exciting. I moved away from all the autopsy stuff because I just--after having a couple of these beings come that were warm I just had a really different feeling. And then after meeting beings and seeing how beings are and not knowing any stories that I was not privy to, I just didn't feel like it was right anymore. You know, to be part of that.

DAVID : So let's go now to how did you get to Fort Myers, and did you continue to interface with this classified world, and through what means.

SMITH: Yes, I did. I stayed in contact with them and checked in twice a year. And just a few times they had some questions about some extraterrestrials that I had worked on in the past.

DAVID : Did you have to travel back to New Mexico?

SMITH: Yes, yes, I did.

DAVID : And how did you that?

SMITH: I just got on a flight and traveled back.

DAVID : OK.

SMITH: And the same thing, I would stay off base and would come in in the mornings, actually, instead of the evenings and get my duty paperwork and show up to the gate at Sandia, and then actually go through a different location that goes underground through there, and not the same location. I don't know why they changed it once I got out. Maybe they just changed locations for their own reasons. I have no idea.

DAVID : Did this means of entering the base have anything different from what you described was before? Or was it just a different door?

SMITH: No, it was a little different because now I'm working with biologics that are very dangerous. And you actually have to be monitored before you go in and after you go in through these special analyzers that you have to walk through. So you have to go through this area to get cleansed. And one of these things would be called a dry plasma shower. And the dry plasma shower basically was taking samples and killing surface bacteria that was all over you, that you just normally have. And it also

somehow counts particles on your body to see if they resonate frequencies of known bad cellular material.

DAVID : Could you wear clothes while you have the dry plasma?

SMITH: Yes. Yes, you can. You can wear clothes. On the way out, though, you have to go through that with no clothes. There's another one that you have to go through that after you change in the locker room, and it's up to you if you want to do it, but it's a protocol. It's like not made for you to do, but everyone does it. We just do it as a precaution. There's a very small percentage that you may have had something when you leave those. Not to say something is a bad something, but something you could have picked up from somebody else.

DAVID : So I assume that your outdoor clothes are quarantined on the outside, and your indoor clothes are quarantined on the inside.

SMITH: Correct. Yes.

DAVID : OK. So give me an example of a specific extraterrestrial species that you had autopsied before that you were called back in for more consultations on later. Tell us what it looked like and why did you get called back?

SMITH: Well, they were mutating a bunch of extraterrestrials. So part one of the extraterrestrials that we were actually working on looked like a smaller human being, kind of troll-like. But it also had plant DNA in it. And it was very--it would probably remind you of one of those ghillie suits that snipers wear full of moss and leaves. So think of a 24-inch to 36-inch tall troll-like being that has, instead of hair, it has real plant life growing on it.

DAVID : Wow.

SMITH: Yes, and it also uses the energy from UV light to keep it healthy. And it actually absorbs moisture through its skin and it's very mossy like. And I've seen many of these--it looks like a wig, like hair, but they're so extremely mossy, like It on "The Addams Family," that you cannot see its face unless you actually started pushing away the plant life that's growing on this creature.

DAVID : Would this plant life cause it to feel physical pain if it was removed?

SMITH: No.

DAVID : Or was it more like body hair?

SMITH: No, it's more like body hair. But the closer you get to where the stem is, the

more nerve fibers and neurons that are in it. So neurologically, the plant life has binded and mutated with real cellular material. That was a human and an ET.

DAVID : I can't read your mind about why you say it's troll-like. Was there something about its face that was unusual? Could you describe exactly what?

SMITH: Yeah, I can tell you that on the face and neck of these types of creatures, it's like a bark on a pine tree, and it's very rough and cracked-like, very cracked. So if you could dry a gray piece of clay in the sun, and you know how it just crumbles and cracks away, that's exactly what it looks like. But they do have nose, they have a mouth, they have ears, and they have eyes.

DAVID : Well, a troll, for example, somebody might think of a really pronounced lower jaw with two teeth coming up like this or something.

SMITH: No, no canine teeth like that. Just regular teeth. And the insides are red and pink, like our mouths. And they have a tongue, and they breathe. It's just they get a lot of their energy from their skin.

DAVID : Do they have this plant life growing off of their face? Or is the face area, if you pull it back--

SMITH: Just the face area is, like I said, it's this crumbly, crackly, bark-like hard core, very tough looking face, very rigid, with no muscles in the face that you could tell for them to smile. Or they can open their jaw and things like that. But no facial features that you could really tell because of the roughness of this skin.

DAVID : What were the facial proportions like compared to an Earth human?

SMITH: The head was much larger than the body. So you're looking at a head that would be maybe just a half a size larger than our normal head.

DAVID : What about the relationship of the size of the eyes, nose, and mouth to the face?

SMITH: It was very compact because you're looking at a 36-inch being here. So if you think of someone has dwarfism, for instance, around that size where the legs and the bones are a little bit more compact, if not long and lean like ours are. And they may have this moss growing all over their body. And you might even have leaves and vines coming out of the bodies, especially on the back. The most pronounced is on the back where you have these vines and you have this moss growing off them. And then you have just the regular green moss you see growing on rocks on a stream, let's say, on the rest of the body. And very, very small hands and very, very small feet.

DAVID : So you're saying that this is not a natural species, but this was an engineered life form?

SMITH: Correct.

DAVID : Why would they want to make a vegetable/hominid being? Is it for covert work to conceal itself?

SMITH: It is. It's for covert work. They can go weeks without eating, as long as they have sunlight and water. They can make their own nutrients through this plant interaction with cells. And it's very fascinating science, by the way, of how that all is intertwined. But they did it.

DAVID : Did you ever get to see or interact with a live moss being, as we can call it?

SMITH: Yes, absolutely.

DAVID : OK, how did it communicate?

SMITH: It communicated with its hands.

DAVID : Really?

SMITH: Yeah, a type of sign language, yes.

DAVID : And what was the feeling that you got from it? How was its level of intelligence, its level of ethics, its consciousness?

SMITH: I hate to say negative, but it is a creepy, spooky type of being. And it's very quiet and it's very docile. It reminds me of a chameleon that just kinda sits there and moves kinda slowly, like a sloth. And they're not very hyperactive beings. They're just a very slow type of being. And they are taught from what I was told--I don't know this for a fact, but I was told through second-hand information that they were taught at a very young age how to communicate because they lack vocal cords.

DAVID : Oh? So their face doesn't move very much? You said it's very hardened?

SMITH: No, it's very hardened, it barely moves, but they can chew.

DAVID : Do their eyes look like ours, or is there something different about the eyes?

SMITH: They're black.

DAVID : They're black?

SMITH: Black eyes.

DAVID : Really?

SMITH: Yes.

DAVID : Wow.

SMITH: There is no pupil, you cannot see their pupil. They're pitch black, which does frighten some people.

DAVID : So what would be the objective? If they were going to deploy these beings into the field, would these beings actually be used on the surface of the Earth? Would they be for surveillance? Would they be trained to assassinate people? What would they be doing?

SMITH: Not to kill. They're not that adept, but definitely for surveillance. I mean, what better creatures--one that can't make a sound. Engineered that way, by the way.

DAVID : So give me an example of where the military industrial complex would deploy a being like this for surveillance purposes? Obviously, it could camouflage very well.

SMITH: I can only speculate.

DAVID : OK.

SMITH: I was not part of any deployment program to spy on with them. So alls I can say is, you will not know one if you even stepped on it. I mean, they're that covered in whatever. They can add foliage to the mossy skin, by the way. So let's say they're going to an area where it needs these types of colors. So they can get fungi and different types of moss and implant this on the body, and it will grow into that skin.

DAVID : Really?

SMITH: Yes, which is fascinating. So they can pretty much mask any type of field grass, any type of trees around the world.

DAVID : So part of their body would be like soil and you could actually plant things in it?

SMITH: It's not soil, but it's a honeycomb matrix of collagen tissue that can hold water for many, many weeks. It's like a skin. And it's embedded in the skin and comes out of the skin, just like a honeycomb, but very small, on a very small size, micro-millimeter size.

DAVID : So had you first encountered these beings while you were still working full-time in the underground base?

SMITH: Yes, I did. And I think because of these beings coming from an Inner Earth place, they were somehow able to grow things on them already.

DAVID : Oh, so you're saying there was an initial stock of being that they got from the Inner Earth that they modified.

SMITH: And they mixed it with more plant life and made it more into this robust creature. Yes.

DAVID : So had you seen them alive back when you worked in the underground base? Or was this more of an autopsy situation?

SMITH: I've seen them grown, yes.

DAVID : How would they be grown?

SMITH: In a big glass aquarium type-thing with UV lights, suspended off the ground about three feet on these planter-type things.

DAVID : So since we're almost out of time here, I'm just curious if there's anything else interesting about the moss being that you could share with us?

SMITH: Absolutely.

DAVID : It's so bizarre.

SMITH: One of the most amazing things is these things cannot procreate.

DAVID : Oh?

SMITH: They do not have organs like we do, but they do make seeds. And these seeds have DNA in them. Now it's not full of human tissue, OK? It's still all plant life. Yeah, and I saw a collection of these seeds in an incubator when I was leaving. And one of my colleagues was talking about they're doing a new experiment on another type of one of these moss beings. And I asked why the clearance for you to talk about it were very open. He goes, no, but I can show you the new incubators that were brought in. And we were walking by and I just remember looking through this giant three-foot circular window and there was a seed in there as big as you, a lot of them.

DAVID : Wow.

SMITH: And I really was just taken aback. And that was it--I mean, I wasn't even allowed to know anymore. I was even allowed to speak.

DAVID : Is it your understanding that the seed could somehow be gestated and become another one of these beings?

SMITH: That's what I'm thinking, or where did that seed come from. What dropped that seed?

DAVID : Right.

SMITH: I mean, they're up to some amazing things in there. And there is no rules, there's no regulations.

DAVID : So could you tell us what was the reason why you were called back in after you had moved to Fort Myers to deal with this specific being again? What had happened or what was the reasoning behind that?

SMITH: There was an incident on the lab and the team was destroyed.

DAVID : An incident? Could you be a little more specific?

SMITH: No.

DAVID : Well, I would imply from what you said that there was some sort of hostile interaction with one of these beings.

SMITH: No, not from the beings.

DAVID : Oh, OK. So for some reason this is something that you really don't want to tell us, or you were ordered not to say. Is that correct?

SMITH: I just can't, it's just too much. I know those people, so. It's too hard for me to talk about.

DAVID : OK. Can you give us another example of something interesting that you were called back for when you were living in Fort Myers?

SMITH: I did go back just for the normal tissue sampling a couple of times. And it was just because they were short on technicians and short on staff. I know there was an outbreak one time in the facility, and 20% of the facility people caught a very rare virus. And it's like the hantavirus, I don't know if it was the hantavirus. Sorry, I don't know if you guys know about that. And there was an outbreak of that in 1993. And there's a virus.

DAVID : You're talking about the hantavirus?

SMITH: And that virus, that was actually made in that facility.

DAVID : This is the flesh-eating bacteria?

SMITH: No, it gives you more flu-like symptoms to death pretty quickly.

DAVID : Wow.

SMITH: And you're ferociously vomiting and diarrhea, and your lungs start to shut down and it's hard to breathe. So there was a similar virus like that that actually broke out in the lab and people were deathly ill. Almost 20% of the biologics area was so sick and they were not allowed to return to service. They had to go to the hospital, the underground hospital, and be quarantined.

DAVID : Wow. Were there are a lot of casualties?

SMITH: Yeah, there was. Half of it, 20% passed.

DAVID : Oh, wow. So you were brought in because of your expertise on this to try to help stop the outbreak?

SMITH: No, I actually was just going so they could keep working, just normal work.

DAVID : Oh, you were just like a fill-in.

SMITH: I was just a fill-in, just PRN.

DAVID : I'm curious--in just the last couple of minutes we have here, we've talked about some negative uses of this, but I'm wondering if this same technology could be used for positive purposes. And if so, do you have any specific knowledge about that?

SMITH: Funny thing you asked that because part of this story I had to return to New Mexico because of this outbreak of a virus that was made there that 20% of the people contracted. They designed a virus to kill that virus.

DAVID : Oh, really?

SMITH: And save the other 10% in less than a few days.

DAVID : Oh, wow.

SMITH: And it's really hard to make a whole new species of bacteria or a virus in just a couple of days.

DAVID : Wow.

SMITH: They did not have this on the shelf. I know that for sure. But since then, they have been able to make viruses that fight viruses or bacteria that fight viruses. And so it was a good thing that came out of it, even though it was a horrific, horrific accident that happened in there. And that is now being employed in other civilian use places, I believe. And it's coming out really slowly because they're doing a lot of data on it. And I think that's a positive thing. I just know that through the part of the hybrid things I was involved with they were changing DNA with viruses. And it was the easiest way to mix a protein with a protein where it's accepted. So the whole body would change. And then they would take those cells and grow it or inoculate another being. And that's what they kept doing is inoculating beings over and over and over with these different types of viruses. And then you have this super being.

DAVID : So we could have, for example, people starting to have super visions, super hearing, psychic abilities perhaps, all from these types of inoculation.

SMITH: That's correct.

DAVID : Well, that's very fascinating. Well, Emery, I want to thank you for coming forward. This is very fascinating. Very bizarre--

SMITH: Very bizarre.

DAVID : Information. But sometimes the fact that it's so bizarre makes me more inclined to believe that it's true. Because who would have ever invented or thought of something like this?

SMITH: It's definitely a hard nut to crack.

DAVID : Yeah, that's for sure. I want to thank you for watching. This is "Cosmic Disclosure" with our special guest, Emery Smith.

Aliens at Home on Earth Season 11, Episode 12

Cosmic Disclosure; Aliens at Home on Earth Season 11, Episode 12

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. I'm here with Emery Smith and Corey Goode, and we're talking about ETs living among us. Emery, Welcome to the show.

EMERY SMITH: Thank you, Dave.

DAVID: And Corey, welcome back.

COREY GOODE: Thank you.

DAVID: So just to open this up, Emery, to your knowledge are there extraterrestrial beings that did not originate on Earth that would be able to pose as humans from Earth to a degree that we wouldn't notice that they were any different?

SMITH: 100% you would not know.

DAVID: OK.

SMITH: And they are here.

DAVID: And could you tell us a little more about that?

SMITH: Well, extraterrestrials also come to watch over us and look at things on the Earth. And they're here to gather information to make sure we don't blow up the Earth or kill each other. So they're here just to get information and have it and to also experience the life of a human, which is quite preferably like a vacation for them. So it's a very interesting scientific job for an extraterrestrial to have. It's kind of an honor to come here, live amongst us, and do things, just living like a normal human being, actually, and interacting with human beings.

GOODE: Like the Peace Corps.

SMITH: Right, just like the--it's like a universal Peace Corps.

DAVID: Is there any--either of you guys can take this. Is there any regulation on this? Is this an illegal immigration program? Or is it sort of something where they just show up and we don't know about it?

GOODE: It's both. It's both. Some of them are from other star systems far away that are paying very close attention to what's going on here, including the Draco conquest of star systems. So they'll send people in to do a little reconnaissance.

SMITH: Sure.

GOODE: And when they come in, and they come in without permission, if they get caught, it's not a good thing for them at all.

SMITH: No, right.

GOODE: There's actually a program that I was a part of called the Intruder Intercept and Interrogation Program. And we ran into quite a few different species that were here without permission.

DAVID: All right, well, I want to ask another question that might seem dumb, but I think we could get somewhere with it. When we went back to the original Disclosure Project event, 2001--and you worked with Dr. Greer for many years.

SMITH: Absolutely, yes.

DAVID: You had access to those insiders, obviously.

SMITH: Yes.

DAVID: In the Disclosure Project 2001 event at the National Press Club in Washington, DC, you had Sergeant Clifford Stone, who goes up there and says that there was this group of 57 different ETs that he had on a checklist that they called the Heinz 57. And he said that many of them looked almost exactly or exactly like us. He had a theory that I guess was the common theory at the time that maybe some primordial human race had just gone around and seeded itself all over the galaxy. Do you think that's why there are people on other planets that look like us? What do you think might be the explanation for this?

SMITH: Well, the explanation for that would be they have--the Earth itself has been here a very long time. And people are--it's hard for them to grab that concept that it's been here for billions of years. And what has happened is during that time, Earth had many visitors and made different types of extraterrestrials that had lived--

GOODE: Refugees. Lots of refugees.

SMITH: Right, lots of refugees that come here seeking a safe place to make another civilization.

DAVID: Right.

SMITH: So these civilizations colonized Earth. And with that, there was other extraterrestrials that came here and experimented with this human DNA and made hybrids. And they also made many other creatures that you find here on the planet. If you look at everything, it's a very intricate design, from a grasshopper to a blade of grass. There's a lot going on.

GOODE: Yeah, and also with intelligent design, usually when these genetic farmers come here, they have to have a base species to begin to engineer. And from what I'm told, the sun and our planet puts off a certain frequency that determines what type of life form we will be, five fingers, mammalian, and have a certain form. So there's also that aspect to the development of species. And then they come in and then they begin to use various genome to change the race.

SMITH: Right.

DAVID: One of the things that this insider Jacob told me--and he's the guy who has claimed to be in the Secret Space Program and visited over 2,000 off-planet locations and had information it correlated perfectly with what you said, Corey, when you showed up. He said that Earth has a much higher complexity of a genetic wave that supports far more diversity of life on this planet than would normally be able to happen on other planets. So a lot of ETs have wanted to come here, because you can basically drop off any life form you want, and it will be able to live here, whereas that might not normally happen. Have either of you heard of something like that?

SMITH: I wouldn't say any form, but yes, I would say that does happen. And I would say that a lot of the new species that people are finding every day--people are finding new types of insects and new types of creatures on the bottom of the ocean. So these discoveries are every day if you look it up. Every day there's something discovered, especially in the Amazon and whatnot, with plant life and small animals. So, where are those coming from? And why haven't we seen those in so long? We've been here a few thousand years, so you know. So what's going on? And this is what's going on--we're being seeded still to this day, and genetic mutation is still happening to this day with all of us and the animals and the oceans. So it's evolving here as well, so don't take mutation as a bad thing. Some mutations are good, because it keeps us alive.

GOODE: What was interesting is in the Intruder Intercept and Interrogation program, only about 10% to 15% of the beings that we processed were what we would call alien-looking. Most of them were very human-looking. And they weren't augmented to look human. They were humans, just from a different planet. And they would normally be picked up in countries where they would most likely blend in. Like there were some Polynesian-looking ones.

SMITH: Right. The Nordics and all this. Right.

DAVID: It definitely has to be asked--if there is some kind of regulation of this, it's clearly not the United Nations. It's clearly not elected officials. How is this governed? And who is in charge?

GOODE: Most of the information from this program is very disturbing. And I have not shared it. But an interesting thing is that if any type of a certain category of insectoid being or any type of reptilian being was recovered in this program, they were turned over to the Draco. And some of them were not friendly at all to the Draco.

DAVID: So how would somebody who has such a diverse biological makeup be able to walk around on Earth? Like what's going on there?

GOODE: Like I said, many of them look like us. Others are able to augment their appearance. They're so highly intelligent that they're able to blend in with no problem. And you were saying that they had jobs. And I was there when it was a high-level executive was pulled out of a high-rise building in the middle of the day. They delta-waved everyone there, went in, and ingressed, egressed from the roof, took him out, and brought him up for interrogation. And he had been on the Earth for well over a decade and had blended in, had created an identity, and was now at a high position in a corporation.

DAVID: Wow.

SMITH: Yeah, they prepare these extraterrestrials to come to this planet, so there is some genetic inoculations going on, like what we do here as far as frequency goes, how they survive here. And even as far as getting certain procedures done on their body so they can digest our food and things like this. So there is a big augmentation for the extraterrestrial.

GOODE: And acclimation.

SMITH: And acclimation.

GOODE: When they were tracing back in the program, a lot of these beings, their origin of when they got here--because they're able to trace it back technologically. It's very interesting. They found out that their first point of contact on this planet was an abductee, an abductee that knew what they were doing. They were taking this extraterrestrial in, teaching them how to--all about taxes, all about the things from our society to help them integrate.

DAVID: So you're saying that an ET group that looks human would scoop somebody

up at night out of their home, let's say, and then bring them up to the ship and interview them about Earth culture and then learn from that?

GOODE: No. I'm saying that these abductees may find--their friends and family may find them out of the blue having a new roommate that they are teaching how to acclimate into our society.

DAVID: That's very interesting. So the abductee is aware that this person is not a regular person?

GOODE: Absolutely.

DAVID: How do they ensure silence?

GOODE: Well, these people are dedicated to helping this race. They've got a whole mission statement. They're helping humanity or, you know, for whatever reason. But they're unapologetic when they've been interviewed.

DAVID: So, Corey, you were starting to answer the question of how is this governed, who's in charge. And who is responsible for making the call as to whether someone is a legal or an illegal immigrant? 234

GOODE: Ultimately it's a corporate decision. The Interplanetary Corporate Conglomerate heads up that initiative.

DAVID: And that's a division of the Secret Space Program?

GOODE: That is. And they report, obviously, to the Draco. Yeah, there were times when we would get in a reptilian-type being that they completely were freaked out at the prospect of being sent to the Reptilians.

DAVID: Oh, really?

GOODE: To the Draco. They were basically here scouting, looking for tactics and ways to infiltrate and defeat the Draco.

DAVID: Oh, wow.

GOODE: So that they're an enemy. And there were different types. There were some different insectoid types as well that they were immediately on the list to be handed over. And they would scream and protest about being sent.

DAVID: So we have talked about this on the show before, but in case someone hasn't been watching, how would an insectoid type be able to walk around on Earth undetected?

GOODE: A lot of the insectoids, and I reported on Mars there were two or three different security outposts that saw a being walking their way, and they were each describing them differently.

DAVID: Oh, really?

GOODE: And one of them saw a human in their group's gear, the proper gear. Another one saw just a different--they saw something differently. So these beings have this--and they assumed that it was part of their development as they were predators developing the ability to stun their prey with their minds or make their prey see things.

SMITH: It's a mind thing. That's right.

GOODE: Right. So what they do this they can affect the consciousness of thousands of people at one time. And some of them are technologically enhanced. And it causes us to see them, and if we were to touch them, our minds, what the mind perceives, the body believes. If our mind is telling us that we're touching human skin, that's what we're going to experience. So it's all in the mind.

SMITH: Right, yeah, absolutely. That is true.

DAVID: Were you familiar with that happening, that beings could throw an image over their selves when someone looked at them?

SMITH: Over thousands of people, even.

DAVID: Really?

SMITH: Yeah, so they have great mental magic, that they can make you believe anything and make you see anything. And that's very dangerous in a way. But luckily there's nothing that has gone too bad with that, that I'm aware of. But operating on these beings, which I've seen them, plus I've seen them outfitted with types of, you know, like you said, these other devices that are plugged directly into their body.

DAVID: Like a wet-wired socket that's in their body?

GOODE: Some.

SMITH: Yes. Yeah.

GOODE: Some just touching it to their skin interacted with their neurology. There was no type of surgical implant. Like the one that I talked about, it strangely enough, it was an insectoid. It had segmented arms, you know, like an insect that made its

biceps and triceps, its segments like this. And on the bicep part of the segment was a bracelet. And they had a difficult time capturing these beings because they were able to touch this bracelet or activate this bracelet, and they would--bzzz--vibrate so fast that you couldn't see them.

SMITH: They're invisible.

GOODE: Right. And I think it was a Marine or one of the security guys took it and put it on his bicep, and he turned it on, and it shook him to death violently.

DAVID: Oh, wow.

SMITH: Couldn't handle it.

DAVID: Did you ever see any type of hardware that the beings' bodies were wearing when they got brought in on these gurneys?

SMITH: Oh, yes, many of them. Some had like very skin-tight suits on that were made up of billions of spheres, micro nano spheres. We later learned that was--we reverse-engineered that into the special predator suits that reflect whatever's behind you, in front of you. So it's the ultimate camouflage. And that was all reverse-engineered from--even insectoids came in with partially clothed or whatnot. I get that question a lot. Do ETs or do aliens, which is inappropriate, wear clothing? And yes, they do, but it's very rare, and it's more--

GOODE: A tool.

SMITH: --functional. It's a tool. We said it at the same time. And they use it. And they use it for many different things. Like these bracelets, I've seen these things on beings that come in. And some of them actually come in--they don't like strip it down. The ET, when I get it, it could have things on it already and it just came to me first.

DAVID: But you're not allowed to do anything you're not authorized to, right? So you couldn't even touch it or--

SMITH: Oh, no, if I'm seeing it, it means that we're doing something. I have something to do with this extraterrestrial.

DAVID: But you couldn't touch the bracelet, let's say.

SMITH: No, I wouldn't touch--oh, gosh, no. I would never touch anything, you know--

GOODE: Because it's dangerous.

SMITH: It's like I do underwater photography, and I'll film these guys all day long, swimming, grabbing these great whites and these hammerheads and taking a little ride, but I'm not interacting with them, because I'm not--I don't know them well enough. And when you see an extraterrestrial there with a bunch of gear on it, and you just need to do a skin scraping, you're not going to--you don't want to mess with that, because so many people have died in the projects because curiosity killed the cat. And I've seen hundreds of videos of technicians--and they show us when things go bad. Everything is recorded. So I've seen a lot of deaths on video they show us, like make sure this doesn't happen to you. And that's these things where they try to take a piece of jewelry off they think or to get to a spot, or they move the body in certain positions also that somehow activates something.

GOODE: Or they'll release a gas or--

SMITH: Oh, my goodness. Right. And that's why now we're in spacesuits, of course, on all this stuff, because you never know, especially if you've never had that species before what could happen. And there's many accidents that happen that you don't hear about.

GOODE: There are some chemicals that are in these beings that interact with air and moisture that will catch on fire or explode.

SMITH: Yes.

DAVID: Well, you mentioned the predator suit. And this is a question I'm sure we would get in the comment section if I don't ask it. Would there be--are there certain situations like what happened in the movie "Predator" where a being comes here and basically just wants to kill a bunch of people until somebody catches it?

SMITH: I'm not aware of that. Maybe you are, Corey. I've never--

GOODE: No. No, they come in with a very small footprint and want to be undetected. This area is policed too much for that kind of thing.

DAVID: Well, so we can safely dispense with a lot of the fear porn that people might try to concoct if they don't have this question answered by you guys, because people are going to think that there's beings that are just going around and biting people's heads off and doing all kinds of crazy, nasty stuff.

SMITH: No, no, those are called humans. [LAUGHS]

SMITH: It happened in Miami.

GOODE: Yeah, the biggest monsters on this planet are human. But no, a lot of these

beings, they're just here to study us and to get intel.

DAVID: Right.

GOODE: And are doing research.

DAVID: And it sounds actually like what you were saying before, Corey, that if one of these beings gets captured when it's here on an unapproved mission, that's a lot worse than if it wasn't captured because of what happens when it goes to the Draco.

GOODE: Well, yeah, and also, the scope of this program, the Intercept Interrogation program, is they also monitor like "Men in Black," monitor ETs that are here with permission that are integrated into our society. They also manage them to keep them apart if there are groups that don't get along well. Or if they happen to mix and not get along, then this group goes down and they basically behave as police.

DAVID: Well, we've talked about this before, Corey, but I also think it's important to reiterate. And I know you don't have really specific data, but do we have any sense as to how many approved immigrants there are on this planet that are not from here that are blending in our society?

GOODE: It was--back in the '90s, it was many, many tens of--451 I mean, many thousands.

SMITH: 100,000 was the numbers I'm recently getting in the past six months.

GOODE: And it was probably a smaller number when I was in. And it was in just about every country. It's well known that they were integrated.

DAVID: Well, if you said 100,000 is a number you got in a briefing recently, and then Corey, you said that the genetic type determines where they go, these would be maybe fairly evenly distributed throughout the planet? Or would they go to more of the developed countries instead?

GOODE: It depends on their mission, like some of them are here as like the Peace Corps. So some of them are here to spend time amongst the poorest of us, to learn about our development.

SMITH: They're listening to the stories.

GOODE: And how they can guide it.

SMITH: Yeah, they're listening to the people's stories. And they're recording all this information from country to country into a huge database. And they're trying to figure

out what went wrong or where are we going or--

GOODE: Our sociology.

SMITH: Right. They're trying to help us.

GOODE: How we think.

SMITH: But by doing that and getting someone to live with someone in Zimbabwe and someone in Poland and someone in Russia and someone in America and all of these agents are recording all this stuff and finding and reading the emotion behind it and seeing how--who's responsible for that. And they're going up the chain, too. It's not just the regular farmers and people out in the woods. It's actually now becoming pretty popular to have this extraterrestrial exchange student and this training and stuff.

DAVID: So if the Draco are ultimately regulating the immigration, and they are, of course, diabolical, chaotic, evil, then how would somebody get a benevolent plan approved if they're going up against this very--

GOODE: It's more of an understanding. It's more of an understanding that if we have a certain group that presents itself, certain types of beings that we will, because of this alliance we have with the Draco, that we will pass these prisoners on. I'm sure we have some sort of similar agreement with them that if they run across a certain type of situation, information gets passed off. It's kind of how they do these treaties.

DAVID: So maybe there are universal laws where the Draco have to allow some of this to happen as long as it's done through approved channels.

GOODE: Possibly, but the Draco do not control everything. They just control a certain percentage.

DAVID: I see. So one of the things that we had is a viewer question that we want to throw in here is regarding abductions. Now, Emery, you talked before about PLFs. So, just to set this up, could you again remind us what you knew about PLFs. What do they look like? What does that mean? What is a PLF?

SMITH: Well, Program Life Form is a bioengineered, cybernetic organism. And what it does is they grow these and they outfit them for many different missions. So one of the ones I saw looked like Felix the Cat.

DAVID: Really?

SMITH: Yeah, it was about three and a half, four feet. It was very agile. It came to one of our rental homes during a CE5 expedition at night. And it scared one of our

master team leaders in the bedroom. And I was running a lot of security back then. And I was in that house with the core team. And I ran--I just jumped out of the bed in my underwear and ran out, out the door with my gun. And sure enough, it was trying to get into the window of the home. And it just stood up and walked 10 feet. And there was a three-foot brick--uh, stone wall. And after that it's like a cliff, just with jagged rocks going down at like a 45-degree or less angle. And I was just so amazed and intrigued by its beautiful eyes and ears. And the way it was moving was so fluid. And it just emanated this like most horrible energy that makes you gut-wrenchingly sick to your stomach. But I was still able to stand. It was more like a sea-sick feeling, like just, ugh, automatically I just wanted to vomit. So it just--

DAVID: Well, now wait a minute. When you say it looked like Felix the Cat, are we saying like comically obviously looking like Felix the Cat?

SMITH: Comically, think of a rubber latex Felix the Cat standing about four feet tall.

DAVID: Oh, my god.

SMITH: And double-jointed in the kneecaps, by the way. And I had a very bright light, and I was shining it down and holding my gun, looking at it, and it just basically hopped from rock to rock so quickly and went away. And it was there for surveillance. And whoever was remote-controlling that, because that afternoon at noon when I looked up on the cliff about 100 stories up were two black SUVs and six suits. They didn't know I seen them. I was working out in the back yard and went under this rock though this canyon and looked up at them. And I totally got a great look at them. So they were already planning it out to get in this house. We also found very odd footprints on the outside table and spa that went up to the roof. So this being was already been around the house a few times at 3:30, 4 o'clock AM surveiling. So these creatures might be used for surveillance. They might be used for a one-way mission. They're also put on a spacecraft to go to different places to gather information and hopefully come back.

GOODE: They weaponize them also.

SMITH: Right. They're amazing weapons. And they also--

GOODE: Explosives and--

SMITH: --make them so they can only swim in the water maybe. Or, you know, so it's very--the way they design these--maybe its going to be in the arctic. So you need an arctic one. You need a tropical one. You need all these different types of environments it's going to. It's geared for that environment to that specific mission. So it's not a conscious being. This is a remote-controlled, half organic, mostly cybernetic organism that they have perfected in the MIL labs.

DAVID: So, this viewer is thinking that if there is an authentic abduction that you're going to have organ harvesting and fetuses implanted in the body.

SMITH: From a real extraterrestrial?

DAVID: Right.

SMITH: Well, I'm telling you, these beings that have traveled billions of light years--and that means they have something other than gas, coal, and oil powering their little ship. They mastered zero point energy, free energy and time and space and all this--all these physics that we are dying to have this technology. That means they can pretty much make anything they want--anything they want. So they don't need--

GOODE: Their technology is consciousness and vibration. They understand the co-creative consciousness and everything is vibration and how to manipulate matter on a level that we just don't understand.

SMITH: Exactly. So they can make gold. They can make a sperm with my DNA in it. They can make pretty much anything they want. So they don't need anyone's eggs or sperm or fetuses or implantation. There's no need for this. They're at a very high level of consciousness. And someday we'll be there. The movies and everything has manipulated us to--and a lot of abductees have this implanted in their head or whatnot, and they really believe this. And these things may have happened through a non-authentic abduction.

GOODE: Yeah, and there's also the aspect that, like I said, most of the abductions, they are re-abductions. People that are a part of these genetic programs where they're having fetuses implanted and these types of things, when they are returned, they are re-abducted by the military, who then go in, do some tests, try to figure out what's going on, then give the person a screen memory with our technology, which is why a lot of these abductees have a hard time, because our method is very messy. The ET method is elegant and precise. So they create further problems for abductees by re-abducting them, debriefing them, examining them again, further traumatizing them, and then using a subpar method of removing the memory or giving them a screen memory.

SMITH: They have reoccurring nightmares, and these things keep going on. It's not helping them for what they're doing at all. But this is just the way it is right now.

DAVID: All right, I want to ask one last question on this subject, which is kind of dumb, but I think it's important. What's the endgame? Why would a group that has colonized our solar system and has interaction with all these ETs want us to think that ETs are evil and traumatizing us and doing these horrifying abductions?

SMITH: So when they do come and we do kill them with our military, that we have the support of the people. We have to have the support of the people to move forward and kill these horrible, nasty creatures that are coming here to take over the planet. So that's why. And why do that? Because if you do prove ETs exist, the first thing Harvard and Stanford physics guys are gonna ask, well, how the heck did they get here? They didn't use gas, coal, and oil. Oh, well, there's this other thing we didn't talk to you about that's been out there since 1899.

GOODE: Which is--

SMITH: The Tesla and Stubblefield know.

GOODE: Yeah, the greatest classification in the land is not that there are ETs. It's how they got here.

SMITH: Right, exactly, because that solves everything. And so it's gas, coal, and oil. If you prove they exist, then we gotta get rid of gas, coal, and oil, because we don't need them anymore.

DAVID: All right. Emery, we had a question in the comments from one of the episodes that was just you and me regarding benevolent abductions, your understanding of that. Because it appeared in the comments, some people thought that you were saying that all abductions were PLFs, that there's nothing going on that's positive.

SMITH: No. Right, no, of course not. That definitely happens, where these abductions come and maybe to help somebody out or maybe to educate someone on something. And there's also these other close encounters, where people are actually going to the craft or walking up to the ET to meet them in a very nonchalant way and not showing fear and showing a more welcome attitude and a high consciousness, which is happening all over now. And people are contacting extraterrestrials. So people are wanting this. And the abductees, I think what has happened from my experience of listening to these people is it's always been a very positive outcome of whatever it was. And I notice a lot of these people were going through very hard times of their life or they were injured or they had a very bad disease. And they were taken aboard this ship without knowing, but it turned out to be a really beautiful thing for them.

DAVID: It sounds to me like if this military-industrial complex space program is creating this fear of negative ETs that that's the same as how every other conquering race has demonized indigenous people and said they're savages, they're blood drinkers, they're dangerous, we've got to wipe them out. So they're just doing the same thing, except now instead of it being continents and oceans, it's planets between planets.

SMITH: Correct. We are kind of just divide and conquer. The human race just goes places, and the more intelligent human on the planet teaching the savages to study this religion and do this or you're going to die type of thing, which we've done in the past is now the opposite. We're the dumb ones, they're thinking, and they're too smart for us, so they're going to do what we did.

GOODE: Right.

SMITH: And the thing is, they're not like that.

GOODE: Columbus all over again.

SMITH: So don't think like a human is what I'm trying to get at.

DAVID: So I want to dumb it down a little bit here. And I want to talk about the abduction phenomenon that most people in conventional ufology are aware of. And just to set this up--

SMITH: So PLFs are used for that. I know there's a lot of comments online. And people are like, well, he doesn't believe in real--well, no, there are. I'm not saying it's all just those abductions, PLFs.

GOODE: And these are usually the human abductions that come after the alien abductions. And they use PLFs and puppets. They use puppets, too, and they drug the people.

SMITH: Right, and they drug the people.

DAVID: So what people are seeing as Greys, is that a PLF in a lot of cases?

SMITH: I'm saying that probably 90% of a lot of these abductions are, you know, man-made, human-made. And others are real and are possibly real. And I think that people out there need to understand that it's just through my experience and through my briefings and knowing people who have been on these projects that this is how they do it. And they definitely mind-wash you and they brainwash you and they put these--after they, like Corey just said, they'll come up to the house, gas the house, and at the same time, there will be a puppet outside the window. And then the next thing you know, you're knocked out, and you wake up in an operating room. And you're groggy, and they gave you medications that make you kind of forget, not forget.

GOODE: Yeah, any anesthesia is--

SMITH: Why is everyone can't be really specific about it? Because everyone's always a little, you know--not everyone, but most people. And it's because you're drugged.

And they want you just to see a couple things. They want you see a big Grey or a little Grey running around, poking you in the butt or whatever. And what happens is, you wake up in your bed the next day or on the side of the road, and you were abducted. And they were abducted. Now, who abducted them is the question. And it was a real abduction, and you did have something done to you. But was it extraterrestrial is the question.

GOODE: Yeah, and another thing is these Grey-looking PLFs are standard hardware for many different ET groups. So many times, the ETs, when they do abduct, they'll be in the next room, and it could be an insectoid, it could be any type, including a human. But they all use the same type of PLF, and it is in there doing the hands-on work of doing whatever procedures are. And it's not only so that we don't know who they are, but it's also kind of like wearing a spacesuit. They don't have to worry about getting any type of viruses or anything else from the subject.

SMITH: Right, that's why they're so good, the PLFs.

DAVID: OK, we are out of time. But I wanted to end this on a positive note, because we're getting into some disturbing material here. So I want to give both you guys a chance to do a little 30-second elevator speech on this. Do you think that what we're doing with this show to promote disclosure will stop the abductions? And if so, why?

GOODE: Yes, disclosure is going to stop a lot of the human abductions--the human-led abductions. Most of these human-led abductions are really rehabs or re-abductions. They're trying to figure out and catalog, follow what the ETs are doing with us when they pick us up in abductions. I recently reported that this genetic experiment is pretty much coming, not to an end, but humanity is going to take over their own management of this genetic program. So yes, we are about to go through a very empowered period to where we're going to be in control of our own genetic and spiritual determination. And there's not going to be a need for all of these beings to come down and abduct us.

DAVID: Right. Emery, what about your thoughts on this?

SMITH: Yeah, I agree with that. And I also think that once disclosure does happen, that also opens the doors for extraterrestrials to come here safely. So there is going to be a huge meeting of many different races of extraterrestrials in the Galactic Federation. And what's going to happen is once these extraterrestrials actually do show themselves and everyone will be able to lower their shields down because you'll notice, well, my goodness, talking to you, you're not so bad after all. So these things all have to be factored in as us opening our arms to these people to actually bring cool technology also to us and to help us. And they will also help us find out who has been doing the abductions. And they will help protect us from the other ones that are doing

the abductions. So there's this really joint venture out there right now, and they're just waiting for us to get our heads screwed on right. So I think it's going to be a good thing, and I think people will have open arms. I know I will. And it will be a big transition, like Corey said, and there will be a lot of education immediately put out on phones and computers and e-mails. And it'll be instantaneous. It'll be very quick.

DAVID: All right, well, this is really fascinating. Thank you, Emery. Thank you, Corey. And thank you for watching. This is "Cosmic Disclosure."

ET Detention & Interrogation Season 11 Episo 13

Cosmic Disclosure; ET Detention & Interrogation Season 11, Episode 13

DAVID WILCOCK: All right. Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. We're here with Emery Smith and Corey Goode. And in this episode, we're going to be talking about extraterrestrial detention facilities. Emery, welcome back.

EMERY SMITH: Oh, thanks. Excited to be here.

DAVID: And Corey, thanks for being here.

COREY GOODE: Thank you.

DAVID: We have talked in the past about this intercept and interrogate program that you were involved in, Corey. So in case someone isn't aware of what that is, could you please summarize that for us briefly now?

GOODE: Yeah. It's a program that, in part, is similar to "Men in Black." What this intercept and interrogation program does is that if an intruder flies into our system, doesn't give a friend or foe signal, and is intercepted, they are taken from their ship. Or what happens in most cases is that ETs have made it to the Earth and are here secretly blending in as one of us. And this group will go in and retrieve the people that are here--we call the ETs people--the people that are here without permission, bring them up to a certain station, and their interrogations would begin to find out what was going on. This group also operated as a police force for the nonterrestrial groups that were here with permission. They helped keep them apart. And when they had issues, they acted like police.

DAVID: Now, the program you were in, Corey, is called Solar Warden. A warden would be like somebody working in a prison or jail. Is there any relationship with that name?

GOODE: Yes. The mandate of Solar Warden was to police our solar system. That was the main mandate. They had also a program to establish bases on the closest stars in our local star cluster. But yeah. That's--that was their mandate.

DAVID: Emery, you claim to have autopsied over 3,000 different biological specimens.

SMITH: Correct--specimens.

DAVID: Did you see any that looked enough like humans that they could be here on Earth in that program?

SMITH: They look just like us. They smell like us. They walk like us. They're just, their IQ is higher. They're a lot more conscious than we are. And they can easily fit into any place on the planet, regardless of language or religion or, you know, the finances of that country, we'll say. So they don't have to have a lot of money to survive here. They can live like a poor person, or they could live like a rich person, or just a regular person.

DAVID: You've been involved in a variety of different black ops programs. The one that you and I talked about the most over the last 10 years was these autopsies.

SMITH: Yes.

DAVID: Did you get into other programs later on where you were aware that certain of these human ETs were here on Earth?

SMITH: Yes. And what had happened was some of the extraterrestrials that we were working on in the lab and doing dissections and whatnot, some of these full-bodied humans, extraterrestrials would come in, and they would be very badly beaten, where subdermal hematomas from being hit in the back of their head, looks like they were tortured, sometimes many broken bones. And we don't--I didn't find out till later on that these beings were actually coming from a prison or a withholding cell of some sort and were being interrogated. And this is probably what, you know--after that, they would probably come and send them, because they're just a corpse at that time. So I'm just assuming, after hearing your testimony, this is what we were receiving, because usually, they're in pretty good shape unless they were, you know, shot down or something. And these were obviously been beaten to death.

DAVID: Hm.

GOODE: Yeah. We can mention this a little bit later. But you know, I also received--when I was on the research vessel, I received specimens that we passed on. I can talk about how we did that, if it relates. A lot of times, the individuals that were being interrogated just died of stress and trauma from the process. It was very disturbing. But they were tagged and sent for study afterwards.

SMITH: Right. We had a few come in that they actually starved to death. So I'm not sure what happened, but they were definitely--they starved to death.

GOODE: You know, well, there's prisons that they have for them, some of them where they bring them, like a conventional prison. That's where they need to further interrogate them for a while, get more information, or have them to trade off or to

pass off.

SMITH: Right.

GOODE: Fairly recently, I was given a extensive, I guess, viewing and tour of the Lunar Operation Command. And it connected to two other commands--the Lunar Operation Command they call LOC Alpha, and below ground, in these lava tubes, are two more, called LOC Bravo and Charlie. And LOC Charlie has a research facility that's cryogenics. And one of the floors of that is a storage facility for some of these beings that they put into stasis.

SMITH: Right. There is a huge one of those where I worked, I'll say a large cryo morgue, where these are kept, you know, in the hundreds, before they go into the lab. There's always enough bodies and there's always enough specimens. It's like an unlimited amount. It's like they can't keep up with it. There's just so many going on--you know, hundreds of these rooms that I've worked in there that people are working on. One of the things that happened one time, we did get a bunch of bodies. And they were completely ripped apart and burned. And they stopped doing this. They were using the military with giant C-130s and Hercules to transport bodies to different labs around the world. And one crashed. And then they stopped doing it, because civilians arrived on the scene and saw all these different creatures and different--

GOODE: Do you recall when and where?

SMITH: That was in 1994. Yeah.

GOODE: Hm.

SMITH: And this year--

DAVID: And where was it?

SMITH: I don't know where it was. I have no idea. I just know the whole background story because we were actually briefed on it, and because the tissue changes when it burns. So you have to be really careful not to take that tissue.

DAVID: Do you know what they did with the witnesses once those people saw this? Were they terminated? Or--

SMITH: Yeah, I heard the witnesses were threatened. And I know there was one witness that was terminated on site.

DAVID: Because they just couldn't handle it? They were going to talk? Or--

SMITH: I think--

GOODE: Or they saw one thing they weren't supposed to.

SMITH: Yeah, I think it was more of that. And they were snooping around and actually taking things from the site.

DAVID: Oh, wow.

SMITH: I mean, from the crash site. Yeah.

DAVID: So what do they use instead of a C-130 now?

SMITH: Oh, everything's done underground. Everything is through the maglev tube system or other systems that they have for transport down there.

DAVID: Hm. Could you describe what this cryo storage facility would look like, this cryo morgue?

SMITH: Oh yeah, sure. I've seen it many times. It's basically--I'm trying to think of a movie, maybe, that could relate to that. Well, think of that "Matrix" scene, you know, all those bodies sitting in there, but these are all up and down. OK? And most of them are up and down, but some of them are at like a 45. And if you walk into this area, it's about five stories high, OK? It's below freezing in there. And each one of these containers are a different size. They're not always all the same size because of the different specimens. We have vacuum-sealed containers that are just this big for very small pieces of tissue. The smallest one is about 12 inches by 6 inches long. It has a keypad on it. And it's made out of glass and a special metal. And it's vacuumed. So it has its own vacuum-suction pressure system. And it also has a gas system, because some of these samples have to be stored in different types of gases to keep the tissue, not always just ice and--

GOODE: I hate to interrupt.

SMITH: Sure.

GOODE: But on the research vessel, when they would bring in specimens, they would rebag them. And they would arrive in like--especially the smaller samples--would arrive in a small kind of metal box that had what looked like glass across the top.

SMITH: Yeah.

GOODE: And the specimens looked almost freeze dried, but they weren't. They were

in stasis. This is how the ETs shipped it to us. They then--the technicians then took it in, turned off the device in a certain way, unsealed it. It was vacuumed, and they removed it. And then they put them into another vacuum-packed metal box that was then put into a bag, like a hazardous materials-type bag, that was sealed at the top.

SMITH: Yeah, no. That's very accurate. I've seen the square metal cases before.

GOODE: When you looked at the specimen, it looked like it was freeze dried. But when they would turn it off, it would go back to looking wet.

SMITH: That's right. Yeah.

DAVID: Hm. So we've been talking about your Intercept Interrogate Program. And this is obviously a whole world that none of us have been privy to. What kinds of prisons do they have, if these beings interlope and get into our solar system? How do they deal with that?

GOODE: What happens in an interrogation? If they're cooperative, if they say, I'm here, I've got a small support team that's cloaked outside of Jupiter, or you know, just for example, please contact them, verify--and in many cases, we would hand them back over to their support group, say--give them a slap on the hand and say, this is the process that you come in legally, I guess you would say. Now, the ones that they wanted to further question, they would keep in prisons, out of stasis, you know, just like a normal prison. And some of these prisons were ships. Some of these prisons were actually some of the asteroids that we had mined. And then we ended up going in and creating partial cryo prisons, and but mostly, just regular-type prison. So there's a number of ways they keep these beings locked down.

DAVID: So what percentage of these violations would lead to sort of a friendly warning, as opposed to actual incarceration?

GOODE: That's--you know, that's really hard to say. I really didn't find out what happened to them after a certain point. You know, that information was compartmentalized. But the discussions that we had when we're off duty was that, you know, this is what happened to them. So I really don't have any numbers on what percentages, who was ferreted where.

DAVID: Hm. Emery, when you were in these programs, did you ever meet what appeared to be a biological extraterrestrial?

SMITH: Yes.

DAVID: Could you describe whether--like, did you ever get to talk to them? Did you ever get to find out if they were here on an approved basis, what they were doing

here, that kind of thing?

SMITH: Yeah. They were working in conjunction with--some extraterrestrials actually volunteered--either they were captured, then volunteered to work here and help us, or some were actually came here on their own will and had some sort of authorization to be in these labs to work with the physicians on many different biological aspects of tissue regeneration and hybridization and cloning.

GOODE: Yeah, that's right. They did force a lot of them into scientific positions.

SMITH: Yeah. It was either die, or you can work here.

GOODE: Yeah.

SMITH: And they do treat them really well, as far as I heard. I've heard many stories. Even on my team, I know one of the physicians was an extraterrestrial human, and spoke and smelled just like us. It was not, like, any different.

GOODE: After they eat our foods for a while.

SMITH: Right.

GOODE: If they don't eat our food, they smell completely different.

SMITH: Correct. Right. And we also had other types of extraterrestrials that were there, that later on, through my experience, I saw in meetings and stuff. But they were not part of my project.

GOODE: When you interacted with them, were there any type of weird social weird things?

SMITH: Yes.

GOODE: Can you describe some of them?

SMITH: Yeah. You know, they're very careful what they say, because a lot of them are still, like, learning our little idiosyncrasies, I'll say.

GOODE: Yeah, the English especially.

SMITH: It's just--it doesn't come out always perfect. And a lot of--you can see they're really trying to pronunciate the words, kind of like when people come over from other countries to the US and they only know maybe 60%, 70% of the language. And you know, they say it, but it has, like, maybe a harsh accent or something like that. And a lot of them, I think, actually, they have emotions like we do, too. And they laugh, and

they can be sad, and you can hurt their feelings, because they really, over time, the majority of them--not all of them. Some go rogue and try to escape. But the majority of them, actually, I think, after being with us, I think they feel sorry for us. And they want to help. And they want to stay. I really think they're that--they're so compassionate. They're like us times 10 in compassion. And you know, I've seen so much selflessness from a lot of these beings, especially when things get a little--sometimes things go wrong in the labs and stuff. And they--you know, they're there. They're not being shady, is what I'm saying. They actually care. Yeah. It was really interesting.

DAVID: Did you see a sense of humor? Would they--

SMITH: Absolutely. Humor is a big thing, a big thing with them. And--

GOODE: They love our music, and--

SMITH: Yeah. They love the lights. They love our music. Anything to do with the senses is just, they really indulge in that.

GOODE: Some of them like gambling because of that adrenal--

SMITH: Right. So they also pick up on our bad habits as well, such as food, and like you said, gambling, and these exciting things that we can get tied up into. So they're not invincible, because they fall under our dimension as well. So I mean, they're here just like we are. But they're just very conscious and very--their IQs are through the roof. And if you get one that speaks really well, you know, you won't probably know it, that they're an ET. Right?

DAVID: Somebody is going to want me to ask this, so I'll do it now. Do either of you think that there are people in very visible public positions that are actually extraterrestrial humans?

GOODE: I was told back when I was in this program that they are very limited in how they can participate with society. They can--they have--everything has to be pre-approved. They can work in our companies and that kind of thing. But they can't hold places of power. I mean, that's for the ones that are coming here on whatever internship it is.

SMITH: Absolutely. They're not allowed to have any influential positions. I would know.

DAVID: Other than business.

SMITH: Telling you guys, I would know right now, for sure, if someone of great

power was an extraterrestrial. And they're not doing that to us. And maybe in the future they will. If they have to step in and save the planet and save us. But right now, there is nothing like that going on. And the corruption shows that around the world. And they do. They have specific rules, like Corey said, that they cannot do certain things here.

DAVID: We have 7 billion people on Earth that are Earth-born human. And Corey, you've described a colonization of our solar system that appears to be much more vast than just Earth's population. Could you speculate as to how many people are actually living in our solar system, if we use the expanded term "people?"

GOODE: It's millions.

DAVID: Well, there's billions just on Earth. But you think there's millions of other people living in our solar system?

GOODE: Well, there's millions of our own people living throughout the solar system.

DAVID: Right.

GOODE: When it comes to nonterrestrials that live, it's a large number. Yeah.

DAVID: Is it--is there some reason why Earth humanity gets to be in charge of who comes and goes out of our solar system, as opposed to other groups that are already colonizing here as well?

GOODE: Well, for a while, that's how it happened. These different genetic farmer groups were controlling who was coming in and out.

DAVID: Wow.

GOODE: Once we developed the interstellar travel abilities and the military in space that we have, we began to police our own solar system.

DAVID: Hm. And the other groups allowed us to do that? Or--

GOODE: Yeah. A lot of them didn't have a choice, because we had--we now had their technology, or greater, that we were receiving in these trades. We were trading, you know, people and genetic material off in this galactic slave trade. And it's a huge--there was a lot of commerce going on. So I mean, for a while, we had issues when we were developing these commerce pathways throughout the local 52 star clusters, because there were already well-established trade routes. And we were interfering with that. We had a big learning process. Now it's to a point to where--it used to be when we had to send a whole fleet to bring, you know, beings and bullets to a certain

outpost. Now, they use the types of ships I was in, the big cigar-shaped. They're completely automated. And they fly from star system to star system. And they kick off, you know, these containers and leave them floating. And then they shoot to the next star system to do the next delivery. And they have no worry that a different group's going to come along and take their belongings. It's now all--you know, everything's well established now.

DAVID: Corey, you had mentioned that there is some new information you have about aquatic beings in the Pacific. Could you explain that to us now?

GOODE: Yeah, there is some new information I have. But this information I had back when I was in the interrogation program. The Navy had accidentally discovered a ET base under the Pacific Ocean that they were unaware of and that was not approved. The other nonterrestrial groups they communicated with said, no, this is not approved. So they then, the Navy intelligence, then organized a training operation above this base, to where they were dropping depth charges and other deep penetrating weapons into the ocean, and pretty much destroyed this base. Now--and the people, as they were dropping these ordinance into the ocean, ships were flying out. They were seeing all this activity. There were ships leaving--like, evacuating. So weeks later, the program sent in some of their electromagnetic subs to go in and recon this base. And when they did, there were dozens of these beings that were still alive. And they ended up bringing them up for interrogation. And yeah. They were aquatics.

SMITH: Do you know what they looked like?

GOODE: Yeah.

SMITH: What did they look like?

GOODE: Well, these were actually pretty small. They had them in this one tall, vertical tank together. And then they were kind of like, using the fishhooks that they do on fishing trips, were reaching in, snagging them out very roughly, pulling them out, and bringing them and putting them in this other tank that had cabling hooked up to it and a metal band around, just stuck to the glass, it looked like with silicone or something. And these beings, they had a big kind of lobe in the front of their head that was obviously how they communicated. By the size of their jaws and all that, they could tell that they obviously did not communicate vocally like we do. They communicated through--

SMITH: Echolocation.

GOODE: Yeah, very similar to like, dolphins. So they figured out a way to communicate with them. We were not communicating with them. Aquatics are hard to communicate. Their base of reference is completely different than ours. But they were

stressing these beings out, applying, changing the temperature of the water, putting chemicals in the water, doing all types of things to stress out these beings when they were questioning them.

DAVID: Emery, how often did you see aquatic-type beings when you were working in the program with the autopsy?

SMITH: I've seen a couple hundred aquatic beings, and meaning--or samples that were aquatic or aquatic beings. And he's right. It's just a completely different type of a body and a different type of cellular biology. And you know, it's very different, just as we are different than a dolphin or a fish.

DAVID: Did they have more cartilage than bone, in the way that their skeleton was?

SMITH: Yeah, that's a great question. They did. A lot of them were not able to walk on land. Some were able to. Some had a bony structure. And a lot of them had these very cartilaginous type of bodies, where they didn't have--you know, what gave them shape was actually this matrix web of cartilage intertwined with like, amazing muscle mass and amazing muscle definition. One of the ones that I actually examined had the body of a human. It had these fins that ran down the sides of the outside of the body, and kind of a little bit of webbed hands and feet, and stood about 6 feet tall. I've seen very small ones, like he talks about. And size does not matter in the universe. I'll tell you that much.

GOODE: We've had ships that crashed that were this big.

SMITH: Right.

GOODE: And they were occupied.

SMITH: Yes. So beings can be very, very small. We would have to use these giant neurological microscopes sometimes, to operate on some of these and take samples, because you know, they were only like, 3 inches tall.

DAVID: Neurological microscope meaning that you had to interface with it with your mind?

SMITH: No. Alls it--no, I'm sorry. Neurological--just a standard microscope they use in neurosurgery, for brain surgery and stuff, so a magnification, you know? Comes with it's own chair and stuff, and you just sit there and make these very small movements. And it is a very dynamic thing. But--

DAVID: The Atacama humanoid you dissected in Sirius is only about 6 inches tall.

SMITH: 13 centimeters, right.

DAVID: So how was that comparing with some of the smallest ones that you saw?

SMITH: Well, the smallest one I've ever operated on was about 3 inches.

DAVID: Really?

SMITH: Yeah. Full body. Same thing--the head was three times--

DAVID: And it was adult?

SMITH: The head was, yeah, three times larger. You know, the heads are always--for some reason, they're always a little bit larger than ours. And that's probably for the brain or other things they have that's special. Like, you know, his aquatics had this giant thing on the front for echolocation and communication. And we see a lot of that. We see a lot of these giant bumps and whatnot. It's made of calcium. And they're in really odd shapes. And it's very similar to that of whales and dolphins, like you said, Corey.

DAVID: Corey, we have these various beings coming into our solar system. And some of them are approved. Some of them are not. You haven't really talked that much about the intercept interrogate program before. So could you explain for us some of the beings that you saw in that program? Give us an example.

GOODE: Most of them were human. They just looked human, and just various types of humans. About 10%, maybe 15%, were the types that you hear described, you know, as aliens--very strange-looking, evolved in a completely different environment. So you know, we had insectoids. We had different types of reptilian beings, which we immediately turned over to the Draco. The insectoids--there was a certain type of insectoid, certain group, that was always turned over. But you know, I described the one that had a weird seahorse-looking head and an insectoid segmented body. There are a number of different amphibians. Now, I've described before the cat being that I saw. And that was actually later on, when I was in--when I was serving on the research vessel. Some of these beings, there is a capture or kill order out on them, because they just want to gather intelligence. One of these beings was this feline-type being that had the ability to teleport anywhere it wanted. And it basically just had to think of where it wanted to go, change its vibration to the vibration of where it wanted to go, and it just was there. And it was a very highly evolved species that this military group wanted to get a hold of. So apparently, they set up some sort of--like in the movie "Jumper," some sort of an electrical grid that when it popped in to have a meeting with someone it was meeting with on a regular basis, they were able to catch it in this grid. And it basically electrocuted it to death. And we saw the body when it was being transported. And it was very tall. You know, it's hard to tell, the way they

were carrying it. It was sort of lavender-colored. And it had, like, net burn marks all over. The tip of its ear was burned almost all the way off. But the weird thing is that even the sociopathic people that were there, everyone was overcome with emotion. Everyone just started--tears started rolling. You felt so incredibly sad about this being. And there were people there that had no emotions, literally, that were crying.

DAVID: Did you ever see feline-looking humanoids? Does any of this ring a bell?

SMITH: Oh yeah, lots of feline, cat-looking-type beings.

DAVID: So that was common?

SMITH: It's a common thing. Like he said, they're highly intelligent. And some of them are transdimensional, so they have these various special abilities. And some of them, actually, like an electric eel, have, like, electricity in them somehow. They're always putting grounding plates on these things before we operate on them, to make sure that we don't have any static, or they don't have any electricity left.

GOODE: I know what you're talking about.

SMITH: You know I'm talking about? So it's--you know, I don't like working on those, because a lot of people, even though they had the grounding plates on them, they were electrocuted, some of the technicians and physicians. But other than that, yeah, they're very common. There's many different types of species from all over the universe. And I haven't--I don't know of any that were bad that I could recall, in the briefings, I mean, when we do get that sometimes. So that's a good sign, that they have super powers and they're not aggressive.

GOODE: Yeah. This particular being, I remember, was visiting a certain individual, giving them spiritual advice and knowledge. And the individual that it was visiting was killed in the capture as well.

SMITH: Interesting. Wow.

GOODE: They were getting information of a spiritual nature from this being that was appearing to him from time to time. And some of the technology they have is able to tell when something teleports in, you know?

SMITH: Right. Sure.

GOODE: I mean, it's like there's a disturbance in their grid that they're able to triangulate in on.

SMITH: Yeah.

DAVID: Well, we we've been talking about the prison system. That's a big part of this show. And so in the time we have left here, I'd like to ask this one last question. There's been a variety of sci-fi movies that may have been inspired by the Cabal, that seem to be talking about the idea of prisons where people are put into some kind of suspended animation. So we have a specific question from the audience, because we like to answer your questions. And it said, do you have any information about the US prison systems on Earth developing suspended animation detention technology? Are they actually doing that, to either of your knowledge?

SMITH: I'm aware of that, definitely. They do this. It's a cost-effective way of keeping people at bay that have done some things, bad things.

GOODE: I've heard of them doing this to certain special operators that have gone rogue that are just too dangerous to be released into civilization. But I haven't heard of any plans to do that on the general population prison system. Though I wouldn't doubt that plans are there.

SMITH: I doubt that. Yeah.

DAVID: Well, within the rule of law, I think the ethical objections would be so high, I don't think it could ever be approved by any legitimate elected government.

SMITH: Yeah. There are entire planets like that, that have these suspended animation holding cells, they call them. And not saying the planet is as big as Earth, but pretty big planets that are out there. I'm sure Corey knows about this. And that's where they keep them.

DAVID: I did hear from the space program insider, Jacob, that he described there were prison planets, that there were planets in which the main function of that planet was to imprison people and keep them from leaving.

GOODE: Sounds like what we're living on a little bit.

SMITH: Yeah. It's very similar.

DAVID: Well, Jacob had specifically said you would not want to ever get caught in one of these planets, that it's an incredibly miserable existence if you're in one of those situations.

SMITH: Well, the ones I'm talking about were suspended animation and cryo. So these beings are in a deep sleep for hundreds of thousands of years, and 1,000 years, 100 years, could be even longer, depending on what they did.

DAVID: Well, you guys have both done a great job here. It's a very enlightening

discussion. This is "Cosmic Disclosure" with Emery Smith, Corey Goode, and me, your host, David Wilcock. Thanks for watching.

The Deep State of NASA Season 11, Episode 14

Cosmic Disclosure; The Deep State of NASA Season 11, Episode 14

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock. And I'm here with Emery Smith and Corey Goode. And we have quite the power pack of insider information for you in this episode. Emery, welcome back to the show.

EMERY SMITH: Thanks, Dave.

DAVID: And Corey, thanks for being here.

COREY GOODE: Thank you.

DAVID: So Emery, one of the weird things that has come up on "Cosmic Disclosure" is this idea that there are two actually major different types of space program. And one of them basically has no idea that the other one exists. So Corey, could you set this up for us? Because I'm really interested to hear what he's going to say about this.

GOODE: Sure, what we're referring to as the Military Industrial Complex Secret Space program, you're probably going to be very familiar with. It is the Air Force and the DIA mainly that control it. And it comprises of mainly a couple of space stations that are about 50 or more years--a little more years more advanced than the ISS, about 400 to 500 miles in orbit. And their serviced by these triangular craft that--you know, the TR-3B-type--

SMITH: Yes--

GOODE: --craft.

SMITH: I'm familiar.

GOODE: And we have a few other manned satellites that are in space--

DAVID: Hold on, you said you're familiar. Could you please explain that?

SMITH: Well, while working at the Space Coast Aeromedical Institute, we were contracted out as astronauts to go, actually, to these places and run some tests for long-term space travels for human beings. They were trying--

DAVID: Really?

SMITH: --to find out a way that we could make your body last a lot longer in space before it starts breaking down.

GOODE: Where were you going to do this testing? Because there are a few facilities that have Air Force astronauts. It's a whole other astronomical--

SMITH: Oh, I understand.

GOODE: Yeah.

SMITH: Well, I--like I said, I was working in Florida at the Space Coast Aeromedical Institute when I first developed my platelet-rich plasma stem cell device. And they thought there would be some use for this regenerative properties in space. And they wanted to see if you could still concentrate these cells in space and if they would still be viable to give to the astronauts for long-term space exploration.

DAVID: Now, we're all kind of space nerds here, but in case somebody isn't, could you just explain in a very simple way what happens to the humans, whether they're Russians or Americans, in conventional NASA-type missions?

SMITH: Sure--

DAVID: When they go up in--

SMITH: I mean, well, the body, number one, you have to eat. And you have to stay healthy. And you have to exercise every day. And you've got to keep it in full motion and movement. Just like anyone here, if you sit in bed all day and you don't do anything and become obese, you know, you're going to set yourself up with heart risk factors and all sorts of problems in your body with disease. So by doing the basic things of keeping your body healthy in space, that's just keeping you at homeostasis. But what they want to do is, well, we want to keep you at homeostasis, but we also want to do that for long periods. They can only keep homeostasis for a short period of time in space, you know, up to a year, like, the maximum.

GOODE: The bones--

SMITH: Everything starts to degenerate. You know, you lose 20% of your bone structure. And it also taxes your neurosystem--

DAVID: Are you talking about, like--

SMITH: --tremendously.

DAVID: --osteodensity of the bone?

SMITH: Yes, the density. That's right, the density. And so there's all these factors going on up there. And it's been kind of a big problem for NASA, number one, which is the public NASA. And this is the one that got funding for us to go do this project we were contracted out to do. So that is, you know--now, there's two NASAs, in my experience. So I'm not sure--you know, you can probably enlighten me some more that's separate from everything else. You know, the secret one, and then there's the regular one. And then of course there's the Air Force and whatnot.

DAVID: Well, could you describe the secret one? Because I haven't heard about this, per se.

SMITH: Well you're talking--the secret NASA?

DAVID: Secret NASA, yeah.

SMITH: Well NASA has--

DAVID: What do you know about?

SMITH: There's two sections to NASA. One is what the public sees. And there's another underground cabal-type one that does really mediocre stuff as far as getting things to space for these other classified places. So their mission, honestly, is more on a supply-type thing for them, because they're kind of, like, the lower echelon compared to these other ones that Corey is talking about. But they still contract them out to do things. And everything is secret. And they also send many different types of satellites up that are classified. Of course, right now, with the new advent of Elon Musk and his corporation, he's actually doing a lot of this, sending these types of classified satellites up, that are used for negative purposes, into the space--not to say that they're aware of that, because they just make the rockets. You know, these satellites come already in a capsule. And they put it all together and shoot it up. But they're contracted out to do that, because they're very successful, more successful than, actually, NASA at--

DAVID: Corey--

SMITH: --making rockets.

DAVID: --have you heard about this secret NASA?

GOODE: Well, yes, this, it is actually the same part that I was talking about of the secret astronaut corps that is--they're almost all Air Force.

SMITH: Yes.

GOODE: And I'm trying to remember the name of the base up in the Northwest that they do a lot of their training at--not Northwest. It's close to one of the Great Lakes. There's a base where they train these people to fly this advanced technology.

SMITH: Right.

DAVID: OK, well we have a viewer question now. Corey's Mega-Update mentioned seeing a NASA-badge-wearing person at the deeper part of the LOC--a NASA badge. What are the implications of this? And is NASA's presence on the LOC a new thing? And this, I guess, Corey, that's more of your question--

GOODE: Right.

DAVID: --because--

GOODE: Previously, at the LOC Alpha, which is the one that I've described most often, I had never seen any type of NASA insignia. Now, at the LOC Bravo, which is underneath the surface below this giant lava tube network, it--when I went there before I was given a five-hour tour of the rest of the complexes on the moon that we have, some of them very ancient, I was in a more scientific area where they, everyone was preparing to go on further expeditions down in, you know, putting on equipment and all of that. And there were some NASA personnel there, a person in a orange jumpsuit with a NASA insignia. And there was a person standing by that had like a blue windbreaker on that had a NASA insignia.

DAVID: So what are the implications of this? And is NASA's presence on the Yellow Sea a new thing?

GOODE: Well, the moon bases are segmented in a way to where different space programs have access. The military industrial complex does a lot of work there. And what we had described earlier about a secret NASA faction that is made up of the Air Force that he described and that I can confirm, those are the people that I was most likely seeing on at the LOC.

SMITH: Most likely, yeah.

DAVID: So either one of you guys jump on this. It's a strange thing, that seems related, that every now and then, we just get this little blurb in the media--this been going on for years now--about this X-37B. It looks like the space shuttle kind of, same kind of thing, like the re-entry vehicle part. And then they just say, yeah, it's been up there for 648 days with astronauts inside. But then they don't tell you who the astronauts are. They say it's a secret mission. And then they land it. And then every now and then, you just hear another one. And they say it's been up there for about a year, maybe two years at the most.

GOODE: Well, these are unmanned. They're--

DAVID: Supposedly.

GOODE: Right.

SMITH: I think they're unmanned. I didn't know there was people in those.

DAVID: Oh, OK.

GOODE: Yeah, these are remote-controlled vehicles.

DAVID: It seemed I saw some of these articles implying that it was not unmanned, that there were people in it.

GOODE: It has a capability, but from what I've seen, it's a very small cabin. Usually it carries payloads. And the payload can be--and it's not something that you eject into space, so it can be attached. Like, the doors can open. And it can position itself to work, to have arms come out and work on satellites, repair satellites. They can fit it, retrofit it to do many different tasks, so I'm told.

DAVID: I just find it really surprising that people aren't asking more questions in general, given the fact that we're told every year or so that there's been a secret space mission that just landed after a year.

SMITH: David, does it make it to mainstream media?

DAVID: Yeah, absolutely.

SMITH: Like, so CNN is actually talking about it?

DAVID: X-37B.

SMITH: No, I know.

GOODE: Well, they'll mainly talk about the take off and the landing.

SMITH: Oh, OK, all right.

DAVID: But then it's like, well, what's up there that they're working on? And why would they want to be up there for a year? What would be the requirement to have this mission be in space for a whole year if there was nothing there to work on?

GOODE: Well, a lot of types of experiments that the astronauts do can be automated as well. So they can send up, you know, advanced experiments as well.

SMITH: Oh, absolutely, there's craft now, like this one, and even space stations that are unmanned, like you were talking about, and smaller ones. And just like in surgery--we have these big da Vinci robots that go in and do the whole surgery, but the surgeons over there operating it--

GOODE: Or in a different country.

SMITH: --or in another country. So up there, they can do the similar, very similar thing, like huge was talking about fixing satellites, cleaning up space debris that is in the way of a satellite--that's very expensive--has been done, missions just to go up there to change the trajectory. And they couldn't do anything about it. And they're going to lose a billion-dollar satellite. So you know, they'll go up there and clean up that little area with the elliptical--you know, how all the space trash is going around. I've heard of that too. But you know, there are also, getting back to the Air Force and NASA too, definitely, they're all working together. And I totally support that, 100%. Because they are all Air Force astronauts that run these missions. And they're all trained separately.

DAVID: You said something provocative, which is, you said that you were one of these astronauts.

SMITH: I was scheduled to go up in one of the shuttles, yes. And luckily, I didn't, because the one that got blown up over Texas was my return flight. So that was back--

DAVID: Oh, you're actually saying the regular space shuttle?

SMITH: Yeah, the regular space shuttle.

DAVID: You were going to be a conventional astronaut?

SMITH: Yeah, for that one.

GOODE: Yeah, and when I was in the--

DAVID: Wow.

GOODE: --Texas State Guard, my unit ended up helping clean up a lot of that explosion.

SMITH: Yeah, and that was definitely a hit on all those people. That was not just an explosion. Those are all targeted for--and the reason I know this--

GOODE: Did they see something they weren't supposed to, or?

SMITH: Huh?

GOODE: I mean, why would they target a shuttle? Did they see something they weren't supposed to?

SMITH: Yeah, those people on there, I don't know the background, but they all had something on them that, you know--or the majority of them in there had something that they needed to make sure would never was spoken of ever again. And I supposed to be on that return flight, but my flight got bumped because of the budget cuts by the president at that time--bumped my flight actually about two years. And after that blew up, they canceled the whole shuttle program. I didn't get to go up. So I was very upset with that one. But it still did work for the other NASA, and did some other things.

DAVID: Do you think that some of the conventional shuttle astronauts that we saw were aware of classified things as well?

SMITH: They can. They could be. Most of the astronauts, as you know, especially the ones that go to space, are under a huge NDA--

GOODE: And most are Masons, as well.

SMITH: --with a bullet--with a name on their bullet if they were to say something. You know, I've met with a lot of the old astronauts' families and themselves before passing away. And you know, they all did say, you know, that this is true. The moon is inhabited. There's many, many vehicles there. There's extraterrestrials there. And this is all public information you can find out online. This is nothing really new. And people grasp this, but no one questions it. So it's kind of the largest story in the world is this extraterrestrials. And no one wants to, like, really get into it and talk about it.

DAVID: So Corey has brought to the table information that corroborated something I heard from another insider, and that is this idea that you have a level of the Secret Space Program that doesn't believe extraterrestrials exist and doesn't believe that we can leave the solar system. So Corey, could you explain that a little more? And then we'll see what Emery has to say.

GOODE: Sure, most of them believe that extraterrestrials exist, but they believe that the only ETs that have visited us have done so in the ancient past. And every once in a while, an interloper may come into our solar system, but other than that, there's not a whole lot of extraterrestrial traffic, which is amazing, because they are in a perfect position to spot this extraterrestrial traffic.

SMITH: I can't see how that's possible, them being up there not seeing.

GOODE: Right, well, a lot of them, they'll see secret space program craft from the Navy program that are far more advanced. And the pilots will be like, what did we

just see? What is this? And they're ordered, do not talk about it. What you saw was a concept craft. You'll probably be flying one in five or 10 years.

SMITH: Oh, OK, so they're brainwashing them.

GOODE: Right.

SMITH: That's why.

GOODE: And also, you know how they positioned--satellites are positioned in a certain orbit. They know where every asset is at all times, even before astronomers task a satellite, they know what's going to be in that region and what could possibly be seen. And then they change the position of assets.

SMITH: Oh, I see.

GOODE: So it's like a big shell game going on up there. So but you might have a space station here, and doing an equatorial-type orbit, but some crazy stuff going on down in Antarctica that, you know, they won't be able to really see. They can, depending on where they are in the orbit, they can have activity occur.

SMITH: And who--why would this organization not tell their astronauts about the ETs? And why do they not--what is the benefit of that? How does that serve that--

GOODE: It's compartmentalizing ideas. So if these people start coming forward and they're disclosing this technology or some of the technology, they can say it was human derived, or, you know.

SMITH: That makes sense. I mean, they did a lot of that stuff to us, trying to say this is this and this is that, even though we knew it wasn't. We just know to keep our mouths shut.

GOODE: Right.

SMITH: But yeah, that's a common tactic for that. But space programs are hard. And they're growing so large right now, that there's just many of these craft up there with humans in them. And hiding them, the extraterrestrials up there is--would be very difficult, I would say. But it can be done.

GOODE: Well, what's interesting is this Military Industrial Complex Program had been a major tool of the Cabal for a long time. But now, that's kind of been wrestled away from them as we've--the DoD types have of come back more towards the direction of the Alliance. So it's more of an Alliance representation in this program now, although there are--it is split a little bit. Recently, they interact--I guess,

intervened, in something that occurred here on the planet.

SMITH: Oh yeah, you told me about this, I think.

GOODE: Yeah, most people don't know that the CIA has a secret fleet that, strangely enough, they call the Dark Fleet. And it's comprised of a nuclear submarine, a nuclear aircraft carrier, some prison ships, hospital ships, just on a--destroyers, an entire fleet. And it's kind of a rogue fleet. And recently, I was told that, in a briefing--we haven't fully confirmed all the details yet--but these were retired general and colonel types speculating that the nuclear sub had gone into a shallow area close to North Korea and had fired an ICBM at Honolulu. And of course, we all remember the--it was all over the news--

DAVID: Oh yeah.

GOODE: --the fake missile alert. But if you look deeper in the news, you see some interesting UFOs reported close to Hawaii during that time period, weird corona in the sky. And also, someone reported an explosion in the sky, possibly a meteor. Well--

SMITH: Right, I remember all of this.

GOODE: Yeah.

SMITH: Seen all over, even Russia saw it.

GOODE: Yes, so what I'm told that they believe happened, was that this rogue submarine fired a missile. The secret--the MIC, Secret Space Program, took it out and intervened. And that's what the explosion was that they heard over the ocean.

SMITH: Wow.

DAVID: So that implies that the MIC group is at war with the group that would be controlling the CIA.

GOODE: Yes, but parts of the MIC group are struggling with each other as well.

SMITH: Yeah, that's really good news to hear, that the MIC did that. Because if not, the extraterrestrials probably would have done it, because they're not going to let any type of nuclear bomb go off if it destroys more than half the planet.

GOODE: Well, it also causes an energetic feedback through this cosmic web and affects countless other civilizations.

SMITH: Exactly.

GOODE: Especially if they're in transit through the cosmic web, we can destroy ships or an entire fleet if a nuclear bomb goes off at the wrong time. They go through regions. And they know the activity of all the suns, stars in the area, because of their pulses--

SMITH: Flashes, yeah--

GOODE: --and the flashes.

SMITH: --solar flashes--

GOODE: And it feedbacks--

SMITH: It affects everybody.

GOODE: --into the--

SMITH: I'm glad you said that. Not many people understand that concept and how it affects--everything we do here affects another part of the universe, many parts, actually. So I'm glad you brought that up.

GOODE: Apparently, a few days later, the same submarine tried to fire another missile at Tokyo, which was, again, taken out by the same program.

DAVID: What did they do with the submarine?

GOODE: The submarine, I've heard--I haven't heard any details about what happened, if they engaged the submarine and took it out. I haven't heard any of the details.

DAVID: It would seem likely to me.

GOODE: It would be likely.

DAVID: Yes.

GOODE: But I'm waiting for a full briefing to see how correct these details are, because they were coming from people that were--that had inside knowledge, but not the full picture.

DAVID: Corey, why do you think the Cabal would have tried to fire missiles at Honolulu and Tokyo right now?

GOODE: Well, you know, false flags--right now we have to keep an eye out for false flags. Because this Cabal group, this global Cabal group made up of people from all religions, all political ideologies--you know, it's everybody, there's a little piece of

every group involved with this--is finally being exposed. And they need to have a grand distraction. And it looks like they were leaning towards a starting the World War III to have a distraction instead of showing us some of the things that are hidden down in Antarctica and under the ocean.

SMITH: It also sounds like, to me, I'm catching that this could also be a test of the response time for--you know, we do this a lot. You know, shoot missiles and see how fast they--they know they're getting it taken out. They want to see what the response time is so they can strategically position themself in different areas, and also maybe manned space with something to counteract that threat.

GOODE: A little probing.

SMITH: Yeah, so it could also be something like that as well, that they're testing.

GOODE: That's always a component.

DAVID: Emery, I want to jump back just for a second to something you said that was provocative. And that was that you mentioned the secret NASA is using triangles. And they have bases in somewhere outside the Earth, or in Earth orbit, I guess. So could you please just explain what you know about that a little more now?

SMITH: Well, there is a flight of them at MacDill Air Force Base there in Tampa, Florida.

GOODE: Oh, yes.

SMITH: And--

GOODE: As a matter of fact, Dr. Salla of exopolitics.org has recently written several articles. Before the last hurricane--I can't remember the name of it--hit Florida, people were photographing them evacuating these craft from MacDill. And there are two or three different types of these triangles, I'm told, that are stationed there. A full wing is stationed there at MacDill.

SMITH: Absolutely, we've done a lot of CE-5s about an hour south of--half hour south of there. And you know, they're not hiding. I mean, these pilots are going out over the Gulf of Mexico and doing some amazing acrobatic things, and just for fun. And they're not hiding is what I'm getting at. We've got these guys on film, got them on pictures, and whatnot, witnessed by 30, 50 people during a CE-5 on the beach there. And it's quite the spectacle. And but you can sense too that it's not extraterrestrial. It always has that kind of energy of man-made alien reproduction vehicles. ARVs, we call them.

GOODE: Yeah, 90% of what we see is man-made.

SMITH: Exactly, great number, 90%. That's very true.

DAVID: Well, you were starting to go into the secret NASA. So you mentioned triangles, MacDill. That's an amazing correlation that you both know that same base. Could you tell us a little more about the orbital platforms, for example?

SMITH: Well, there's space stations up there, like Corey said. And they're much grander than what we--that you guys know about with the International Space Station. They're highly upgraded. They're about anywhere from, from the pictures I've seen--I haven't been to one of these, by the way--they're about 10 times bigger than the ISS. And they're not right here in our atmosphere, like we see our satellites and stuff. They are farther out, what we call exoatmosphere, you know, beyond the Earth, but still in a--and they can be in an elliptical orbit. Or they could be at standstill somewhere. And many things go on at these space stations, such as testing for other planets they're searching for. They sometimes--

DAVID: Like Earth-like planets?

SMITH: Yes, like Earth-like planets. They also have special radars on there that can see into planets. And they have things that could actually--they know where all the craft are in, like, our solar system. And they also map all the different wormholes and these other platforms out there for jumping around in space. So they know where the portals are. They know which planets have portals. They have been investigating with very high-tech equipment on there. They can look through the clouds of all the gaseous planets and see what's really there. And they send a lot of probes out to these areas to send them through and to see if they come back so they can get the data.

GOODE: So you saw a picture or a photograph of one?

SMITH: Mmm.

GOODE: OK, I've described one in the past. And it was a space station that was created out of NASA ship hulls, or out of the rocket boosters, that they had repurposed, that had ejected from other rocket launches into space. They repurposed them, put them end-to-end into, like, a big circle--

SMITH: Right.

GOODE: --that were like a spoke radiating from--

SMITH: I told you, this--

GOODE: --the middle.

SMITH: --before.

GOODE: And it spun slowly to create one-third gravity.

SMITH: Right, and that's that--this is the one. I actually told you about this a while ago.

DAVID: Yes, You did.

SMITH: So to hear him say it, it's very--it's enlightening to that--

GOODE: And the images I saw were, the spoke in the middle had an area that went down. And everything else was, like, turning, but the middle was fairly positioned where it wasn't moving around. And that's where the TR-3Bs would connect, was at a port here, here at the top. And they would come through. And they would go out through the spokes and go to the sections of the station that were created out of these reclaimed--

SMITH: Right, reclaimed

GOODE: --parts.

SMITH: Even NASA recycles.

GOODE: Yes.

SMITH: Isn't that nice?

DAVID: And you said this is an Air Force program?

SMITH: Yes, right, it's the Air Force.

GOODE: DIA.

SMITH: Yeah, so I mean, it's kind of well-known for the people that are in those projects. They don't keep it that secret.

GOODE: It's well-known, yeah among the project, those projects.

DAVID: Now obviously, the programs that you were involved with, you were aware of extraterrestrials being in and around the Earth.

GOODE: Yes.

DAVID: Do you think it's possible that they could have employees on those space platforms that wouldn't have been informed about extraterrestrials or think that it was only ancient, for example?

SMITH: No, I don't see how that's possible, no. I can't see an astronaut being on that station being convinced there is no other life out there, because it's such a hot zone out there. In space, it's like Grand Central Station for--you know, it's just, it's a really busy place. And you'd have to just have no windows and not be looking out at all for you not to see some anomaly or for you to actually see an extraterrestrial craft right outside you investigating you. You know, there's so many weapons in space to counteract this including special wave patterns that do not allow craft to come near or it will disintegrate that type of craft. They also have all these neutrino light detectors on the satellites up there, which show the travel of these craft in different wavelengths so they can pinpoint them and see who they are.

GOODE: Well, and the fact, how the lunar operation command tracks craft coming in is that any type of free-energy-type device puts off a certain frequency--

SMITH: That's right.

GOODE: --that you just, you cannot hide. You cannot shield it. That's why that so many of these people, free energy workers, they'll be in the middle of the jungle, underground. And the minute--

SMITH: Doesn't matter.

GOODE: --they turn it on, helicopters are all around.

SMITH: I can attest to that myself.

GOODE: I bet you can.

SMITH: And you know this very well. And I don't mind coming clean with that one.

GOODE: But that's one of the methods, main methods they use for tracking friends and foes coming in.

SMITH: Yes, you can't hide that energy. So that's a difficult one.

DAVID: Well, you were working on a device. And very soon after it started to work successfully is when you had that car crash.

SMITH: Right, well in Florida, you know we took a device to a Walmart shopping center. And we had some scientists and some interested people, VIPs, that, you know,

wanted to make sure it worked. So in the rental van, we pulled up to Walmart after hours. And when the lights all went off in the parking lot, we just pulled it out, laid it on the ground. I told everyone to shut off all their cell phones and put it around the device. And we turned it on. And all the cell phones turned on. And all the lights in the parking lot went on. See you, bye bye--that lasted, like, less than 45 seconds. It was in the van and going again. And that Walmart parking lot was really busy for the next 24 hours. And it wasn't for shopping.

DAVID: Emery, do you think, based on your contact with these people in this program, did they want--were they happy about the secrecy? Or did some of them want the truth to be known to the public?

SMITH: That's the big thing. People want the truth now that are in these projects. They don't feel safe. Things are happening. Things are changing. They're not going to do anything. They're not going to become a whistle blower or anything, I don't believe. The retired ones all want to come forward. But the ones that are on the projects, these people need a job. They're just a little fearful. They all have a little bit of fear. And they do that on purpose. They give you a little fear factor when you work on these projects to make sure you don't go astray. But the thing is, their heart's in the right place. As long as their heart's are in the right place, something good is going to come out of it. Even if you're doing something you really don't want to be doing, you know, there's a reason why you're there. So what I'm telling those people is, be patient and keep thinking that way, because pretty soon, you're going to be free. And you're going to be doing a very similar project and working the same job, but you don't have those eyes and all those people looking over your shoulder all the time.

DAVID: Well that is some amazing stuff. And Emery, it's just awesome to have you here. And thank you for risking your life to be a part of this.

SMITH: Oh, you're welcome. Thanks for having me, Dave.

DAVID: This is "Cosmic Disclosure." And we thank you for watching.

Cosmic Disclosure Season 12

Corey Goode, David Wilcock, et al

Time Travel & Shifting Realities Season 12 Episod 1

Cosmic Disclosure; Time Travel & Shifting Realities Season 12, Episode 1

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith. Time travel technologies--do they exist? And if so, how are they being used? Emery, welcome back.

EMERY SMITH: Thanks for having me, George.

GEORGE: Time travel technologies--exactly what is it? And what's involved with it?

SMITH: Well, what they're trying to do and replicate is portal technology that they have discovered from an earthly origin a very, very long time ago. And there is a connection between this type of traveling that also affects time and space. So they are trying to actually replicate that, and make that into electronics, and make a synthetic version of this. And they have. They have actually done this. They have not perfected it yet.

GEORGE: Now, when you say "they," who are we talking about?

SMITH: We're talking about the compartmentalized projects that the security is only run by the military but the project itself could be owned by major corporations that are clandestine that get funded by the governments around the world to make other technologies for them, whether it be for wartime, peacetime, or pharmaceutical. So these monies that are made from these smaller projects that they're doing funds their secret projects, such as time travel and things like this.

GEORGE: So specifically, Emery, how does time travel work? Because we hear all kinds of things and all kinds of possibilities.

SMITH: Well, the first thing you need is a lot of energy, number one. A lot of the side effects of these zero-point energy overunity devices create this type of rip in time and space. And it has to do with infolding space on itself, actually, and opening up the space within time right here in front of you, because that right there is how our extraterrestrials actually travel through the universe and interdimensionally. They're creating their own field of energy, number one, which is their own gravitational field that they sit in. That's why they can do these billion mile an hour right-hand turns and nothing happens to them, because they're in their own field. And by putting energy and focusing it in front of these craft, they can actually open up interdimensionally a space rift in time and go through it. And that's why they sometimes just--poof--

disappear in space.

GEORGE: Do they have a dial on any apparatus, and they could click to 3015, and poof, you'll show up there?

SMITH: Well, it's kind of like that, but it's called consciousness assisted technology. And it's all done with their consciousness. The craft also are integrated with the beings. Some of them are actually grown, these craft, and they are matched to the DNA of the pilot. So all the pilot has to do is think of that dial turning to 350, whatever, degrees, and poof! They're gone.

GEORGE: There they are.

SMITH: Yep.

GEORGE: The more and more I watch you on "Cosmic Disclosure," I hear new information that just boggles my mind. In this particular case, how do they use this kind of technology?

SMITH: Well, what they're doing is--like I said, time is a very sensitive subject with the physicists and the scientists around the world that are not part of the clandestine projects, because it's a hard thing to grasp, because time really doesn't exist. And what's going on is there's multiple levels of time right now and multiple different types of realities and dimensions. So there is a dimension right now, just within a different frequency right now, where you are here, and I'm here, and it's just a little bit different. Maybe these coffee cups are not here or the cameras. Or it might be some different people. Because there's many different levels. The hardest thing to explain is that time is irrelevant, because you are already here everywhere, all the time, which means--I know it sounds confusing.

GEORGE: But don't go back and see your grandfather, right?

SMITH: Right. And that's a big question I get. Like, what if you go back in time and you did something? Well, you just created another time reality. So that's another space of time. But you're still where you're at right now. And if you think you can go back, and remove the coffee mug, and then all of a sudden it's not there, it doesn't work that way at all.

GEORGE: I mean, if you wanted to go back into time, and do away with Hitler, and prevent World War II, and the Holocaust, and all that horror that he created, what would happen if you went back into time, took care of him, got rid of him? And what would the consequences be?

SMITH: Consequences would not affect you, because in this reality, that never

happened.

GEORGE: Interesting. But would there be a reality somewhere--

SMITH: There is.

GEORGE: --where it did happen?

SMITH: Correct.

GEORGE: And what would happen there?

SMITH: Well, it's what's happening right now. That's the paradigm here, is trying to put all that together, saying, OK, there are multiple dimensional realities, and there's multiple different types of time zones that we are all part of. We are interdimensional multiple-dimension beings. And that's where frequency comes in with DNA, and genetics, and how we affect other worlds and other places in the universe, where the light we see from the stars today, that star might already be out. But because of this distance and time continuum, we don't really think about that and realize that.

GEORGE: What if there are other universes, the multiverse exists--

SMITH: Oh, right.

GEORGE: --would different time things occur in those different universes?

SMITH: Right, exactly. I get that question a lot too. So the different universes have another George and another Emery there. And at this time, you have to realize that it's a whole other timeline that we're part of but we're not because we're here. That is the best way I could put it.

GEORGE: These programs--I'll call them the "time programs"--

SMITH: Sure.

GEORGE: --were you involved with them specifically? And if so, what did you do?

SMITH: Well, there was a program I was involved with where they were using a special type of Teslatron unit, where we would take a watch in with us in this small hexagon room and spend supposedly 55 minutes in there. And I remember the first time after working with this project for many years to even become one of the people to go into it that you have two watches. And you put one in your locker room. You lock it up. You take the other one with you into this device. And the first time, after waiting two years to get into it, I was so thankful that I was finally able to get the proper security clearance and to get into this device. And going into this device, as

they ramp it up, I remember hearing after just 15 minutes this knock at the door saying, OK, Smith, you can come out now. We're done. Because I heard the system ramp up and--

GEORGE: You probably were in there nine years, and never--didn't know it, right?

SMITH: Well, exactly. I was in there for a whole hour. And I had no idea. So I got--

GEORGE: What did it feel like?

SMITH: When I came out, I was so upset. I was so distraught, saying, man, what happened? Did the system have a malfunction? And then all the scientists are looking at each other, and they're all over a hundred years of age. And they're laughing. And they said, oh, didn't you check your watch in your locker? And I said, no. So I missed a good 30, 45 minutes.

GEORGE: And didn't even know it.

SMITH: And I did not know it, because the 15 minutes I was in there, really, I felt--it was an amazing experience. You can see the universe. You could see space. You could--it actually detoxes you and teletransports toxins out of your body. Sometimes people lose up to 15 pounds on these trips that they go in there.

GEORGE: In one sitting?

SMITH: In one sitting, in 55 minutes. And I always asked, where does that go? Because I still had the same hydration when they did the blood test. And I'm not dehydrated, but yet, all the horrible negative ionic bacteria, viruses, and metals in my body were taken out. So people that are really toxic that go in there, really a lot of the stuff gets--

GEORGE: They come back healthy.

SMITH: Right, they come back very healthy. It's used to treat cancers for the elites of the world. Even our presidents have been there.

GEORGE: What's the machine look like, Emery?

SMITH: It's a hexagon room. And inside the hexagon room is a glass wall. The hexagon room is only about eight feet in diameter.

GEORGE: So it's small.

SMITH: So it can only fit a small massage table that's in there. And three feet beyond the massage table is a three-inch glass or Plexiglas wall. And behind that is this giant

Teslatron unit. And it amps up this amazing electromagnetic frequency, where it rips time and space apart. A lot of side effects of zero-point energy devices do this. And a lot of scientists, including Tesla, have witnessed this and wrote this down, that there's some field, this sphere that forms, which has happened to me in my laboratories, where the time is getting distorted for a moment.

GEORGE: Sure.

SMITH: But with this device, they really perfected it pretty well. We always were trying to find out, wow, there must be some dimension somewhere where someone's sitting there, maybe an extraterrestrial, and a big wad of fat comes down and hits them in the face or some toxins.

GEORGE: [LAUGHS]

SMITH: Someone just dumps a bucket of something. So it's not perfected yet, because they're still trying to find out, well, where does that go? Where did the tumor go? Where did the cancer go, the cells? Where did these viruses go?

GEORGE: So they're just gone.

SMITH: They're just gone.

GEORGE: How does it work in terms of curing people?

SMITH: They're still trying to figure it out. And the best way I could describe it is it somehow attracts the negative ionic components of viruses, and tumors, and also metals that are not beneficial for the body. It latches on to them somehow through this energy field that's in there. And it teletransports those things out somewhere.

GEORGE: It sounds like it also changes the bad cells. Does it?

SMITH: I don't think it changes the bad cells. I'm pretty sure it removes the bad cells. But it upregulates the frequency of the DNA. And it also helps fight infections and things like this. Usually, once you get out of one of these devices, for me, I could not sleep for three days and be completely fine. You have a great urge to work out. I think I ran the furthest after having a treatment on one of these devices, because I used to jog a lot and work out a lot. And that was very noticeable. And they said this would happen. They said, you will have an immense amount of energy, and you will have an immense amount of cognitive function. And meditation was just amazing. You can immediately just close your eyes and be anywhere you want, if you were a good meditator and you knew how to do just regular meditation steps. So it has amazing functionality to the frequency of the DNA of the cell and the nucleolus of the cell and also upregulating those energies, because it's all about keeping your body at the right

voltage. And I think by removing the contaminants out of the body, which affects your voltage, it allows you to heal yourself.

GEORGE: Interesting.

SMITH: In our studies, just with this one project--and there's many projects we'll talk about--but with this specific project, you're really going in there to get treated for something, for an ailment.

GEORGE: OK.

SMITH: But what the side effect is, is time.

GEORGE: Right.

SMITH: It's losing time.

GEORGE: You lose time. But you don't age, right?

SMITH: Right. Right. And that's why all these scientists in this underground facility--in New York, actually--were so young, and vibrant, and over a hundred years of age. And I remember working on some things for them just as a technician, listening to their conversations, and they were talking like they knew Tesla. And they had a lot of--

GEORGE: They probably did.

SMITH: I know. And it was electrifying to know. Wow. I wish I really knew exactly how old they were. And this is a civilian-owned device that was made from naval scientists that retired early.

GEORGE: And it must be so perfected now, I would guess, right?

SMITH: Well, I think they're trying to do something. I tried to contact them a few years ago to see if we could maybe get this technology out to the public. And one of the head scientists became ill, and I have lost contact with that group. But we're still trying to figure it out. I think it's going to resurface soon, because the medical benefits of this time traveling device is unprecedented. They were able to cure HIV in 30 days, herpes in--

GEORGE: By being in the device?

SMITH: Just by being in the device three times a week.

GEORGE: Does it cure everything?

SMITH: Well, I don't know about everything. Just the documentation I've seen and heard was with cancers, and herpes, and HIV, STDs. Because a lot of the--

GEORGE: Well, why do they suppress all that stuff, Emery? Why don't they bring it to the public?

SMITH: Well, the FDA will definitely not approve that device, no matter how much documentation they have.

GEORGE: Why?

SMITH: Well, you're going up against big pharma, the big moneymaker. They need you to take these pills. They don't--

GEORGE: So you're saying they don't want the cures.

SMITH: They do not want the cures. And I can attest to that, being the inventor of the first tabletop stem cell concentrator and submitting many documents to the FDA of helping paralyzed patients and things like this. And you could send in a thousand studies of a new technology that many scientists have tried to do--

GEORGE: Of course.

SMITH: --here in the United States--

GEORGE: And nothing happens.

SMITH: --and nothing happens. They say, oh, well, you need more data. So they just keep leading you on, leading you on till you get so tired and you run out of money. Because most scientists and smaller corporations don't have that kind of capital to keep testing, and testing, and testing.

GEORGE: Emery, we've talked about these scientists that you would see through this time device. And you said they were a hundred years old. Where'd they come from? And why were they so old?

SMITH: Well, it's not when I was inside the device. They're the ones who invented this device. And they were definitely born on Earth. They were all ex-military scientists that retired--

GEORGE: May have worked with Tesla.

SMITH: They obviously had worked with Tesla, the way I can hear them talking behind the scenes and joking around. They were all in excellent shape. They were all over a hundred years of age. They were still aging. They didn't get that secret figured

out yet. But the fact that these people in these compartmentalized projects who have been there forever--by the way, these are civilian-owned compartmentalized projects, but they are ran by ex-military scientists.

GEORGE: Emery, how advanced are we, in your opinion and based on things you saw, is our time travel program? How advanced is it?

SMITH: Well, they can do it, OK? It's not that effective, such as--I would probably say a recent offer I got to come back to a project because the entire team had passed away during one of the missions, and it has a very--

GEORGE: They died?

SMITH: The mortality rate, it's not that great. So--

GEORGE: Something happened during the experiment?

SMITH: Something happened. And these were people I had known for 20 years or more.

GEORGE: You seem a little emotional talking about this.

SMITH: Well, they were very close friends of mine in the projects. I have not talked to them in forever. But when I was notified of this position, first thing I asked was, well, how is commander so-and-so, how is this person, how is that person? And they said, well, there was an incident.

GEORGE: Oh, jeez.

SMITH: And then I knew. And they just said, that's why we want you. And so just like an astronaut that goes up to space to risk his life or to the moon--

GEORGE: And they go there knowing they may not come back.

SMITH: They go there knowing that you might have just a 70% chance of survival. There is these numbers and ratios that scientists come up with. So it's not worth me right now getting involved with these projects anymore because it's too dangerous because of everything I'm trying to get out to the world. But at the same time, it's good to know that they're still working on these projects to help figure out the physics behind them and the science. And a lot of these projects have mission-oriented goals for time travel. One of the missions I had been on as a young sergeant was to go through these types of portals and time travel devices to just collect certain amount of rocks, and dirt, and flora, and fauna.

GEORGE: From the past and the future, I guess.

SMITH: Right. And I don't know where exactly I was on the planet or even if I was on this planet. And we would only be gone--it was always a specific 15 minutes in and out. But as we'd get back, we'd be gone three or four hours in real time, at this time. So--

GEORGE: In real--but when you came back, how much time had gone by?

SMITH: Three or four hours.

GEORGE: Three or four.

SMITH: I was only gone 15 minutes.

GEORGE: Oh, OK.

SMITH: And then everyone gets pulled out, and--

GEORGE: That's not too long. It's not like you came back and 40 years had gone by, right?

SMITH: No. Correct. But I know space travel--this is where it gets into the big time thing, with the further you go away from the Earth, that you're losing time because time here is speeding up as you're not.

GEORGE: Correct.

SMITH: Yep.

GEORGE: Emery, these missions are not very long--10 to 15 minutes at a burst. What are they doing with these missions? What happens?

SMITH: Well, like I said, each mission is different. One of the few missions I was on was to go there and collect some plant life, and some rocks, and some soil material.

GEORGE: To get in, to get out.

SMITH: And to get in and get out. One of the cool things that had happened on one of the missions is they had this giant leaf, almost three feet in diameter, like a vine leaf. And it was bullet-proof, this leaf.

GEORGE: Bullet-proof?

SMITH: Bullet-proof. The actual leaf--

GEORGE: It was that strong.

SMITH: It wasn't thick at all, but it was that strong. And a lot of these reverse technologies now you see here today come from these amazing excursions into time and through these portals. And one of the latest things that has just been published in the last two weeks was they took a plant, and they removed all of its inner contents and just left the cellulose material of that plant clear as a bell. And they were able to inject into this plant, into the veins, liquid. And it's the same type of vessels, the way it's laid out, as we have in our own body.

GEORGE: Remarkable. Have you traveled in time backward in time and forward in time?

SMITH: I don't know if I was traveling backward or forward, because I was never around people or any types of--anything that I could tell that it was Earth, known--

GEORGE: It's not like you could look at a calendar that said 1804 or something like that.

SMITH: It wasn't like what's-his-name on "Back to the Future" where he could type something in.

GEORGE: Michael J. Fox, yeah.

SMITH: Yeah. You can't--it's not like that at all. It's a great concept. But we haven't perfected it, that they want to go back at this specific time. I think they're experimenting, that they know people are losing time. And because they can take some sort of electronics with them now, which they weren't able to do in the past, and see that hey, we've only been gone 15 minutes, but we get back, and it's been four hours. What is that about? I don't know the physics behind that to explain it.

GEORGE: Did anything ever go wrong with you when you were doing this?

SMITH: Not me personally, but there was one person on our team for some reason did not come back through the time continuum device. And I don't know what happened to them. This happens sometimes. There's a fine line when you're walking in through these devices within four to six feet. And if you go off of that line, you're gone. So you have to--there's a lot of protocols involving getting through one of these devices.

GEORGE: When you arrive at a destiny in time, do you go through a portal?

SMITH: Oh, that's a good--that's a great--

GEORGE: Is that what it looks like?

SMITH: Yeah, it's like a veil. And it's not like you see in these movies, where there's this giant star gate with all these flashing lights. It really is a clear, blurry veil, just a veil like a curtain in front of you. And I can see right through it and see you. Like, if the veil was in front of me, I could still see you, but it's a blur. It's like a blurry--like a Plexiglas you're looking through. And soon as you walk through it, you're not there anymore. You're at your destination.

GEORGE: Poof! You're gone.

SMITH: Or you're gone.

GEORGE: So how do you come back?

SMITH: Yeah. Well, you just turn around, and at that spot is the special spot to get back, whether it be at a site somewhere.

GEORGE: OK.

SMITH: Usually, a lot of these things are already of earthly origin, meaning like a Stonehenge-type formation. The mechanical ones look like they're metal. They look like a picture frame, actually.

GEORGE: What if you get lost and you can't find that spot?

SMITH: Well, that's why these missions are limited to about 15 minutes, and they only go to certain areas. So you really can't run too far in 15 minutes.

GEORGE: OK. No, you can't go far.

SMITH: And you might be in a desert. You might be in a tropical zone. You might be in an arctic zone. It just depends on what the mission is. And all the missions I've been on, they've already had people go on these. So we had videos and pictures. And we knew what type of flora and fauna we were looking at and what to collect as far as crystals, and rocks, and things like this.

GEORGE: Who's behind these programs, these time travel programs?

SMITH: There's 300 major corporations that run this planet. And these corporations, a very small handful of them are involved with the highest tech stuff that's out there. So I believe that it's them that have conquered this type of stuff. They have also conquered reverse engineering a lot of the extraterrestrial craft, creating interdimensional craft that can go interdimensionally, which also is a time travel type

of thing.

GEORGE: Are they still doing this? And if they are, how advanced are they now?

SMITH: Well, as of six months ago, when I was offered this position, they're still doing it. So we know it's still a hot item. They're still trying to work out the quirks of it. That's the problem. Because if you don't know the physics behind this, you could cause a lot of damage. And you can also bring back things that are not safe.

GEORGE: Aren't you concerned for yourself, Emery? I mean you're talking about things that are supposed to be covert, I would assume, that are supposed to be secret. And you're risking a lot coming forward talking about this. Do you look over your shoulder sometimes?

SMITH: Yeah, I'm always on high alert, of course. The attacks have slowed down significantly ever since I stopped teaching about the zero-point energy devices and stopped really talking and inventing new cellular devices that help you heal. Since I've already have patents and all these things behind me, and it's a general public about my free energy lab I used to run--also, the devices that I invented there have been turned over to other corporations, that I have given them and still helping them develop it and perfect it. It is a very scary thing. It was. I mean, the reason the head-on collision happened to me was because I was transporting a zero-point energy device after it was validated. So I think that being said and coming forward in November with a lot of this information, I think it was the protection of the general public and people knowing, hey, now if they kill me, I'm going to look like a martyr.

GEORGE: Oh, no question about it.

SMITH: It's just going to be horrible. Everyone's definitely going to know now. And recently, we were gathering up about a few hundred documents that had been left over from my house being raided that we're going to show to the public.

GEORGE: That's what they did to Tesla when he died, too, same thing.

SMITH: Yeah. But I'm doing it ahead of time, hopefully.

GEORGE: Emery, tell me specifically about this accident. What actually happened?

SMITH: Well, for many months in California, I was working at an undisclosed location facility that was helping me validate a system. We were able to validate the system properly. So right after that, after an agreement was made for an exchange of other technologies for them to validate the system, I put it in the back of the Range Rover and headed down the mountain, I'll say.

GEORGE: Aha.

SMITH: And someone came out from around the corner--

GEORGE: Intentionally?

SMITH: Intentionally, with a long--we had a lot of time to think about what was going to happen. But there's a canyon wall on the right with just 3 feet.

GEORGE: Oh, jeez.

SMITH: And this person was not going to get back in his lane. So I just had a moment--second to turn. And it was a very vicious head-on collision of over 55 miles an hour.

GEORGE: Oh! You're lucky you're still here. My gosh.

SMITH: Yeah. Yeah, my hand went through the side window. And I had a concussion. Lots of lacerations, of course. With any type of a head-on collision, you're pretty sore for quite a while. So I was out of work for about three weeks and really couldn't do much. The thing was the device was spared, thank goodness, and was immediately transported to a safe place by another investor and a security team that was helping me out at that time. And now it's in a very safe place, in safe hands.

GEORGE: OK.

SMITH: And the information with that, it's a very fantastic thing, because they're going to come out next year, hopefully maybe March, April, and show the public my device and what we have done with this--

GEORGE: That'll be fascinating.

SMITH: --to help the world in a safe and effective way. Because I'm not out there teaching anyone how to do this, like the Bedini brothers were. And that's why they got taken out. And these are two other scientists that were trying to help get these energy devices out. But I was visited a very long time ago by the suits, and they said, we know what you're doing. We don't care. Don't sell it. Don't teach people how to do it. And don't hook it up to the grid.

GEORGE: And you'll be OK.

SMITH: And you'll be fine. So I--

GEORGE: Do any one of those three, then look out.

SMITH: I've never done that. So I've been very adamant.

GEORGE: What other countries are involved in time travel? It can't be just us.

SMITH: The only ones I can verify is Germany, China, United States of America, and a couple of facilities in Australia are trying to duplicate that that I know of first- and second-hand information. There might be others--maybe Brazil, maybe England--but I'm not aware of it.

GEORGE: I've always wondered if there are time travelers roaming around this planet right now from the future. What do you think?

SMITH: It's a possibility. It's possible. Anything is possible when it comes to time travel. It's just finding out through these time travelers and people--because I know there's a lot of stories out there, a lot of things going on. And we don't have agents that go out through these things, like Terminator, and go back and kill so-and-so's son so there's not this president born. It just doesn't work that way. If something like that were to happen, it would be on another timeline.

GEORGE: But don't they go back, Emery, and try to manipulate time? So how do we know that events that are happening right now--right now--the president's meeting with North Korea and things like that--how do we know that they weren't manipulated by some kind of time event?

SMITH: Right. One of the opinions out there and one of the hypothetical hypothesis is that you would not know, because, like I was telling you earlier, if someone were to go change something, it would not even be in your memory. And that's why I think this may--and this is just my educated guess--that this is probably happening, and we wouldn't even know, that because of the field of energy that we're all connected to, if something were to change in time, that you would already be programmed to believe that never happened. Or that when something changes and not everyone gets the change is what I'm getting at. So people are starting to remember. People are starting to be elevated in their own force field to realize, wait a second, I'm figuring this out, because they're having this residual memory attached to the endless field.

GEORGE: What would the motivation be, Emery, of manipulating the timeline? Why would they want to change things like that?

SMITH: The megalomaniacs that run this planet have all the money in the world. They have everything they could ever want. And I think it is some sort of disease they have--

GEORGE: A game?

SMITH: --that they're addicted to the secret control factor, not only controlling the mass population, but secretly controlling certain aspects of what can happen or what could happen if they changed something. So it's a control factor, I believe, that they may have, that they get high off this type of thing, releasing their own excitement of adrenaline and dopamine in their brain when they accomplish secret control over an individual or over a greater population, which includes death as well.

GEORGE: It's a power play, isn't it?

SMITH: Yes.

GEORGE: The deep state--we hear so much about the deep state. Were you involved with them?

SMITH: No.

GEORGE: You were not.

SMITH: No.

GEORGE: I'm trying to find an Emery Smith that may be involved in covert things. But that's not you.

SMITH: Well, of course, I was involved with a lot of covert things. But I don't use the pop culture term "deep state." When I was an active duty member and also a contract member of corporations, I was never doing anything that was negative or anything like that. So the deep state, I stay away from that kind of term, because for many of my colleagues and military veteran people who have been on lots of secret missions and things like this, we don't think of it that way, in agents, and spies, and things like this. We have a job, and we're supposed to do it. And most of the time you don't know really why you're doing it. And that's one of the reasons I got away from all that, because it's upsetting if you knew you were a part of something that maybe was negative towards a person or--

GEORGE: Oh, absolutely. Especially when you're a good person.

SMITH: Yeah, to the person or to the planet. But to my knowledge, I'm not aware of any of that in my career.

GEORGE: Do you remember the original movie "The Time Machine," where the professor invented a time device, and he sat in it? In this particular case, the apparatus to create time travel creates these portals. But you don't physically need to take a device with you, do you?

SMITH: Well, no, because the device is already there. And I'm glad you brought this up--

GEORGE: And it stays there, right?

SMITH: Right. It stays there in the field, in its own field. And one of the first times we got one of these overunity zero-point energy devices going in the lab, this sphere formed about 10 or 15 feet around the device. And myself and the scientists were in this sphere. And I just remember looking through this liquid sphere as we're inside a hollow sphere. But it's like a liquid.

GEORGE: Like a bubble?

SMITH: Like a bubble. And we could see different times of the planet. I mean, we saw dinosaurs. We saw beings.

GEORGE: Wow!

SMITH: We saw beings and things through this, like a window. Wherever you would look, you could see this. And it was so captivating. It was only for a brief 15 seconds. But it was like, wow. We just opened some sort of time rift or something. And we're actually viewing the planet right now as it was millions, and millions, and millions of years ago.

GEORGE: What a sight! What a sight. With time travel, is there that possibility that--because I think of it also as teleportation. Do they send you to another planet? And if they do, what if you appear without a breathing device or something? What happens to you?

SMITH: That's a great question. And what they do is they send drones through these thousands of times before they send a human being through. And some of these are programmed life forms. Some of these are mechanical drones with cameras on them. And they go through these, and they come back. And we have actual recordings of everything. Also, it's like sending a satellite or sending the probe to Mars to analyze the atmosphere and all these things. And you're right. You've got to be careful where you're going to be going into. And it has to do also with the ley lines of the planet and how the stars are aligned at that time for these portals to actually operate correctly and also to make it safe for these people to go through.

GEORGE: How fascinating. It really is. Are you familiar with Jason Rice?

SMITH: No.

GEORGE: I interviewed him on "Beyond Belief," and he will be appearing on future

episodes of "Cosmic Disclosure." Gaia had cameras rolling when he underwent hypnosis and a polygraph test--really remarkable stuff.

SMITH: Amazing. I can't wait to hear.

GEORGE: Emery, thanks. I really appreciate you being on "Cosmic Disclosure."

SMITH: George, thanks for having me again. I really appreciate it.

GEORGE: Thank you for watching.

Disinformation Tactics Season 12, Episode 2

Cosmic Disclosure; Disinformation Tactics Season 12, Episode 2

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host George Noory, and I'm here with Emery Smith. Disinformation--it's used daily with the public, but also within secret programs. Emery, welcome back.
EMERY SMITH: Thanks for having me, George.
GEORGE: I mean, these disinformation programs--specifically, what are they?
SMITH: A disinformation program is run constantly all the time through the military, in the public's eye, and also in compartmentalized projects, especially when it has to do with intelligence, and things that are trying to hide from other compartments. So one of the first times I was ever introduced to disinformation--it was actually told to me that all of the beings that I worked on--about 3% of them will be fake. And that I will not know what is and what isn't. And I'm not allowed to ask that either, if this is a fake one. And that's just thrown in there to see if you're going to be keeping your mouth shut and to monitor other people that are in the projects to see. You might come and look at a craft, let's say. And they might put something on the craft that doesn't fit in just right, just to see how you're going to react to it with everyone. Even though you're not part of that exact piece of craft, just to see the response, to listen to you at the cafeteria, to listen to you on your phone calls and things like this. So disinformation is actually part of the contract that you sign when you're down in there, that you're not getting disinformation, but you will be exposed to it.
GEORGE: Do they ever try to correct it?
SMITH: Well, not so much correct it. They don't ever tell you what they did. A good example of this is--this happens a lot and I've heard it not only through myself, but many of my colleagues working in this underground facility, where you'll see a being maybe 10 meters away or a little bit more, where it's just out of--
GEORGE: Just far enough--
SMITH: Just far enough.
GEORGE: --away, right?
SMITH: Like two security guards walking a reptilian-looking creature through the hallway and making it very obvious.
GEORGE: It could be somebody in a costume to trick you?
SMITH: Right. Exactly. And this is just in case. If you do defect when you get out, or you do things like this, that people aren't going to believe you. They want you to seem a little kooky. They want to see if you're going to take this route, and make a book about it, and explain what you saw, and if you're going to share that information with other countries, and agencies, and things like this. Because you're always followed when you get out of these projects for about 25, 30 years. And you do get visits every now and then, just to let you know that they are watching, and that you haven't messed up too much. And I never say anything that's going to endanger the public, or

myself, or you, for instance, or the organizations that I work with right now. A lot of the stuff that I talk about, believe it or not, it's kind of old school, old knowledge from the late '80s and early '90s. So they're more upset about me talking about ways to cure yourself or ways to create free energy, than me talking about extraterrestrials whatsoever.
GEORGE: Are these disinformation programs also aimed at the public?
SMITH: Absolutely. A lot of the things--like for instance, the Roswell crash. The Roswell crash was a great example of that. First, you had the honest to God truth come out about all the documentation and then following up, oh, weather balloon. All these things are there to mislead the public.
GEORGE: They're dummies, right? Dummies.
SMITH: Yeah. And that's what it's--there's people actually hired on these specific, compartmentalized projects to write things up and to leave files around to see if you're going to go open it, and look at it, or look it up on the computer, and read something that's actually completely fake.
GEORGE: Why do they have these disinformation programs? Is it primarily to distort the fact from the truth?
SMITH: Not necessarily. Most of the time it's for intelligence and security of the people, all the employees, and everyone working for them.
GEORGE: They don't trust anyone.
SMITH: They don't--no one trusts no one. So they do that as far as keeping everyone in check. And at the same time, a lot of these stories actually leak out to the media or to the public by choice. They allow this stuff to slip out. They allow this person to have this file. And then this person five years later releases it to someone else. And then they make it into a world known, because it has the seal of the United States Army on it.
GEORGE: Right. Of course.
SMITH: And I hate to say that. But there's a lot of paperwork out there that I know my colleagues have had in the past--may or may not be real. It's really hard to decipher what is and what isn't. Because it might be a real document with a seal on it, but it might not be the real letter. It might be a staged event.
GEORGE: Gosh, they go to all this extreme?
SMITH: Yes.
GEORGE: Who comes up with these programs? Who develops these?
SMITH: Well, they have actually organizations that are specifically hired and contracted out to write storylines and think way ahead into the future, George. Not just like, oh, well, we want this message to go out next month. I'm talking 5, 10, 15, 20 years, that they have just an amazing amount of disinformation ready to be distributed, not only amongst the military itself, amongst their commanders, but to the general public as well.
GEORGE: Is it propaganda?
SMITH: Well, it is propaganda in a way, because a lot of these things--maybe they need to fight an unknown terrorist to make money for a lot of these organizations. Or

maybe they need to go to war for something. Or maybe they need to plan on a fake space invasion, or an asteroid may be coming. So we need money to go up there and build these special satellites with missiles on them, let's say, when we already have all that stuff up there. It's just a way to shift the general public's attention, because there's really something really serious going on down here. And we don't want no one to know about that.
GEORGE: Would you call that today's fake news--this disinformation?
SMITH: Yeah. I mean, this is definitely the fake news of the planet. It's not just here. It's all over. I mean, look what happened with The Disclosure Project. And a few months later, they take the towers down. So it's a shift of, whoa, we can't have the astronauts on this world press, the world's largest watch--press movement talking about this stuff, because now we're going to have to answer to this. So let's get the timeline up on this other project and get everyone shifted into being Americans and saving the world against terrorists. So it's all this shifting of your attention to something that's really, really important. The world's biggest story is going on, but we don't want you to know about that just yet.
GEORGE: It's like the sleight of hand, isn't it?
SMITH: Absolutely.
GEORGE: Have you been used in these kinds of disinformation programs?
SMITH: I've never been used. My stories that I tell you are exactly how I see them. Exactly how I was involved with these corporations and the government. No one has ever approached me to say this, that, or the other. I mean, I am a solo renegade--
GEORGE: But you've been--
SMITH: --person.
GEORGE: --in these programs?
SMITH: Not the disinformation programs. I worked in programs where they had disinformants there to make sure--
GEORGE: And you knew that?
SMITH: Yes. Yes, I definitely knew that. They even came forward on a couple contracts and said, you will have disinformed information for security and intelligence reasons.
GEORGE: How did you feel about that?
SMITH: It was fine. Because even though I've operated on beings and maybe 3% of them were definitely not what they supposedly were, the rest of the 97% is pretty amazing.
GEORGE: Was there somebody specifically involved with these people that they planted for disinformation? One would call them handlers, for example?
SMITH: Not that I'm aware of. I never was assigned a person to watch over me. I have, right now, scientific advisors, and military advisors, and instructors that I worked with a long time ago that are still my friends. And I just have the utmost respect for them. And they kind of say, hey, Emery, maybe you shouldn't talk about this, or that, or the other. But they're all looking out for my best interest and also my

safety.
GEORGE: Is disinformation healthy and important?
SMITH: I don't see a positive thing about this information, unless it has to do with keeping the intelligence of some sort of item that could be used against us. I think that would be the only beneficial thing. Because it's better to be truthful about--to the public, especially, about what's really going on out there. But if you're using it for your own benefit and to dumb down the public, then I think it's like the most horrible thing you could do to a civilization, by suppressing them and holding them up. I mean, look at Tesla and Stubblefield since 1899 and how they were attacked and suppressed. By now, we should already have our flying cars, anti-gravitic devices, and our zero-point energy devices for everyone.
GEORGE: Well, it's almost like we have companies within the programs to develop these kinds of disinformation programs.
SMITH: Well, it's about money, and it's about ego, and it's about control. They want to protect their intellectual properties. They want to protect their secret devices, whether it's aircraft, or a healing device, or whatnot. So these corporations are also--like you said, within them they have disinformation just for the employees, just so no one steps out of line. And it's sad. Because sometimes these employees will get this information, report it to the public, which they didn't really want to happen. They didn't know that was going to happen. And then it sets off a trigger. This is like the ticking time bomb. And then that information gets over to another country. And now, people are hiring people to kill people to get this information--
GEORGE: Geez.
SMITH: --when the information doesn't even exist or the device.
GEORGE: Take this with all due respect, but how do we know you're not a disinformation guy? How do we know that?
SMITH: Well, the only way I can say is to look at me, check all my credentials. I'm the only person that came up here with credentials from the colonels and captains. And I have my DD Form 214. I'm probably one of the only insiders that actually came forward with hundreds of papers, which Gaia has--I've been checked out recently. Michael Salla just did a huge background check on me, which I was really nervous.
GEORGE: And he's very thorough.
SMITH: He was very thorough on me. He flew in from Hawaii--did this--he took me out to dinner. I was really nervous. And I brought all my paperwork. And he wasn't even prepared for that. And he's taking pictures of every certificate I have. And he went beyond that. And once he left, he actually went to Stanford University and went to Harvard University--contacted the physicians there that I had helped develop a lot of my patents with and stuff. And these people all spoke very highly of me. They said, yeah, this is the real Emery Smith. He did develop these devices--was part of all these medical testings of curing these things and those things. And then he was also investigated at Kirtland Air Force Base and other military installations. And all my commanders have given me the highest regards. And so he wrote a big paper on that, which that helps the public understand.

GEORGE: Absolutely. That makes them comfortable.
SMITH: I'm going to tell the public. As I'm talking to you, you really can't believe anything anyone says. You can't believe anything you read. You can't believe anything you see. And I know this because I know the satellites that can project something right here with a shadow and reflect light. And you will honest to God think that's real, because we use our senses.
GEORGE: Right. You have in the past said that there was information that you were authorized to disclose. Who gave you that permission?
SMITH: Well, I'm still--
GEORGE: Can you tell us?
SMITH: I was under NDAs with corporations, not the military. The military--I just knew what I could and could not say for an amount of time. So no one actually called. I just waited a good 20 years for this to go by. And I know what I can and cannot say. And in time, there's going to be more and more information. I'm still here talking to you guys every week, trying to get this information out, trying to educate the public that there's a lot going on that can help the world and clean up the planet. And that's my main goal. I'm not here for anything else, but actually to clean up the planet, and try to get the beat on all these diseases around the world, and stop the hunger, and stop all the killing. Because we're not going to get anywhere. And the planet's getting really upset with us. So my main goal is not about telling the world, oh, well, there's these secret bases and ETs exist. Yeah, that's true. I think everyone already knows that.
GEORGE: That's out there.
SMITH: But that has to do with the technologies they are suppressing that we need to help each other and help the world. Because if we had all these technologies, we wouldn't need gas, coal, and oil. We wouldn't be fighting each other. We'd be more as a conscious collective trying to help the planet and help each other. And that's where I'm trying to shift this, just in education alone.
GEORGE: But who authorized you to disclose this?
SMITH: There is no authorization for me.
GEORGE: No individual from above?
SMITH: No individual ever came to me. I just knew what I could and could not say since day one and I'm doing it. There was never a phone call from a corporation that says, oh, well, you can do this. I never had a call from my ex-commander saying da, da, da, da, da.
GEORGE: But what if you said the wrong thing? Who would come down on you?
SMITH: I would not know. But you guys would know, because I'd be dead.
GEORGE: It could be that serious?
SMITH: Oh, absolutely.
GEORGE: If you said the wrong thing?
SMITH: Well, if I said the wrong thing and maybe slipped up a couple times, I'll get a slap on the hand. And who's slapping me on the hand? Well, they might take a family member's life, my best friend's life, maybe my dog, just as a little message. So these

threats are real. And I was working on some things. And maybe I was saying some things I shouldn't have been, not on TV, by the way. Just on the phone with other colleagues. And they sure did come down on me.
GEORGE: Do you know who they might be?
SMITH: It's definitely a clandestine, major corporation that has intellectual property I might be affecting.
GEORGE: It sounds like you know who they are and for obvious reasons, you can't disclose.
SMITH: They're a very large entity, and it's made up of major corporations all over. I don't know specifically who they are. But I just know that they're out there because I have been warned. I have had text messages and phone calls.
GEORGE: They mean business.
SMITH: And things were--they're calling me up. I mean, one time they drove by my house in a white van. The two guys in tactical outfits got out, waved their MP5s at me and just pointed at me. And then I knew I might have did something, or said something to someone I shouldn't have.
GEORGE: Were they wearing masks or anything like that?
SMITH: Oh, yes. Absolutely.
GEORGE: Oh, they were?
SMITH: Yes.
GEORGE: Just wanted you to know that if you stepped outside of the boundaries, they know where you live.
SMITH: Oh, they do. There's no hiding from any of these. You cannot hide from these things.
GEORGE: Emery, on previous "Cosmic Disclosure" shows, you've talked a lot about ETs and what's happening there. Are they trying to give us disinformation about the extraterrestrial presence? Are they trying to hide that?
SMITH: They're not trying to give disinformation so much as not giving the information of their existence. All the countries have released all their documents for UFOs, but no one talks about it. Only in the United States of America--have not yet released everything. I wonder why.
GEORGE: Because there's too many good things to release, right?
SMITH: Well, that's why we need everyone to go out and find out for themselves. Don't believe in what I'm saying. I'm not here to convince anybody of all the stuff I've been through. I'm here to expose a couple of things, so we can work together in a scientific community, to develop these things without the government and get it out to the world to help heal the world.
GEORGE: What about false flag programs tied into ETs and things like that? Have they set us up with different kinds of false flags?
SMITH: Well, I think by looking online at a lot of certain other countries. Or it could be our country writing a paper--writing a letter in Bolivia saying--or showing a video of an extraterrestrial tied up and being interviewed. These are disinformation

campaigns. They would not really allow that to happen. Or it would be taken off within the first hour of it being downloaded.
GEORGE: And they're great campaigns. They are successful doing what they're doing.
SMITH: Sure. I mean, it's exciting news to see something like that. It's intriguing. And it affects the general population into what they believe in. The best way to do it is in broad daylight by just making a movie and giving you that idea these things got 10 tentacles. And they're going to come lay an egg in your sinus cavity. So that's been going on since day one, and that's the easiest, best way. It's right in front of you--the disinformation. All the stuff that they're doing to try to control us is right in front of you. And they do it through the media. They do it through movies. They do it through TV shows. But the good thing is a lot of people know that. And a lot of people--it actually opens you up a little bit more, too, in accepting different races and different people from around the universe if something were to come out. But the bad thing is to say that this is going to be a very evil agenda they know.
GEORGE: How does the public know the difference between the real thing and the false thing, where it looks authentic or maybe it's not? How do we know this?
SMITH: That is the most difficult thing to decipher. Usually when a really authentic video comes out and they didn't catch it in time, it'll be chased by a bunch of other fake videos that they'll disinform the public about or showing a similarity to this specific video. And that's what throws everyone off. Because then you're saying, oh, well, these five are already proven fake. So this one must be fake. It's so similar.
GEORGE: But it's the real one, probably.
SMITH: And it's the real thing going on. And this happens a lot all around the world, usually in other countries, because they can get it uploaded faster than we can here in the US without it being taken off.
GEORGE: What has technology done to disinformation? Because now, you can do incredible things with video editing, with audio editing, with computer graphics. You can do all kinds of things to distort people.
SMITH: Exactly. How can you trust any video where I could take a picture with a friend of mine and make it look like you? Or have a video shot where it looks like you and I were having dinner somewhere and talking and verbalizing secrets--
GEORGE: And even putting words into our mouth.
SMITH: Exactly. So it's gone to a whole linear effect of negativity, because you can't trust anything anymore. It's really hard to do that. And the best thing is getting people behind it--witnesses that can come public and say, yes, this is what happened. I took this video. Here's all the people around me. For instance, on one of my CE-5s there was a light being in front of me--a very small being. One of the most world-famous civilian pictures that I took. And luckily, there was people there. So when I took everyone's name down, just to make sure we have the proper authorization to show something like this and say, hey, it's not me shooting a video, or a picture saying, oh, well, I saw it.

GEORGE: Exactly.
SMITH: Well, I wasn't the only one who saw it. There was other witnesses. So when these massive events happen around the planet in Mexico City, over Washington, DC, and it gets filmed, and there's a mass group of individuals looking at this, I think that really helps tell the public, OK, well, even if 90% of all these or 95% or 99% of all these videos on YouTube are fakes, even if 1% is real, it's pretty amazing stuff. So I think the public really needs to decipher that on their own, and doing their own investigations, and looking at these technologies, because you can fake anything now.
GEORGE: The late Roger Leir was an expert in alien or some kind of implant removal from people. He was convinced that the implants were of some extraterrestrial measures put in people for tracking and other reasons. Have you looked at the alien implant phenomenon?
SMITH: I don't get into the alien implant phenomena. I have removed a lot of debris and things. A lot of people have metal in their body. I don't know how they really got there, which they do give off energy and frequency.
GEORGE: So you're saying those could be natural?
SMITH: I think they are natural phenomena. But I can't say that I've done more than just over a few hundred of these procedures. But I've never seen anything that would relate to it of someone placing it now into the body, or another being, or it being actually put into the body.
GEORGE: You don't think it could be done by governments to track people or--
SMITH: Absolutely.
GEORGE: --do something? That's a possibility.
SMITH: That can definitely be done. They have a higher type of technology for that, though. Scars are different. If you see very odd scars on the body that don't make sense, they've been inoculated.
GEORGE: And they're kind of welt looking, right?
SMITH: Not that they have a welt, but an actual scar, or a bruise or something that doesn't look--that's in a specific shape, let's say. These people have been inoculated. I mean, they can get inoculated just walking.
GEORGE: Really?
SMITH: Amazing things.
GEORGE: Do they have to brush against you?
SMITH: They could just brush against you. You wouldn't even know it.
GEORGE: Like a bump?
SMITH: There's just a bump. And this has happened to myself and my team just this past six months. And I was contaminated at the airport in Denver.
GEORGE: Did you get sick there?
SMITH: I didn't get sick, but I did have to take very serious precautionary methods through some special physicians to help get this stuff out of my body.
GEORGE: How did they get it into you?
SMITH: They bumped into me. Three guys in sweatshirts bumped into me.
GEORGE: Three different bumps?

SMITH: Oh, yeah, three different bumps. I don't think they got me the first two times. But I didn't think about it, because it was really crowded.
GEORGE: At the airport?
SMITH: Right. And it wasn't till a couple of my close friends when I was in my T-shirt said, hey, what's that weird circle with a dot in the middle--
GEORGE: On your arm or something?
SMITH: --and with 10 dots around it? Yeah, I have pictures of it. And it showed this inoculation. And I know what that was. And I was like, oh, they got me.
GEORGE: Did you feel it?
SMITH: No, did not feel it. It happened so fast that--and it's done with such a very small device. The imprint is about the size of a dime with a--
GEORGE: And what would the intent be, Emery, of doing this to you?
SMITH: I believe it was just for tracking, because I've been going a lot off the grid lately and not carrying my phone with me. And it gets them nervous. I don't think they were trying to kill me or anything, but the existence of these--these nanomites were proven and detected. So I had to go through a little bit of a special detox-type program that we have. And it was all fixed within about 48 hours.
GEORGE: They've appeared at your doorstep. They've appeared at airports threatening you. Why do they continue to let you say what you say?
SMITH: I'm not saying anything that someone else actually may or may not have leaked out, even though the public doesn't know about it. They are not really worried about me talking about extraterrestrials, talking about my experience in underground facilities. They are upset about me moving forward, talking about future technologies before it's the right time, which I can understand a little bit. Because a lot of these technologies could be used not for the betterment of mankind, so we have to be very safe. But I still need to educate people about that. Yeah, we have these answers, OK? And they're trying to be slow on releasing. They don't want the iPhone 20 out right now. They want it to slowly release these cures and release these devices and the information. But since I've come forward, there's been 15, 20 different devices that have come out since November, because I just slipped a little bit about the information about it. And the corporations now are all over the IPs trying to get these things out. So they're listening to these shows. And they're listening to what I'm saying. And they're kind of sick of it, too, because they have someone over them, making sure this doesn't happen. But when someone like me comes along and starts talking about it, well, then they have to do something. And they are either going to have to make money off it or completely bury it. And they rather make some money off it and release--say, well, yeah, what he said about this--there's a little bit of truth behind it with science. So they're upset. The attacks are coming at me because, really, it's more about that than it is with the ET stuff. They don't care whether people believe ETs exists or not, because there's no money in talking about ETs.
GEORGE: They're concerned about planetary issues that affect their pocketbook.
SMITH: Exactly.

GEORGE: What keeps pushing you, Emery, to tell the public about disinformation?
SMITH: Well, what drives me is the fact that I was involved with technologies that needed to come out. And they're suppressing technologies with disinformation, saying they can't make this technology. Yet, oh, we can't do this yet. That's impossible. Smith--what's he talking about? Zero energy devices. I mean, we're so far away from that, but we're not. We're so more advanced than this. And since I know the truth, I want to expose that truth for these technologies to get out and help clean up the planet, and help cure the world of disease and famine, and get clean, potable water to the world. People are just waiting to have fresh water for God sakes. So it's these things that drive me to come here and sit next to you and educate the world. Because I'm not the only scientist out there that can do this. There's hundreds of thousands of amazing, bright people that have come to me with the most amazing inventions that just blow my mind. But at the same time, they're so--they're scared to come forward, which I understand.
GEORGE: You've got the guts to do it.
SMITH: And I'll do it. I'll speak for you. I'll get up here. Everyone knows. I'm coming out here. And I'm going to represent you guys. And you don't have to do it if you're not comfortable yet. And I've recently--just have a few scientists come forward and some more insiders making preparations for their families to come forward and talk to you and I. So it is affecting people--what we're doing here and talking about it, because it puts it out into the ether. And it makes these scientists feel a little bit more comfortable. And I'm still here. So let's do this. Let's do it together and let's get it out.
GEORGE: I consider you a patriot.
SMITH: Well, thank you.
GEORGE: I was at an event a couple months ago and a couple came up to me. And they said, what do you think of Emery Smith? And I had already interviewed you on "Beyond Belief" on Gaia. And I said, I think he's the real deal. He's got more guts than most humans, because he's putting his neck on the line. At any moment, that neck could be chopped off. But there's nothing that would stop you, is there?
SMITH: They've taken everything from me, George. Everything. I've been shot, stabbed, tortured, kidnapped. I mean, I'm not going anywhere. They know it. So I'm here. And I'm going to keep going as long as I can. And thanks to viewers that you have and that Gaia has and other individuals who stand by me. It motivates me to keep going. And I have nothing to lose anymore. I don't have anything. So I'm here to represent those people that do have the fear, because I have no fear. And I am not stopping.
GEORGE: As you know, Emery, "Cosmic Disclosure" is continuing with special guest hosts and new insiders as well as continuing to tell your story, that very important story. As a regular to the show, do you have more information to tell the world?
SMITH: I have a lot to tell the world, so I'm glad to be here and be able to express the things that have happened to me and the things that are coming for the world.
GEORGE: Quite a hero, my friend. Quite a hero.

SMITH: Thank you.
GEORGE: We here at Gaia are committed to revealing the truth. Please contact us through our private email if you've been involved in these types of secret programs and are ready to tell the truth. I'm George Noory and thank you for watching this episode of "Cosmic Disclosure."

Secrets from the Deep State Season 12, Episode 3

Cosmic Disclosure; Secrets from the Deep State Season 12, Episode 3

DAVID WILCOCK: Welcome back to "Cosmic Disclosure." I'm your host, David Wilcock, and I'm here with Emery Smith and Corey Goode. In this episode, we're going to be talking about the battle between the Cabal versus the Alliance and the enigmatic mystery of QAnon, a weird thing that is appearing on 4chan. Emery, welcome back to the show.

EMERY SMITH: Happy to be here, Dave. Thank you.

DAVID: And Corey, thanks for being here.

COREY GOODE: Thank you.

DAVID: The internet has been extremely captivated since late October 2017 with a phenomenon called QAnon. This is posts that are occurring on the 4chan message board, which is totally anonymous. Corey, why don't you tell us a little bit about what you know about the QAnon phenomenon based on your own most cutting edge briefings?

GOODE: They know exactly who this group is, and--

DAVID: Who's "they," first?

GOODE: Well, the Alliance.

DAVID: OK.

GOODE: The Alliance. This is pretty much a--people don't like the word "propaganda," but that's a military term. It's the information outlet, mouthpiece, of the Alliance. It's one of them. And they're actually delivering operational codes and messages through this 4chan or 8chan website.

DAVID: Operational codes to various factions of the Alliance, to themselves?

GOODE: Right, right.

DAVID: Really?

GOODE: And it's made up of--I'm not going to go into detail, because I don't want to

compromise anyone, but it's made up of a lot of DoD types, mostly retired, who are part of the Alliance. And it comes from people from all sides of the aisle.

DAVID: So it's interesting, because if you dig into the Q stuff, it starts on October 28. And even just within the first few days, there's a very clear blueprint of what we've been prognosticating for many years, which is these mass arrests. So Corey, could you explain a little bit about, how has the mass arrest plan evolved? And what is going on now?

GOODE: Well, there's been a desire for a mass arrest for decades. But as I've stated, the Cabal would basically have to arrest itself. They had people in control of the DoD, all of the branches that you could think of the government, and other governments. This is not just a US thing. According to the latest briefings that I've received, we are finally in a position to where they're going to be able to have mass arrests. But they're debating on how much of it will be public and how much will be done in secret court cases.

DAVID: Emery, are you familiar with the Alliance and a plan to create disclosure by arresting some of the key people that are standing in its way?

SMITH: Yes. I'm aware of many factions of the Alliance. It's not just one group. It's actually multiple, I'll say, groups.

GOODE: And it's a mess trying to get all of them to work together.

SMITH: Right. But they'll have, of course, the very similar goal. And it's to disclose and get all this out. So just through what I've heard recently through contacts and stuff is that they are planning this mass Judicial Court on all these people. And I don't know when. I've no idea about time. But it is the main focus on their pyramid of things to do.

GOODE: And also, I believe QAnon is going to be a part of the data dumps that we talked about as far back as 2015. In 2015, '16, we're talking about data dumps occurring, how they weren't going to do it all at once. They're going to do it in pieces, and then it was going to turn into a data dump war between the Cabal--because the Alliance, the people involved in the Alliance are not angels by any means. So we're going to see a little tit-for-tat document dump war going on.

DAVID: So the excitement factor on the internet about this is huge, because we also have--some people have said up to 13,000 sealed indictments. And so Corey, as those indictments get unsealed, what are we going to be seeing? Who are these--why would you seal indictments, first of all? And what happens as they become unsealed?

GOODE: They will seal an indictment so that the details of the indictment do not get

out to the actors, cohorts, or people that are helping them. So the best way to wipe out an organization is to start indicting them one by one but keep the indictments secret so that the details don't get out.

DAVID: Well, if there's normally only 1,000 or 2,000 of them a year, and we're now looking at 13,000 searchable on public government databases, this would imply it's a very massive operation.

GOODE: Mmm.

DAVID: And the thing that I guess a lot of people have been asking us--and we've gotten this question so many times--is, are we going to see any of this? Because people are worried about that part that you've just said, and they don't want it to all be covert. So is there going to be some of it, at least, that is visible?

GOODE: Yes. There is going to be a good deal of it that's visible. But the crimes against humanity--the charges will turn into corruption. There's going to be a little skewing of some of the things to prevent people from being extremely upset and agitated, because there are some horrible things that are going to come out. But they want it to come out slowly. A lot of the human trafficking and crimes against humanity, people are just going to refuse to believe. So they're going to have to release information. But they want to do it in a slow, protracted way, holding our hands like we're little children.

DAVID: Right.

GOODE: But the Earth Alliance has been working in making deals with the Cabal, helping them negotiate their surrender, basically. And part of that is that they don't think that we can handle the truth. Not all at once, anyway. We'll choke on the pill.

DAVID: Well, Corey this is a great time to bring up one of our questions from you, the viewers. And that is, we did have a question about the QAnon. And the questioner was asking, will we get secret space program disclosure through this QAnon process that's taking place on the internet now?

GOODE: I think we might get little bits and pieces of information. Like, recently, QAnon mentioned the SpaceX mission that was delivering--supposedly, the payload was lost. But a lot of times, that's what the--

SMITH: It was not lost.

GOODE: Yeah. That's what the programs do. They'll send something up, say it was lost, whether it be a satellite to Mars or a satellite around the Earth. And then they'll put it into theater. What I'm told this one was, and it was alluded to by QAnon, was

that this was an EMP device that not just does an EMP but does a sustained EMP from geostationary orbit. And they were planning on using that in a North Korean conflict, which is also what has been described--the MIC has been trying to figure out how to disclose some of their technology. And some of them have stated that this would be a position of strength to disclose this technology--a war on North Korea, that is.

DAVID: Well, now, let's bring that up for a second, because we have had a lot of people on the internet--I get a lot of these emails and comments where they're very upset about, basically, any military show of force whatsoever. Like, they would just prefer not to have anything happen. And so they're worried about the idea that an attack on North Korea is unprovoked. And yet what I am thinking of here is they look pretty darn provocative to me. They're constantly saying they want to nuke America.

GOODE: Yeah, within the next month or two, they'll have the ability to deliver a nuclear warhead back through the atmosphere, have it survive the atmosphere.

DAVID: Well, some people would say that's just propaganda and they're just a little backwoods country and they couldn't ever do that.

GOODE: Well, they couldn't ever do that unless they had all the help from the Cabal.

SMITH: Right. Thank you.

GOODE: A lot of material and scientific support has been provided to North Korea not only through China, but through the Cabal, who has basically just been giving them the plans to a lot of our technology. If you cut out the R&D process of creating new technologies, that's where most of the cost is. That's why China and some of these other countries that have gotten the blueprints after we did all the work have been able to spend a little bit of time and money and make it even better, make the technology better.

DAVID: Emery, what are you aware of the relationship being between a country like North Korea and what we're calling the Cabal?

SMITH: They're funding it. They're funding North Korea. And I've seen the satellite images that North Korea already has two intercontinental ballistic missiles carrying huge nuclear payloads that are operational. But they're just still telling the story and playing the storyboard out. And nothing is going to get sent up anytime soon that I'm aware of. But that could change at any time. The Cabal is behind this and are funding the entire country.

DAVID: Well, and Emery, I find it kind of interesting that in the 1950s, we had the Korean War, which is North Korea versus South Korea. And the way that was sold to

the American public at the time was that you actually have US versus USSR, and it's a nuclear war--

SMITH: That's what it was.

DAVID: --that's taking place in proxy at Korea.

SMITH: Right.

DAVID: So you're kind of saying that hasn't really changed.

SMITH: No, it has not changed in all these years. And what a horrific war that was.

GOODE: The war's never ended, officially.

SMITH: No. That's why there's a border there right now. They're just taking a little break with each other until someone needs to utilize them to control the world in a different way.

DAVID: Well, OK. You and I grew up, Emery, in the Cold War threat of nuclear holocaust. And we were taught the USSR is this big bad nemesis.

SMITH: Grr.

DAVID: A lot of insiders I've spoken to have had a really different view of what the USSR was. And what would your perspective be on that?

SMITH: Well, I think there's a lot of communication confusion and disinformation. Yes, there was this Cold War going on. And then there was other countries that we had to start worrying about. And we weren't so bad after all. I mean, two countries, America and USSR. Because other countries started coming up with these technologies that we had to worry about and control, because--OK, so let's just hold off on this Cold War for a little bit while we go start all these other little wars and also clean up all these leaders that may be a little thinking abstract of taking over the world.

GOODE: I think most of it's been a show, because for well over 50 years, the Russians and Americans have been cooperating in space and working together and building these space stations and locations off planet together.

SMITH: Yeah, no, like I said, that was just a little disinformation. A lot of things were going on back then that we couldn't know about. And it shows today and in the future, like you just said. We're all working together, and we see there's more threats out there than them. And this is what's going on.

DAVID: I want to bring this up for both of you. And that is, there's very compelling research about the idea that Wall Street financed the Bolshevik Revolution of 1917. Wall Street financed communism. Wall Street financed Lenin. Wall Street financed Trotsky. Wall Street financed Stalin. This is all--

SMITH: Come on. The Rockefellers were selling gas to the Germans and us at the exact same time. And we didn't get a discount.

GOODE: Well, us having this conversation shows how much it's in the consciousness, now, of the public. I mean, if we're talking about this openly, I mean, that gives us a good idea of why the last about nine or 10 months, the Cabal groups have been rushing to all their underground bases, moving all of their family and supplies. One of the most advanced ones is in Brazil, and it is a super advanced base that has all the amenities that the elite would want. And they've been pouring into that thing like ants for almost a year.

SMITH: That's a good place to have it for them. Anything goes.

DAVID: I did hear from Pete Peterson that there's a whole area of Brazil that is basically like an undeclared nation owned by the Cabal.

GOODE: Africa, as well. South Africa, parts of--have been handed over to an off-world group. They don't even belong to us anymore, officially.

DAVID: Emery, we have seen a show recently on History Channel called "Hunting Hitler." And it described an extensive German presence in South America where these investigators were going there and finding corridors underground in South America and Argentina, Brazil that had swastikas on them and a whole resort that's got a swastika pool, like this giant swastika in the middle of a big swimming pool. Did you ever come into contact with that sort of information?

SMITH: Yes, yes. They were very busy beavers back then, the Germans. And they were setting up these places all around the world, not just there, either. But it doesn't surprise me, exactly what you just said. And people are stumbling upon these small and large bases that the Germans built a long time ago and just dumped lots of lots of money and many, many personnel for this to happen and hiring locals in these third world regions to help do it and then killing them. So a lot of bad things are happening, karmatically with those bases being built or these underground cities that have been abandoned.

DAVID: When you were in the programs, did you get any specific information about the relationship between Germany and the secret space program or advanced technology, extraterrestrials, et cetera?

SMITH: Not while on the program, no.

DAVID: So that was not something that they ever shared with you.

SMITH: No.

DAVID: Interesting.

SMITH: No, I learned all about that after.

DAVID: But you have mentioned, however, a very enigmatic experience that you had that confirmed something I'd heard, and that is some crashed underground UFOs. So one of them is in this area of South America. In light of these different crashes, could you talk specifically about the Ecuador and Costa Rica? And I want to hear what Corey has to say as you bring that up.

SMITH: I recently was at two sites that had a crashed extraterrestrial craft that went through the crust of the Earth or was transdimensionally going through the Earth and got stuck and crashed in a large cavern. And there's two of them, actually. There's one in Costa Rica, and there's one in Ecuador. And upon getting to this area and getting down into this hole and walking a few hundred feet is this craft, completely intact and operational, to an extent.

DAVID: What did it look like, if you can--what did you see?

SMITH: It was a disc type, and more oval, more egg shaped, but a disk. So smush an egg, and that's what you have. And it has all this beautiful flora and fauna growing around it, all bioluminescent. Even the ground is different. Feels like you're walking on memory foam.

DAVID: In the cave.

SMITH: In the cave where there's no light at all. And all of this stuff is emanating a very interesting glow but not like a beam of light at all.

GOODE: Right. A bioluminescent glow. Yeah, that barely lights--

SMITH: Barely. But that much, you could actually see some things. And even the animals down there were a little different. I mean, I remember seeing these naked mole, shrews-type beings that were just scurrying around. And they were glowing.

GOODE: They'd been eating the--

SMITH: Right.

GOODE: Right.

DAVID: [LAUGHS]

SMITH: They were genetically changing.

GOODE: From consuming the--

SMITH: The plants and being around the craft. And they kept this a very clean area, which I was very proud of them, for a very long time. And what else can I tell you?

DAVID: Well, if you could tell us, what would you see on the surface? How do you get in? Is there an outpost? Is there a little building?

SMITH: Well, it's actually very deep in the jungle. And you have to take just a regular four-by-four there. Nothing special. There's no cool jets or spacecraft taking you there or maglev tubes. That's for sure. It's in a very inhospitable area. And once you get there, it's about maybe 20 miles from the nearest, let's say, village or city. So it's not inhabited in this area. It's actually a protected area. So the government there has set up a very nice, effective, amazing perimeter. It's very unlikely anything alive could get through the perimeter. And they have two satellites just for that area that monitor it. And they have, of course, the Costa Rican military in conjunction with the United States military there. But the United States does not have any ownership or is allowed to really be there to take the craft, which is, I found, very interesting. I think the reason the US government offered the military security there is just so they could keep an eye on things.

DAVID: Well, now, you said Costa Rican military. Does the Costa Rican military handle both Ecuador and Costa Rica in this case?

SMITH: No.

DAVID: Or does the Ecaudorian military handle Ecuador?

SMITH: No, it's completely separate. And the one in Ecuador actually, I think, is controlled by--it could be controlled by the Cabal. But it looks like a civilian corporation which pays the military presence there to operate.

DAVID: So you go through the jungle. You drive all these miles.

SMITH: Right. Then you hike about a mile. And then they have a small station set up there--near it, not at the entrance. And it looks like a hole in the ground about 25 feet in diameter and full of just plants and everything.

GOODE: Like a cenote, kind of a cenote-looking--

SMITH: Yes, yes.

GOODE: --sunken down area?

SMITH: Right, sunken down like a sinkhole in the ground. And there's so much flora and fauna around this that it's never been cleared, because they're letting it grow. And if you go down in it and you get past the--

DAVID: You walk in, or you drive in, or--

SMITH: Well, you walk. Actually, it's on a 45-degree angle for about 25 feet. And then there's a small ladder-type thing that goes down halfway to another little area. But mostly, everyone--they have these big conveyors with these pallets. It's very generic, but it's very strong. That's going to happen. That lowers you and raises you up, and it could fit four people on there with gear. So they lower you down. And then it's very close to the surface.

DAVID: Wow.

SMITH: And then once you get past the area where the light starts to diminish, maybe 100 feet or so, then you notice that the ground looks different. And it's glistening. And then it gets really moist. The humidity is even more what it is, which is 100% humidity at the top. So you get down there. So you do have this glowing mist, fog, that's all over the place. But it's not spooky, like you see in Halloween and in the "Thriller" video. It's just a small--you can see through the mist is what I'm saying, the cloud. And it stays about within a foot of the ground. And once you get up in there, then you might see some animals. You might see some bats. And you might see some other creatures that we have on Earth. But they all look very different. They are different color. They're iridescent, and they glow. And they're actually friendly.

DAVID: What was the size of the craft compared to the overall size of the cave?

SMITH: The cave was not too large. It was maybe 75, 80 feet at its largest width down to the smallest width is around 35 feet. And then the entrance is around 20, 25 feet. So it varies in a type of cone shape, where it gets larger and smaller, larger and smaller.

DAVID: If there are caves like this that would have these weird animals and plants in them and you could just walk into it, then why haven't they appeared other places that people have found and documented in scientific journals?

SMITH: Right. This is the interesting thing. This craft is somehow emanating some

sort of atmosphere inside the cave where these beings do not want to leave past a certain sphere of energy, which they measure to be about 120 feet. So it's just putting that energy right up to almost the entrance of this cavern, within 50 to 80 feet.

DAVID: Wow.

SMITH: So what is going on is because of this field of energy that they're measuring that is upregulating all the cells of all the plants and all the animals in a very--they're all very healthy, too. And they're growing. The plants that are there are native to the actual cave. But the plants are out of that energetic field are a lot smaller, and they don't have the same nutrient factor at all. And even the animals there are showing now, through testing--which I just recently found out that I couldn't share earlier, was that they are very healthy, too. And they have even longer nails and longer hair, and they're a little bit larger than the normal species of animals that are usually located in this part of the cave, including the insects and the worms and the amphibians that make it down there. So it's a very dynamic ecosystem that this craft has created because of the energy that it emits.

DAVID: What is the difference, then, between the Ecuador site and the Costa Rica site? Is it the same kind of squashed egg-shaped craft?

SMITH: Yes, it's very similar. The craft is a little bit different. But for the sake of explaining it, it really has the same effect on the animals and the mammals and amphibians that are in there and the plant life. And it looks like two. I think they took some sort of way to--they were measuring how long it's been there. And one of them is actually a little bit more recent than the other. So these craft have definitely recently crashed there in the last 30 to 40 years.

DAVID: Oh, wow.

SMITH: And maybe even more recent. And archaeologists are finding all through South America and Central America all the way down to Peru. They're starting to go through these caves systems, now, looking for crafts--

DAVID: [LAUGHS]

SMITH: --and looking for different species. Because it's getting out in the village and the local population down there that these things exist. And now, you have the birth of these treasure hunters and pirates and these people that are smuggling a lot of this stuff out. So I was just informed down in Peru that this is happening, that they're pillaging some of this stuff. They're getting in past the security. And the security is actually part of this group of pirates and these people. The government hasn't taken over that one yet.

DAVID: That is really interesting, because this other insider that I've called Bruce had said that there was a lot of amazement about the similarities between what is in the Antarctica and what was in Ecuador.

SMITH: Right. And that's why they are in control of this site, too.

DAVID: Really?

SMITH: So I'm interested to see--number one, physically see and record and bring something back to the public of what's going on there. We even have satellites that we're chartering for this mission and everything so they can follow us and people will be able to follow us and kind of make it public what we're doing and see us. So that's another aspect to this is safety. And the safety thing is putting us on hold for a little bit.

DAVID: What's the safety concern, exactly?

SMITH: Well, anytime you bring in an outside group--and of course, they know we're filming--it's going to be limited to what we can see if I just went down there with a team.

DAVID: Right.

SMITH: So as a listener, I would rather have some photographic evidence or some video rather than listen to someone just tell a story about it. Because it's nice to have some tangible things. And I'm also working with the Ecuadorian, Costa Rican scientific team into maybe possibly getting something out of that cave to bring back, which is very difficult to do, because of customs and everything else. It's not like we're in the projects anymore, where you're in charge of billion dollar equipment and transportation and can do pretty much anything you want to sign off on, get the boss to sign off on.

DAVID: Corey, if we're seeing, like on "Hunting Hitler," these Germans making pretty elaborate underground and above ground stations in South America, do you think they might found something there that was interesting for them?

GOODE: Absolutely. They've found craft, like he's discussed, that--I mean, there are a large number of craft that are fairly ancient that have crashed on Earth and are under the ground. So they've discovered those types of things. They've discovered ancient pre-Adamite bases or deep underground facilities that have been long since abandoned. And they found how to travel through the rift system that goes from North America all the way down to Antarctica that's very deep. It's a rift system that is filled with water that they travel up and down in electromagnetic propulsed submarines that are huge. They're the size of a container ship. They carry containers inside of them. I

saw them unloading from one of these submarines.

DAVID: Does that sound familiar to you?

SMITH: Yes, yes. I know about--because it goes under Nazca, Peru, there, and they stumbled upon that accidentally using some sort of radar or something. And there are these large [LAUGHS] submarines using this aquifer rift highway, I'll say.

GOODE: It's huge.

SMITH: And it does. It goes all the way down south to Antarctica.

DAVID: Well, Emery, in light of what Corey was saying with crashed UFOs being found there, what information do you have specifically about such crashed craft?

SMITH: Well, there's a couple of different places on the planet that I'm aware of, like Costa Rica, Ecuador, Antarctica, and now I was just informed of, in Peru, one that I'm scheduled to investigate in a couple of months.

GOODE: Yeah, I've heard about that for--I've heard about it for a while.

SMITH: Right.

GOODE: Yeah.

SMITH: There's a little war going on of who's going to own that, the three tunnels that actually go to it. But what they didn't realize, it's a huge tunneling system that goes all the way to South America through the rock, though, not the aquifer. And that's a whole other thing. That's part of a more older ancient way of travel, these giant lava tubes that go all over the place from--that pass through Nazca, Peru, where the giant craft is underground. And people are coming out of the walls in suspended animation and many, many, many artifacts.

GOODE: Yeah. And in Antarctica, they have a spaceport that was originally built by the Nazis. But then it was handed over to the ICC later on as a part of some of the deals that they made. And it's one of the main MIC, SSP ports right now. There's also one that I was told was in Brazil, but I haven't heard any details other than that.

DAVID: Interesting. Well, Corey, why do you think right now that there's this mass exodus of Cabal people going to these various underground and off-planet facilities?

GOODE: Well, we're on a different timeline than the one that they had been hoping for. We are in a timeline, now, of all of this stuff being revealed. All of the horrible things that they've done, the crimes against humanity, are going to be revealed. And

they're on the run. They know that the FEMA camps they built are now where they're going to reside. So they think that they can go underground, close the lid, and live out their lives until things go chaotic on the surface and then come back and take over.

DAVID: Some people would feel like we shouldn't allow them to, quote unquote, "run away," that if they leave or go to these places, we'll never see them again. We'll never be able to get them.

GOODE: Mm. Some people think they're paying for their own prison. But the technology that we have, there is nowhere on the earth that they can hide.

DAVID: What about the solar system?

GOODE: The solar system, there's nowhere they can hide. If these people found a way to get into restricted areas that are now controlled by the Alliance that gave them access to the portal system, they may make it through the portal system. But they're going to be on the run for the rest of the lives. They have the ability to track portal travel by the energy resistance output from the portal. They can tell how far you traveled. And they've got it all worked out.

SMITH: They basically, just so you know, also, are not only running from us. But the extraterrestrials beyond the system also are aware of them. And let's just say there's a big reward for bringing them back to us. So they can go nowhere and not be found. I mean, they are honestly not that advanced compared to what we have, as well, and what we are sharing with other civilizations. So we have this upper hand. It's just we're not using it yet until we get all the facts and have everything put in the right place. But looks like we're right there, because now, they're running, which is a great thing.

GOODE: Yes. We have a few more battles ahead of us, but it is very apparent that we've won the war.

SMITH: Absolutely.

GOODE: Won our freedom.

DAVID: Well, in the Hero's Journey sense, the dragon that the hero has to slay is sitting on this gigantic mound of gold. What is the mound of gold?

SMITH: Well, it's just abundance is what they're trying to, I think, show. Maybe there's something else to that.

DAVID: What would we get once they're defeated?

SMITH: Well, we have abundance. We have free water, food, clothing for everyone around the world. I know that's something normal. We all just dress up here in the US. But we are looking worldwide here, and planet wide, where everything changes.

GOODE: And no more hunger.

SMITH: No more hunger. And just like here on Earth, it affects all the other dimensions and all the other worlds.

DAVID: Wait a minute. You're genocidal. You're trying to set a population bomb. People are going to breed like rats. This is what they say, right, in these programs. They're going to breed and breed, and how dare you let that happen?

GOODE: Well, then we start moving off world.

SMITH: Well, with this technology, and Corey knows this very well, we will. We'll be in space. We'll finally be able to be in space for free.

DAVID: That's what drives me crazy.

GOODE: And we can sustain as many people on the planet as we wanted.

SMITH: Right. It wouldn't take very long, either. There's a lot of these places, too, like on the other planets and the moon. There's already installations and things set up. And to bring people to space once this is disclosed and all the technology comes out and is controlled in a safe manner, it's going to be unlimited of what you want to do and where you want to go. Because you're not going to be worried about working to pay that electric bill tomorrow.

DAVID: I would also just point out that any time you allow a country to develop, they quickly reach zero population growth or even negative population growth, because they don't need to have lots of children in order to survive anymore. So you have workers who are skilled, who might not be as interested in building families anymore, because they're out doing their jobs and stuff.

SMITH: Yeah. They chase their passions now. Everything changes in yourself when you get to do something that you love.

DAVID: And another point is the whole discussion of overpopulation that the Cabal uses as an excuse is a completely manufactured reality, right?

SMITH: Right.

DAVID: Corey, do you feel that's true? I mean, what do you think about the space

facilities? Do we have enough room for a population?

GOODE: We don't need, really, more room. It has to do with sustaining the planet and not using up all the natural resources. And we have the technology to not have to use the natural resources hardly at all--

SMITH: Right.

GOODE: --and have an effect on the biosphere. So we could have twice the people on the planet we do now and have a tenth of the carbon footprint.

SMITH: Right, or the imprint. Right.

DAVID: Well, I had one insider tell me that we could have 20 billion people live in the Amazon River Basin alone with the resources the planet has. A planet like Earth could potentially sustain far more people than we have comfortably. Do you agree with that?

GOODE: Absolutely.

SMITH: And don't forget, too, the technologies that come along with all this free energy and water and whatnot. Also, we get to clean up the oceans, all this trash out there in the Pacific floating around and the oil spills and whatnot. That could be done in two days with this technology.

GOODE: Absolutely.

DAVID: Well, this is really hopeful. And I want to thank both of you for being here. and we thank you for watching.

Interdimensional Light Beings Season 12, Episode 4

Cosmic Disclosure; Interdimensional Light Beings Season 12, Episode 4

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith. Interdimensional beings--are they ghosts? Are they extraterrestrial? What exactly are they? Emery Smith, welcome back.

EMERY SMITH: Thanks, George.

GEORGE: Emery, when we talk about interdimensional beings, what are we talking about?

SMITH: We're talking about a race of beings hundreds of millions of years ahead of us that have already been able to master how to change their form. They are allowed to switch their atoms and photons around to take almost any form they want and travel through time and space. It can go from a light body to a 3D body. It can change its frequency at will to go to another dimension. It can phase in, phase out, bleed in, bleed out of multiple dimensions. That makes it an interdimensional being.

GEORGE: At any time?

SMITH: At any time by its own will.

GEORGE: Are they physical, or are they somewhat ghostlike?

SMITH: Yeah, that's a great question. I get that a lot, because a lot of these sightings and things--people are referring to them as ghosts, or people report ghosts being seen when they're really these interdimensional beings. The interesting science behind this is that when an interdimensional being enters our dimension, he falls under the laws of our three-dimensional reality. So he has to take some sort of form. But don't forget, light is form, too. So that can be visualized by our five senses here on planet Earth, or through our solar system in this universe, in this dimension. So as they come through, they might change from a light being into a form of their choice, or they also could stay in the light form. So many accounts that you've heard in history books and around the planet of these ghostlike sightings--now, some are ghosts. Which means if you were to pass away right now, your photons will still be in that chair for 30 days or more. And so this is what I'm getting at--the photons of the genetic makeup of the DNA is always there. Even when we leave our seats right now and come back tomorrow morning, we're still going to have--our resident energy's still going to be here.

GEORGE: How do these interdimensional beings, Emery, kind of come through to get here?

SMITH: Right, we hear about this bleeding through the dimensions. And how that is because they are allowed to change form--their frequency; sound before form. By changing frequency--and everything's a frequency--our DNA. Everything around us is a frequency of some sort that can be measured scientifically. So they can actually vibrate themselves and change their frequency and disappear right here, and not be seen but still be here in some form. It's kind of like an advanced teletransportation system. Think of it that way.

GEORGE: Are they coming through a gateway or a portal?

SMITH: Nope. They have mastered the ability to vibrate at a frequency for different dimensions. So there might be many dimensions right here right now around us, and because they can change their frequency, they can be in that dimension right now. Remember, there's no time or space. Everywhere in the present is right now, right here. So they're not traveling over millions of light years to get here. We're talking about the higher dimensional beings that are able to do this type of science.

GEORGE: There was an old classic "Twilight Zone" episode called "Little Girl Lost," and it was about a little girl who somehow fell out of her bed into another dimension. Is that kind of like it is?

SMITH: Well, there are areas around the planet and areas that can open up where these energies of the different dimensions sometimes fall within the same frequency and they overlap. And when that happens, these little gateways--these openings to other dimensions--form. Like in the old saying around Halloween and October--"The worlds are at their thinnest." And it allows these ghostlike creatures to come through, and you can visit your family. And there's a lot to that being said with extraterrestrial technology with these interdimensional beings. And it also has to do with different parts of the planet have these openings there all the time. So things can form. They can open up a gateway--especially ET craft--

GEORGE: Sure.

SMITH: --interdimensional craft. And sometimes when they open up a small area, well, that could stay open for a while when a craft comes through it. It might stay there.

GEORGE: What if it closes? What if it closes?

SMITH: Right, what if it closes?

GEORGE: And you're in there?

SMITH: Well, your frequency probably will stay there.

GEORGE: Now, these interdimensional beings--are they biological at all?

SMITH: Well, of course, absolutely. Don't forget--sound, light, and form. But when they come here, they can take a form if they choose to, or they can stay in the light form. It's up to them how they want to frequency vibrate here and how they want to show whoever they're communicating with. Maybe they want to only communicate through sound, and you hear tonalities. The study that we have that we've gone through with other extraterrestrial beings that it's more of a tonality, but they're there. You can't see them, but you can hear them.

GEORGE: A lot of times, Emery, we get stories and reports of these interdimensional beings, but they always seem to be alone. You never seem to hear stories of them coming in pairs, or 10 of them, or 20. Why not?

SMITH: Well, that's not my experience. I mean, a lot of these interdimensional beings have traveled through time and space and have been able to open up right in a fabric of time and space, and you might just see a small ping pong ball of light, and that could be a whole civilization.

GEORGE: Really?

SMITH: Because there is no size when it comes to these interdimensional beings. So you have to think about the physics and science behind that--of how to represent that when we're educating the public--that there is no size to anything when you're talking about interdimensional beings because they are able to shift their atomic structure into light. This has been going on for millions of years on planet Earth, and the way they communicate is like I was just talking about earlier about tonalities and frequencies, and also taking the manifestation form of maybe a human being, and then helping us get more technologies and giving us ideas of how to improve ourselves.

GEORGE: Are we are interacting with them with technology, or is it more consciousness?

SMITH: Well, consciousness is the basis for all communication and for all the science behind interdimensional and multidimensional creatures. However, there are devices that they are working on to spot these people and these beings--

GEORGE: High technology?

SMITH: Very high technology--such as the neutrino light detectors and the satellites

that pick up subtle changes in light. These things allow us to see these beings and see their craft when they're cloaked.

GEORGE: Almost like night vision goggles?

SMITH: A lot better than that, but that's also reverse-engineered from extraterrestrial capture.

GEORGE: Exactly. Are interdimensional beings different from extraterrestrials?

SMITH: Interdimensional beings are extraterrestrials, kind of like we are extraterrestrials in our genetics. So the answer to that is they are one of the most advanced extraterrestrials in our dimension here in our society.

GEORGE: How evolved are they?

SMITH: They're the most evolved. They can change from--

GEORGE: They're at the top of the pole, huh?

SMITH: --physical to light. They can travel anywhere, any time, and any place. So they're very mature, and they're very conscious beings. People who see angels and things like this, I really believe these are the interdimensional beings. We've all been programmed since day one. Many of us growing up in religious families and reading the Bible and reading stories about fairies and angels and trolls and these things. So the best way for us to comprehend this is to--when you don't believe in another race or extraterrestrial, well, when you see something like that, you're going to put it into your own words, and your mind's going to come up with its own vision and its own answer to that. So I think a lot of this is how else am I going to explain this beautiful light being that's in front of me? Well, of course, it's an angel. That's what I learned growing up. If we don't exist, I don't think they're going to exist. A lot of the genetics that we have tested on many beings have a direct relation to our own human DNA. Now, why are beings 10,000, 100,000 years more advanced than us have our DNA in them? Even though they have mutated over millions of years, it's kind of like a hodgepodge, George, of planet Earth. Look at all the races we have, and all the continents.

GEORGE: And the species of animals, and everything else.

SMITH: Yeah, and the species and all of us interacting as humans and flourishing around the Earth and having different types of races intermingle. Well, think of that on a universal scale. Think of--

GEORGE: Oh, that could be just tremendous if you could harness it.

SMITH: And then animal species and the mammal species and the human species intermingling, and then we go amongst the stars in the next 1,000 years and intermingle with other human-like beings.

GEORGE: In the programs you have been in, have there ever been any ways where they've communicated with these interdimensional beings that you know of?

SMITH: Well, I've worked with some extraterrestrials that might have been interdimensional, but they had a form. And a lot of these beings were just communicating the way I communicate with you, but telepathically. And telepathy is a type of communication. It's a type of a language that you have to learn when you're working in these projects with these beings, because telepathy is based off a lot of your frequency and emotional state as a human being. So if I'm really upset and I walk into an operating room and I am assisting a physician and an extraterrestrial and I had a really bad day and I just say, "Hello," it's more like, (GRUFFLY) "Hello." They pick up on the emotion. So you have to really clear your mind and clear your spirit before entering into these projects when you're going to start your day to work, because they pick up on all the stuff. And they are kind of are in your mind, because they have the ability to know everything you already know. So there's no secrets with these beings.

GEORGE: Some people have said that these beings are not benevolent. What do you think about that?

SMITH: It's a possibility. I only know one really evil race of beings, and that's the human race here on the planet Earth, because we kill each other. But I have not been subjected to an evil race of beings yet that I have worked with or I've seen or intermingled. Not to say that there aren't, because if we are, then there's got to be more--

GEORGE: Yeah, some have to be evil.

SMITH: --more of us, yeah. There's always got to be some evil intention out there. But I do believe in a type of galactic federation that does not allow beings that are going to do bad things to go amongst the stars. We've been quarantined to our planet until we get a little bit more conscious and take care of the planet and each other. And then I think we'll be able to go amongst the stars in a conscious effort to work with other extraterrestrials and other societies.

GEORGE: They're told not to come here and annihilate us?

SMITH: Yeah. I think what's going on is they, too, George, were once us, and they had to go through this, too. They had to become more conscious and take care of the planet and take care of each other. As a parent, you would look on your children, and

yeah, you're going to say you did bad, but at same time, you were there once too, so you know there is this learning and this maturity that you have to go through before you get there. Now, I think we were already supposed to be there 100 years ago, but because we have this control factor--there's many planets out there that started around the same time we did, and they're a lot more advanced than we are because they didn't have this control factor of these corporations and people trying to--

GEORGE: Too much greed here.

SMITH: Yes, too much greed got in control of this planet. And we're working through that. And what we do here affects planets all over the place. So getting back to your question is they want us to evolve in a safe and effective way, but they also don't want us to blow up the planet or destroy each other.

GEORGE: Why would these interdimensional beings come here in the first place?

SMITH: They come here because the planet is so diverse and dynamic, unlike other planets, with the water and the air and all the species--down to the bacteria and the phytoplankton and the oceans. So they come here to see this. You have to understand, the Earth has been visited forever and ever and ever.

GEORGE: Of course.

SMITH: Many times.

GEORGE: Of course.

SMITH: So we have a history, Earth, that we have to uphold to. Which, we've been here millions of years, and so the visitations are still coming, they're just coming from a little bit further away, because it's not so safe to come here anymore because we'll blow them out of the sky. And they know this is happening, but they're hoping things are going to change.

GEORGE: Interdimensional beings and plasma beings--are they the same thing?

SMITH: Well, plasma--this is another form, like air and water and gas. Plasma is this fourth state. And it can form into that. It can be part of these beings--a plasma state. But to say that the being is all plasma--no.

GEORGE: That's not the case.

SMITH: No.

GEORGE: How do they interact with each other? Do they?

SMITH: Yes.

GEORGE: Do they have emotion?

SMITH: Yes, absolutely. They have emotion. They're very comical. And just like I'm speaking to you, they just do it through frequencies and tonalities and telepathy. So a lot of the beings that you might see in pop culture--they have really small feet, and they only have a really small mouth. Some of these beings--they don't need a digestive system, because they can form the nutrients just from thin air.

GEORGE: Do they procreate?

SMITH: Yes. Not only do you have little entities, these beings also have pets. They have many different species, like we do here on the Earth, that are used for companionship.

GEORGE: Do they have emotion?

SMITH: Yes, they do. These beings--when you get around someone that's really loving and fun and bubbly, it rubs off on you. When you--

GEORGE: Oh, you can feel it.

SMITH: Go out with your friends.

GEORGE: It's infectious.

SMITH: It's very infectious. They have the ability to make you feel like that instantly--instantaneously--if they wanted to.

GEORGE: Do they ever come through to this dimension where we are, and they look like us, and you would not know the difference?

SMITH: They're walking around the planet right now, and you would not know the difference. I get this question where people are like, well, what's the little quirks they have that you could figure this out?

GEORGE: Yeah, do they have elongated heads, or anything like that?

SMITH: And some of them, I have to admit, maybe their ears are just a little bit different, or maybe it's just something different that you notice that you don't usually see on normal human beings.

GEORGE: Eyes different? A little twinkle in the eye?

SMITH: Eyes might be a little bit different--little bit bigger, little bit further away, little things like that. But it's really impossible just to--unless you've been in these projects and have really studied the morphology of these beings--to really know if--if they were sitting right next to you, you wouldn't know. Or walking through New York streets, you wouldn't know. But working around them, you might catch on a little bit on physical characteristics and quirks like that, but you would have to be around them for a while to pick that up, I think.

GEORGE: Are governments and secret programs, corporations working with them for any specific reason?

SMITH: Well, I know they're working with them in the projects to assist with technologies and engineering and geological things that they need help with. Some have been captured and have decided to stay with us. That being said, I think it's a positive thing to show a species from another planet coming here to help just work with us by volunteering.

GEORGE: Now, when I hear the word interdimensional, Emery, I think of something multiverse. Is that conceivable? Is that what we're talking about?

SMITH: Right. Yeah, multi-dimensional just means there's different dimensions, and interdimensional is the actual going from one place to another.

GEORGE: To another.

SMITH: And the multiverses that you hear about on TV and science is that. It's the different dimensions that are overlying each other right here, right now. And the only way to get there is by changing your frequency.

GEORGE: And the gateways, again, fascinate me--these portals that may be out there.

SMITH: The military builds bases on different ley lines around the planet, and they use these areas because the energy signatures have been shown that these are gateways to other places in the universe.

GEORGE: Places that we want to go, or places that we don't?

SMITH: Well, that's not for me to say. All's I know is there's these portals that are around the planet--and in the oceans--that are protected that they're testing, and they are using these, and craft are coming in and out of these. Not to say there are craft, by the way. But they are monitoring these, and they're trying to reverse-engineer these and duplicate these. And there's lots of--in the classified projects, lots of videos, documentation, and pictures and briefings on how these devices work, but it has to do with the energy of the planet is how they are operational. And also, there's some way

to turn them on and off. Now, there are ancient structures here on the planet that are just always ongoing. What's not to say that we haven't explored--definitely the oceans that much here--that there's other areas that are maybe always on and active that maybe a craft flying over the Bermuda Triangle all of a sudden disappears? It's like--

GEORGE: Who knows?

SMITH: --what's going on, here? So there could be these rifts in time and space that, during certain astrological times of the universe, that these things open up and things go missing.

GEORGE: And close.

SMITH: Right, and close.

GEORGE: And Close. Now, let's tie this back into secret programs. Somewhere along the line, I think, governments are aware of the ability to travel in space through portals or time warps. They know about these entities--these beings. Something else is going on here, don't you think?

SMITH: I think it's limited to a very few governmental agencies, militaries, or even presidents of many countries. I don't think it's a widely known thing. I know, just like we have our compartmentalized projects, military doesn't know what they're doing, but they might be investigating something themselves on a lower--

GEORGE: Sure.

SMITH: The military is usually the security for all these compartmentalized programs. When people are like, oh, Smith was claiming he worked at Sandia Labs and Los Alamos Labs--no, they didn't write my check. I was working underground in that facility where each floor is rented out by a different corporation.

GEORGE: Gosh.

SMITH: So I mean--

GEORGE: How long were you down there?

SMITH: I was in the military for seven years, and I was only in the projects for about four.

GEORGE: Did you stay down there almost 24/7, or--

SMITH: Oh, no. It was a 9:00 to 5:00 job that I would report to.

GEORGE: Oh, so you could come up to the surface and--

SMITH: Yes, yes. There was only a few times that I got locked down there because they had incidents and things were going south for whatever security reasons, and you might have to spend the night there a couple nights until it gets cleared up.

GEORGE: If interdimensional beings are coming here, are we going there?

SMITH: Like I said, because the portal technology that I was exposed to and the time travel stuff, we're definitely traveling somewhere. I don't know where exactly.

GEORGE: You haven't gone.

SMITH: Yeah. I don't know where we're going. Well, I've been through portals and time travel--

GEORGE: But not other dimensions.

SMITH: But not other dimensions that I'm aware of.

GEORGE: Now, what do you mean by that?

SMITH: Well, sometimes you might go somewhere--even just going to work on some of these maglev devices that you hear about in pop culture--sometimes things happen and you end up in a place that doesn't look so natural compared to like it would on Earth.

GEORGE: Will we ever get help from these interdimensional beings?

SMITH: Yes, I really believe that. I believe that if more than half of the Earth's population's going to be compromised--which, one nuclear warhead, it would be--

GEORGE: Absolutely.

SMITH: If a major destruction of the planet because of earthquakes or other things were going to happen where, like I said, more than a third of the Earth would be destroyed, I do believe they would definitely intervene--which they have done on and off in times where volcanoes and earthquakes were going off. People would always see these ships coming in out of the volcanoes when it's happening, because they're trying to neutralize the cataclysmic event. So I think they would definitely intervene if something like that was to happen, and we would definitely get our hands slapped for that.

GEORGE: What would you say to somebody who would say to you, Emery, I woke up last night, and in my room was this being that just appeared and disappeared. What

would you tell them?

SMITH: Welcome to my world. I would ask them--I mean, if they had--this has happened to me, where friends and family and colleagues have called me and don't want to talk about it. Especially for a first-time person to see something like this--you think you're ready for it, and a lot of our CE-5 expeditions, we bring a lot of, sometimes, media with us. And it's funny, because you think you're ready for it, but when you actually see it, it doesn't fit into your reality. But it's there, and you know it's there, and you feel it. I would tell that person, well, what happened? Did it try to communicate? Did you try to communicate? What was the events that happened the night before? Were you meditating, or did you have a close encounter of the fifth kind? What's been going on? So I'd be more interviewing them and trying to find out why this being chose this person to expose itself to, because there's a lot of risk for an ET to expose itself.

GEORGE: What is the fifth kind that you mentioned?

SMITH: A close encounter of the fifth kind is when you reach out and try to communicate with extraterrestrials. The government doesn't want you to do this, because--there's actually an FBI file on me, unfortunately, because I'm contacting extraterrestrials and talking to them. And it's so sad, because what gives anyone the right? And I figured it out. It's a backup plan for the United States government to fake an alien invasion--an extraterrestrial invasion--

GEORGE: Which is Project Blue Beam?

SMITH: Well, I don't know what the pop culture terms are for this. I just know for a fact, 100%, because my FBI people told me this, my CIA people told me this to warn me--that they're making a file of people like you, and when this happens, you're going to be incarcerated, because the story is you brought them here. And this is going to be a fake invasion. You've probably heard this conspiracy theory before. But it's sad to know that after all I've done, my name is actually on there--on an FBI file--saying we got to watch this guy, make sure he's not talking too much with them, but also documenting it. So if they want to pull that card, they can. And no one was even going to know. All the people that are involved with these types of things are aware of this, that do CE-5's. But it's a sad thing to know that I'm a backup plan, I'm a terrorist. They label me as a terrorist because I'm--

GEORGE: They treat you as such.

SMITH: Well, nothing's happened yet, but the fact that there's a big file on this--it is worrisome. But it's ridiculous. It's another one of these let's have the support of the nation to fight this terrorist here who brought these evil aliens here to destroy us.

GEORGE: You've been through a lot of stuff.

SMITH: Yes.

GEORGE: If you were to write an autobiography about your life, how would that last chapter end?

SMITH: I would finish the book by giving my own opinion of what the future's going to look like for us. Our lives are getting easier. We're living longer. Very positive things are happening on the planet.

GEORGE: You're really upbeat.

SMITH: I love it! I'm so thankful to be here at this time and make a difference, because I just see the future, and it's so grandiose, if we could just get our act together. And I believe the cities are going to improve, the pollution's going to go away. We're going to be able to clean up this place, and it's just going to be the most magnificent place in all the universe.

GEORGE: Emery, thanks for being on "Cosmic Disclosure."

SMITH: Thanks, George.

GEORGE: This is "Cosmic Disclosure" with Emery Smith. Thanks for watching.

Jason Rice — A New Insider Season 12, Episode 5

Cosmic Disclosure; Jason Rice — A New Insider Season 12, Episode 5

JAY WEIDNER: Today we have a special guest. His name is Jason Rice, and he claims to have been in the Secret Space Program. Hey, Jason.

JASON RICE: Hello, Jay. Thank you for having me.

JAY: Yeah, it's great to have you. Why are you personally coming forward?

RICE: I'm coming forward now because there are thousands of others out there that have been through this, that have gone on the 20 and Back program. And I'm not just talking about Americans. We're talking globally. And some of the people that did not come back, their stories need to be told. Whether they were soldiers or scientists or just civilians, they provided and gave the ultimate sacrifice for humanity. And their stories need to be told. We need to have full disclosure. The people need to be aware of some of the things that humanity has done. It's time to heal and to grow from that.

JAY: So let's start with the beginning. You had a behavior problem. Because you were constantly being an escape artist.

RICE: I was. I kept getting brought back by the police or strangers. I had my own dog tags--if lost, please call--on a chain. And so the last time that I was brought back by the same police officer, he told my parents that if they didn't keep me contained and keep control of where I was, that I was going to be taken into state custody.

JAY: And this caused your parents to freak out. Because they're afraid of the police and child protection services and all those people coming and investigating them--totally understandable.

RICE: Understandable--of course, they were terrified. And they found a behavioral program at one of the local universities and enrolled me in that.

JAY: What happened there?

RICE: They would give us a command. You know, say--hey, I want you to stay in this chair. Don't get up. And of course, there are toys everywhere in the room, all kinds of interesting distractions. And so of course, I get up. And as soon as I got up, they picked me up, put me in a box, locked the box, and then would wait. And of course I'd scream and holler and yell and kick and thrash. And as soon as I stopped, they would reach in, pull me out, set me on the same chair, and give me an M&M.

JAY: So they were starting to form your personality at that point.

RICE: That's correct.

JAY: And they were using candy and toys to entice you into whatever they wanted you to change--I guess change your behavior. - --to control it. And that program turns out to be one of the recruiting arms for the MILAB program. And that's where I was identified as an intuitive empath.

JAY: When you say intuitive empath, what do you mean?

RICE: An intuitive empath is somebody that feels or knows something without having been told, without having experienced it before. It's an ability to pick up on emotions. It's not mind reading. But it's being able to feel what others are feeling and being able to intuit why they're feeling that way or how something is supposed to work or how it's supposed to go together. People have termed or called it psychic, but it's not really the same thing.

JAY: You eventually had to go to school.

RICE: That's correct.

JAY: So you went to school, first grade or whatever. Did anything happen to you when you went to school?

RICE: So after getting into school, what would happen is that somebody would either come in the morning or towards the middle of the day. And I'd get picked up to allow me to get out of school. And then, they would take me to an underground facility or just a regular building to do the training that they had us go through.

JAY: Was there a break between the university program and this new program, which was I guess MILAB, is what you're saying?

RICE: That's correct.

JAY: Explain to our viewers what MILAB is.

RICE: The MILAB program is a military abduction program. Which is one of the agencies responsible for recruiting, training, indoctrinating, and preparing children for special programs within the Secret Space Program and other classified projects. I thought, at the time, I was just getting to go out on a special field trip.

JAY: And you're with other children?

RICE: Other children--between three and five other kids at a time. That's what I

remember. And they had us working on very simple puzzles. The caveat was that we weren't allowed to talk. But we had to work in teams of two, sometimes three, and work together to put this puzzle together. And what they were doing is, they were training us with our intuitive empath abilities in teamwork. Progressed on up through smaller pieces, more pieces. And again, we couldn't talk. We had to nonverbally communicate and trust and work with our intuitive empath abilities up to the point where it was a single colored puzzle with thousands of pieces that were working together. They also included blindfolding to work together so that we could work our intuitive empath abilities and teamwork.

JAY: Would it be fair to say that they are looking for that quality in these kids?

RICE: That's absolutely right. They're looking for that quality in people because it makes for better soldiers, better operatives. You can walk into a room and pick up on a situation--five or six different people all at one time--and be able to read the scenario, read the environment.

JAY: Did you notice a refining process with these kids and you, where you could see that some were not going to make it and others were going to go forward or anything like that?

RICE: Yes--there were people that just weren't picking up on it. They weren't progressing. And usually, those children didn't stay, didn't come back. Because they used medications on us for improving our intuitive empath abilities as well as to facilitate forgetting--not remembering where we'd gone or what we'd done, and then implanting us with false screen memories.

JAY: Why would they do that?

RICE: They didn't want to have the public aware of what they were doing. I mean, they were taking kids out of school to do whatever they needed them to do. If the world had found out that they were taking kids out of school to go work on training and that they were injecting them with either experimental or non-market medications, people would be up in arms.

JAY: Was there any kind of trauma associated with this?

RICE: Yes.

JAY: Well, tell me about that.

RICE: Yeah, so some of the training involved finding out our individual fears and then flooding us with those fears. For instance, if one was afraid of drowning. Because that, they would use virtual reality, augmented reality. And again, this is in

the late '70s, long before any of it was ever out on the market. And so as a child, it was like--wow, this is an amazing toy. This is a great adventure. Except for the fact that they were trauma training, is what they were doing. So they find out all of my fears, everything that I was afraid of--whether it was a little or a lot--and then put me into a virtual reality where I couldn't tell the difference between what was real and what was the virtual. And then, I'd go through and have to experience--whether it was death by fire or getting shot or bludgeoned or drowning or any number of horrible ways to die. They'd flood you with it to desensitize you to it. And these are children.

JAY: When you got home after these experiences, did your parents notice that you were messed up?

RICE: Well, they would go through and mind wipe and give you a screen memory. So instead of getting burned up in a fire all day five or six times, I would remember being at an aquarium in my conscious mind. But the nightmares were still there. I'd still have nightmares. I'd still have periods where I wouldn't eat or periods that I was moody. So of course, my parents had nothing to base it on. So to them, I was just a kid growing up. During the night, they would take us out of our homes. They would take us to closed-down malls for the evening. And then, we would either do small combat arms, immediate action drills, capture the flag type thing where we would have small pistols. And we wore a suit that, if it was contacted by the infrared beam, it would freeze the limb if it was a grazing shot. If it was a shot right to a fatal area, then the entire suit would freeze up. And they'd have to reset the program because that was a simulated kill. They would put us against each other. And we found out quickly who had more strength in their ability for tactics. And so what happened is, it turned into not every man for himself. But it turned into teaming up with other people and then ganging up on one person.

JAY: So kind of creating a self-organization. So you guys are organizing yourselves in a symbiotic way instead of having it be top-down.

RICE: That's correct.

JAY: That's very serious training.

RICE: Very traumatic, it's very traumatic.

JAY: How long do this period of your training last?

RICE: It went on for about eight years until I was 13.

JAY: All right, so now you're 13. You've got this training. They wouldn't be doing it for no reason. It costs a lot of money. They're investing a lot in you. What happened at this point?

RICE: That was the year that they took me out of training and put me into active service.

JAY: What happened? How did this--did they tell you they were going to take you into the Secret Space Program, or what do they do?

RICE: Well, this particular day, I was going to meet them down the street from school. Now, according to the rest of the school, I was just skipping. But I was down the street. I met them just like any of the many other times. Got in the back of the car. They didn't tell me that I was going to be disappearing, that was going to be going into active duty.

JAY: They did not tell you.

RICE: Did not--they just took me.

JAY: That was a surprise.

RICE: Surprise--guess what. I hope you said goodbye to everybody this morning. I don't have all the memories from my first 20 and Back. They haven't returned yet. 20 and Back program is based on the use of advanced technology where you provide service for 20 years. And at the end of that service, you are medically and quantum age regression back to the time point where you originally entered into service. And then, they take you back in time to the point in time that you originally went into service. But you still lived out and had those 20 years of service that you provided in whatever program. And there's a number of secret space programs that utilize this technology.

JAY: And did they take care of you when you came back?

RICE: When I got back, part of the going away present package that they left included programming for me to want to go into the military service. And seemingly overnight, I developed an interest in the military. I wanted to go to college, wanted to get an education. I was a driven individual at that point.

JAY: Did you go to high school, I assume?

RICE: I went to high school and maintained 3.9 GPA all through high school. And I was awarded a medical scholarship for the Air Force ROTC. And I was awarded an engineering scholarship for the US Army. And I chose the engineering.

JAY: And did you finish your four years?

RICE: I finished my four years.

JAY: And then, you went into the military.

RICE: The military 20 and Back that I went on was right at the start of my US Army career. The second 20 and Back, I have a lot more of those memories. I was commissioned the same day I graduated from college which was in December of 1996. And two months later, I was given a change to my orders. Which my original orders were to report in to Fort Leonard Wood to attend the officer basic course. And the day before I was supposed to leave, I got new orders assigning me to the Army Research Office up in North Carolina. I had no idea why or what, no explanation for it.

JAY: So two months after you started your active duty, they grabbed you again.

RICE: Again.

JAY: Why are all these people now coming forth with memories, but it seems like it takes 15, 20 years for the memories to surface? Why do you think that is?

RICE: Well, for some reason or another, the memories are always there. For me, one of them was at the age of 33 which happens to be 20 years after my 20 and Back. I went in for outpatient surgery. And coming out of it, I was still under a lot of the anesthesia. And I don't recall this. But the nursing staff told me I was talking about being in space and being a part of a program and going out and doing things. And of course, when they were telling me this, I'm like--wow, I don't remember saying any of that. And at the time, it was just one of those--OK, that was just the anesthesia talking. Since then, I've realized that--OK, that was another sign.

JAY: Should people who are running these programs be worried about people now having the first wave of memories coming back?

RICE: I think the people that are running these programs--part of the technology that they use for the mind wipe, they know that there's 1% to 3% that the mind wipe will not work on. And they have returning memories a lot faster than mine were. It worked on me. Anybody that was a part of the Secret Space Program were tampered with--every one of us.

JAY: Well, I just want you to know that I'm really happy that you've decided to come forth and tell your story. And we're going to be telling your story in great detail as we proceed here in later shows. But let me ask you. Are you afraid that someone is going to stop you from speaking out?

RICE: I have concerns for the safety of those that I love and care about. But having been through and remembered the things that I've gone through, I feel more compelled to bring this into the light than I am concerned about my own safety.

A New Insider Is Put to the Test Season 12 Episod 6

Cosmic Disclosure; A New Insider Is Put to the Test Season 12, Episode 6

JAY WEIDNER: Today we have a special guest. His name is Jason Rice, and he claims to have been in the Secret Space Program. His story is incredible, and I'm sure you will find it compelling. Hey, Jason.
JASON RICE: Hello, Jay. Thank you for having me.
JAY: Yeah, it's great to have you, because your story is absolutely fascinating. You went to university at the auspices of the Army.
RICE: I went to Florida Institute of Technology under a four-year engineering scholarship. And I was awarded a medical scholarship for the Air Force ROTC. And I was awarded an engineering scholarship for the US Army. And I chose the engineering. And then I was commissioned the same day I graduated with a Bachelor of Science in civil engineering. And in fact, at the end of my education, I had applied to go on and get a master's degree. And they said, nope. You're graduating in December, and you're starting your commission and active duty immediately.
JAY: So two months after you started your active duty, fully expecting just a change in orders, and everything was going to be copacetic. And then what happened?
RICE: Well, I show up at this facility and meet my new company commander. We got into the first elevator, and there were two buttons--up, down. That was it. He placed his hand on a scanner on the wall, and then we started our trip down. It was about a five-minute elevator ride. And towards the bottom, I recall that there was a very peculiar feeling of vertigo, where the world seemed to turn sideways for just an instant, and then it was gone.
JAY: And were there cameras in this elevator?
RICE: I'm sure there were. I never saw them. As they later told me that from the moment I stepped foot in the facility that I was being watched. And all of my actions and choices and decisions were being recorded and used for part of my training. So we get to the end of the bottom of that first elevator ride. He had his hand on his sidearm. It was a Beretta. And was very, very intently watching what I was doing. Of course, I didn't know about the--
JAY: Oh, he was afraid you might go psychotic?
RICE: He was worried that if I went psychotic I would try and attack him. And I later found out that he had had to use his sidearm on another trainee earlier that day. So we get to the end of the elevator ride down, and it opens up onto a red-lit platform that's about 12 feet high, 10 feet wide. And 10 feet in front of the elevators is a track, and there's a capsule transportation train, if you will. And it's shaped like a pill. It has a Lamborghini-style door that's opened. It was white. The capsule that we were getting into was barely shorter than the landing. So we get into the capsule, and I sit down on

the right side. And he comes and sits down in front of me. And our knees are only a few inches apart. And the door closes. And I couldn't tell which direction we were moving in. And then I sat quietly, and I got the feeling that we were moving in a direction towards my back. So I was facing rear. And so that trip, it lasted about 30 minutes. We passed through a portal, and we're no longer on Earth.
JAY: The train passed through a portal?
RICE: The train passed through a portal and took us to another location. I was able to recognize that because the background Schumann resonance was different. It wasn't the same as here. And so I was able to pick that up. And that actually came out during hypnosis.
JAY: OK, hang on here. First off, what's a Schumann resonance?
RICE: OK. The Schumann resonance is a background frequency that is present on Earth.
JAY: So you felt a shift in that background frequency when you went through the portal?
RICE: I felt it, yes. After I went through the portal.
JAY: What was it like going through the portal? Was there any physical feelings? Mental feelings?
RICE: I was so focused on that vertigo, the world going sideways in the elevator, that I was still overwhelmed with, OK, what's going on.
JAY: The newness.
RICE: The newness. This is all different. I've never seen any of these things before. And I didn't notice a difference at that time. It was a minor difference. It couldn't have been that much, going from the background frequency here to wherever it was that we went to. It couldn't have been a shift of that much. And they supplemented it with an artificial background frequency as well. Which--subtly different, but different nonetheless.
JAY: Describe what a portal is.
RICE: Portal technology is used for travel, and it can take a shape of as large as they need it to get a vehicle or a person. And it's to instantaneously move from one place to another. It could be within a solar system, or it could be somewhere else in the galaxy. So for all I know, I could have been 1,500 light years away. Or it could have been a mined-out asteroid that's within our own solar system. I suspect it was Mars.
JAY: What happened then?
RICE: Well, a 30-minute capsule ride. We pull up into what turned out to be the next landing, our stopping point. I couldn't feel the train stopping, the capsule stopping. So the only indication I had that we had arrived was the door started opening, and it scared the shit out of me because I thought we were still moving. And I expected to see it get ripped off any moment. And the captain that was with me knew it. And so he knew that we were going to be stopping, and he was watching to see what my reaction was. And so he saw me freak out for a moment, because I thought we were about to witness the capsule coming apart. And he smirked. And I knew right then that, OK, this is another one of those new guy tricks. All right, I get it. And so we get

out. And we're in this new landing that was about 100 feet long, about 30 feet high. It was all white lit. It was no longer red lighting. And so there were a bank of three elevator doors--two standard-sized elevator doors, and then the largest set of elevator doors I've ever seen in my life. These things were big enough to drive a semi truck into.
JAY: Really?
RICE: They were enormous. So we would walk up to one of the man-sized elevator doors, and he hits the button. The doors open. And I look from him into the elevator. And no more than four feet in front of me is an alien staring at me.
JAY: Really? In the elevator?
RICE: In the elevator. About four feet tall. Large, dark eyes. Small mouth. Small nose.
JAY: And how did you react?
RICE: I turned and looked at the captain, who was on my right. And then pointed at the elevator. And I said, there's something in the elevator. And he said, what is it? And I looked back at the elevator, and it was gone. And I wasn't about to tell him what I'd seen, because at this point I was still clueless on what was going on.
JAY: Were you scared?
RICE: I was surprised. Thinking back on it, it wasn't a fear so much as, what's he doing here, not what in the world is that. So the captain didn't give any indication that there was anything strange. And so I--following his lead and not about to tell him, my first commanding officer, that I had just seen an alien in the elevator, I chalked it up to another one of those new guy tricks.
JAY: So, Jason, one of the things that we did besides giving you a polygraph is we had Georgina Cannon, who is a noted hypnotherapist, come and hypnotize you for almost three hours, actually. I guess that was the point, actually, of doing these sessions, was that we were hoping that it would release more memories and kind of create a cognition for you after the sessions. And that happened, right?
RICE: Mmm, it has happened. It has been helpful. OK, so let's listen to a section of that regression section. GEORGINA CANNON: And tell me what happened.
RICE: Well, we got in the elevator and rode up. And when we came to a stop, we were inside a giant coliseum. CANNON: So tell me about the briefing that you all had.
RICE: They took us all in into the auditorium. Colonel Schuller came up first. And he talked to us, thanking us. He thanked us for volunteering. If we'd only known.
CANNON: So what did Colonel Schuller do? He thanked you for volunteering, and then what?
RICE: More bullshit. Like we had a choice. They told us we were the tip of the spear, and we'd have the best equipment, and that we were going to help other planets. Other people.
JAY: So you got hypnotized. What was that like?
RICE: Well it was--it was very helpful in that there were things that came out during

the hypnosis that I hadn't recalled yet. And so there are a number of points and pieces of the puzzle that I'm very, very thankful for. During the hypnosis, I recall having images of doors opening and closing. And since then, I have had more memories return. I do know that, again, part of the going away presents that were left with me included shutting off memories and shutting off things, as well as routines, if you will, that continually work on removing memory from the events. So there were things that came out during the hypnosis that I've been able to recall some of. But after the hypnosis, I couldn't remember some of the specific details, again, because of the memory routines that they left me with to wipe those out. So that's a continuous battle that I have to fight regularly, on the remembering side of things.
JAY: OK, I want to get into this in more detail. What do you mean by memory routines? What does that mean? Are you talking about screen memories?
RICE: Well, I'm talking about the routines that they have to--think of it as like the mental eraser that they have that's running in the background that is continually trying to remove the memories from the conscious mind. So that, again, you don't talk about things that you're not supposed to.
JAY: So it's almost like a loop that they put you through. So when you think a certain thought, this loop comes in and causes it to just kind of become a maddening thing inside your head. And then you don't want to think about it anymore.
RICE: Yeah, well, it's almost like putting a frosted glass in front of a window, is that you wipe away the moisture, and you can see for a moment. And then the condensation comes back. And you have to work at continuing to wipe the window off to remember it.
JAY: That's a great analogy, actually. So you'd recommend other people that have been in the Secret Space Program to actually go and do this also?
RICE: I would. I would highly recommend it. When I first started waking up, my first response was, gosh, I'd like to have all these memories back at one time. When I had certain memories come back I realized the folly in that. And that, for my own sanity, my higher self has decided what and when and the timing of it. And so trust in that, as well as getting help with those, either through hypnotic regression or through therapy. There's a number of ways that you can help yourself to recall those memories.
JAY: All right, so this train has taken you into this room. You see this alien in the elevator. The captain doesn't act like he sees it. Alien disappears. What happens then?
RICE: We enter in the elevator. The captain accompanies me and gives me a very knowing look. And he hit the up button. Doors close, and we rode the elevator up. It wasn't a very long ride. I suspect it was probably four or five floors up, is where we went to. This time, when the elevator doors opened, it was still a natural rock formation, except it was the size of an NFL stadium.
JAY: This area--is this in a cave?
RICE: Yeah, it was all in a natural rock cave. All of the stops once we had gone underground were in natural cave structures. This was no exception. When we entered that last elevator and went up to the training grounds, it opened up into the largest

underground cave structure I'd ever seen in my life. I had never seen any pictures that are equal to it.
JAY: How was it lit?
RICE: That was one of the really interesting parts of it, is that the walls and ceiling, they all seemed to be lit--well lit. Bright as daylight. But I could not find any origin of the lights. It was almost as if the walls themselves were lit in a way that you couldn't localize where the lights were coming from. But there was no disputing that the whole area was lit.
JAY: Was really kind of a color or hue to the lighting?
RICE: It looked very daylight. Very much like daylight.
JAY: And what was going on in this gigantic cavern?
RICE: Well, it was empty at the time. I was gawking like coming to the city for the first time. And, of course, the captain started walking as soon as the doors opened. And I could see across that it was a track with the vibration absorptive material on it. They had--
JAY: The what?
RICE: Vibration absorptive material. It's like foam, rubbery, around the track. You usually find it on indoor tracks. The inner field on the track itself was clearly AstroTurf. It looked like grass. The outer areas had some training seats, tables, chairs. Something that anybody in the military recognized as a class area. They had what looked to be a volleyball sandpit. Except it didn't have any posts or nets. They had a shooting range on one side. Elevated above the ground were these networks in series of catwalks. Some of them had rails. Some of them were missing rails. There were ropes hanging down from the ceiling with a single carabiner on the end, which are the little latch devices that's commonly used in mountain climbing and rock climbing.
JAY: So this is a training facility.
RICE: It's exactly what it was.
JAY: And for soldiers.
RICE: For soldiers. Except, for the life of me, I couldn't figure out why they needed a trapeze-type training facility for soldiers. Later I found out why.
JAY: Why?
RICE: Well, it has to do with--the hang glider part of the training involves using a neurally operated gravity pack. Utilizing the grav packs so that we could create thrust so that we could gain altitude, lose altitude. That ended up being the training grounds for where we were learned about small unit tactics, avoiding each other, not hitting each other, firing from it.
JAY: So you were using hang glider devices to fly around?
RICE: Yes. Well, the packs were battery powered. Which meant that they had a very limited duration. If you burned a full burn without stopping, they would only last for probably 30, 45 minutes. They didn't have much of a long life. And so what you did was you used them in concert with the glider. And so you weren't hovering, but you were flying.

JAY: Sometimes you're using the electric, sometimes you're not.
RICE: Sometimes you're using the electric, and sometimes you're not. We generally used them to gain altitude or to counter for firing our weapons. So you had to learn how to use it mentally first. Help turn left, help turn right, up, down.
JAY: All being neurologically driven. Through a helmet or something?
RICE: Yep, through our combat helmets. So, using the weapons that we used, we had to counter it with the grav packs. The hang gliders were not the ideal platform to be staging an attack.
JAY: I was going to say, yeah.
RICE: They were more intended for dropping in, relocating, or for getting in using stealth methods, because it's ultra quiet.
JAY: Interesting. So then, you're in this big, huge facility. Clearly you know that you're going to be part of something here. Then what happened--they haven't told you yet that you're even in the Secret Space Program. This guy hasn't even talked to you at all, the Captain?
RICE: Nope, hasn't said anything--to hold all questions. Yep.
JAY: So what happened next?
RICE: There was, at the time, what I thought was a very strange-looking container--shipping container--with odd-looking doors. There was also a movie screen-sized surface that had blackened, charred marks and partially burned areas on it. And all of those were on the mobile cable system so that they could relocate them any place in the stadium area. The flat screen didn't mean anything to me yet, but that was one of the targets we used with our plasma rifles. It was a specially treated surface so that we could live fire our plasma rifles without starting a massive conflagration.
JAY: What's a plasma rifle?
RICE: It shoots out a ball of hot plasma, as hot as the sun, that will travel at unbelievable rates of fire, and does incredible damage. At that time, it didn't know what any of that stuff was used for. I'm just walking through and amazed that it's even there. It smelled like moldy, misty, musty campfire.
JAY: The whole cavern?
RICE: The whole area, yeah.
JAY: Very musty? Is there water dripping?
RICE: No, no water dripping. They sealed off the interior surface of all the walls. So there was no water. Any water that came in would have been a leak, and they would have found it quickly.
JAY: Outside of the door you came in, were there any other doors?
RICE: There were doors in other areas of the training coliseum. But the ones that we headed directly for were directly across from where the elevators opened up.
JAY: Did you ever discover what this weird container thing is?
RICE: I sure did.
JAY: What is it?
RICE: It is for simulating the exit from one of the shuttles. So they were able to move it around at elevation so that you could basically jump out from it. Again, because

you're dealing with people that have not done this before that are learning how to use the neural interface, as well as flying, as well as shooting, as well as aiming and trying to hit what you're trying to hit. There were a number of close calls where people were almost hit, or there were a couple of rounds put through gliders. Again, you're trying to coordinate all of these things at one time. So that was very--
JAY: Is it safe to say this is the beginning of your training?
RICE: This was the beginning of my training.
JAY: Did anybody die in this training?
RICE: Yes. There were deaths.
JAY: Sounds very dangerous. So what happened after you saw the cavern? Where did you go next?
RICE: We went through a door on the other side, which entered into a hallway. Traveled to the end of that hallway and entered into another hallway. And at the end of that door was a stairwell. And the captain started going downstairs. And I snuck a peek to look up through the center of the stairwell to see, OK, how high does this thing go? And I couldn't see the top. So it had to have gone at least to the top of the training stadium.
JAY: Right.
RICE: And so, when we came into the next hallway, he made an immediate right turn into the first door. And turns out that that was the conference room that we would be spending the next couple of hours going over paperwork, paperwork, signing for this equipment, signing for that equipment. Still no briefing. So I walked in, and he told me to have a seat. And I sat down next to him. And in front of me were a stack of papers in a folder. Inside this room was a black stripe around the top. 12 inches. It was only about 3/4 of an inch wide but about 12 inches from the ceiling. And it went all the way around the entire room. At one end of the room was a large flat screen TV. It looked to be about 60 inches.
JAY: So what's this black stripe doing?
RICE: The black stripe around the upper portion of the room turned out to be full monitoring equipment, which included bio signs, video, audio, anything and everything that they needed to determine--infrared. Who's in the room, whether they're sweating a lot, or they're cool, they're calm, they're collected. So I didn't realize it at the time. It just looked like a black stripe.
JAY: So you signed all these documents.
RICE: Signed all the documents. Spent two hours signing.
JAY: Is anybody telling you? You're getting debriefed on any of this?
RICE: He said, hold all questions. He said, we've got a lot of work to do in a short amount of time. You'll get a full briefing day after tomorrow, after everybody is here. You'll get it the same time everybody else does. And the thing is that they plan it that way to keep you guessing so you don't know what's going on, so that they can gauge and judge and evaluate your reactions to unknown, stressful situations. Sitting in front of the captain as well was a blank slating device. That was the first time I'd ever seen

one, that I could recall.
JAY: What does that look like?
RICE: The one that I'd seen resembled a jeweler's hammer, which is a small hammer. Except instead of having a hammer head, it had a small, conical and crystal fixture on the end. And a plain black handle, no markings. A single button on it. So I didn't know what it was about, and I had no idea. Found out if I had declined the offer, that that was what my fate was going to be, to be mind wiped and blank slated, and sent back to Fort Wood.
JAY: You know, a lot of people are going to be watching this. And they're going to think that you're crazy. Or they're going to think you're a liar. And you don't come off crazy, I have to tell you. But the lying part, we can't tell. So what we had you do was take a polygraph test from a polygraph examiner. And we want to show you the results of that right now. BRIAN HOFF: Jason, go ahead and relax. Remain still. The test will begin in a moment. The test is beginning. Are you now in the state of Colorado?
RICE: Yes. HOFF: Regarding your extraterrestrial experiences, do you intend to answer my questions truthfully today?
RICE: Yes. HOFF: Have you ever said anything in anger that you later regretted?
RICE: No. HOFF: Were you ever a member of a Secret Space Program?
RICE: Yes. HOFF: Did you ever engage in military service on the planet Mars?
RICE: Yes. HOFF: Have you ever told a lie to keep yourself out of trouble?
RICE: No. HOFF: Were you ever a member of a Secret Space Program?
RICE: Yes. HOFF: Did you ever engage in military service on the planet Mars?
RICE: Yes. HOFF: Have you ever told a lie to keep yourself out of trouble?
RICE: No. HOFF: During your entire life, have you ever broken even one law?
RICE: No. HOFF: Have you ever killed an extraterrestrial being?
RICE: Yes. HOFF: Have you ever been captured by an extraterrestrial being?
RICE: Yes. HOFF: During your entire life, have you ever violated any rules or regulations?
RICE: No. HOFF: Have you ever been captured by an extraterrestrial being?
RICE: Yes. HOFF: During your entire life, have you ever violated any rules or regulations?
RICE: No. HOFF: OK, the test is ending. Please remain still. What you're looking on the test is changes in breathing patterns or upper body movements and activity. Down here a little bit more, you're looking for GSR changes, or Galvanic Skin Responses. Essentially, it's opening and closing of sweat glands in our fingertips. Just below that, what I'm looking for is changes in blood pressure, heart rate, et cetera. Below that on the screen, what I'm looking at is PPG readings, which is Photoplethysmograph readings. Essentially, what that is is the opening and closing or the constriction of blood vessels in your fingertips. Some of the other readings I have on there are whether or not he moved or was trying to cheat the test in any way, and he wasn't. So what I'm looking at on the screen right now is that, for the directed lies that I asked him to tell, which were, you know, have you ever broken any laws, stuff like that, he

does have a physiological response that comes from that that is indicative of somebody normally lying to us and that physiological result that I've come to expect. When we see the other questions where he answers yes to being part of a Secret Space Program, or being on the planet Mars, there's not that typical physiological arousal that we would expect to see when somebody knows that they're lying. Again, any time that there is an extraordinary story that is so far out of what is normal and out of what I know as a human being and from my experience, of course there's some doubt that creeps into my mind. Having said that, Jason seems like a very credible source. He's well spoken. He came in here. He seems to know exactly what he feels happens when it happened. All the polygraph can really tell us is whether or not somebody believes what they're saying is true. Physiological indicators indicate that he does not have an arousal of any sort of biological indicators that tell me that he disbelieves his story even in the slightest. So in that case, what I'm saying is that, ultimately, Jason believes what he's telling us to be true.
JAY: So the guy conducting the polygraph kept asking you the same questions over and over and over. I'm sure it was driving you crazy. But I think they were doing that because they were trying to elicit different emotional responses from you to see and guarantee that you were being credible, I think. Don't you?
RICE: Yes, yes. The direct lie stimulation test, from what it was explained to me, was that they try and create a baseline for lying, as well as for telling the truth.
JAY: So the question about have you ever broken a rule, that was a preconceived lie that was--
RICE: That's correct.
JAY: --so that every time you lied, you would see your response. So that could be matched against the other responses, where you were telling the truth.
RICE: That's correct.
JAY: Interesting. So how did you feel being asked these questions over and over and over?
RICE: It was anxiety provoking because when I start talking about my experiences, it would induce anxiety or other physiological effects to try and distract me from talking about it. And that's part of the program that they use for people that are getting out, is they don't want you to talk about it. So they put programs into your psyche so that you either have an anxiety attack, or you start sweating, or the room gets too small no matter how big it is. You can't focus. You can't stay attentive to what you're trying to talk about. When I first started waking up and remembering the things that I had done, it was really difficult because of those programs, those presents that they left with me.
JAY: Well, clearly, you are not lying. At least you believe what you're saying.
RICE: I've known that what I'm saying is true. Even as shortly as a few years ago, if you'd asked me that whether or not I believed I was a part of some Secret Space Program conspiracy, I would have said, no, sounds interesting, but that's not me. However, participating in it, having the memory recall that I have of the experiences and the events that I have, those things that have happened to me, the experiences that

I've remembered, have proven to me without any doubt at all that I was a part of that program.

History of the Secret Space Program Season 12, Episode 7

Cosmic Disclosure; History of the Secret Space Program Season 12, Episode 7

JAY WEIDNER: All right. Let's go back to our chronology. Last time we visited, you were telling us about--they had made you sign a whole lot of documents, and then you joined something called IDARF.

JASON RICE: The Interplanetary Defense and Reaction Forces were a unit that was border patrol used for assistance on other planets. However, there were a number of training exercises and training periods that we spent here on Earth. Later in my deployment, I found out a lot more information about the history of the space program--this one in particular.

JAY: And where did you find this out?

RICE: Well, it was while I was stationed on the second planet during my second deployment. And we'll call him Yohan, a friend of mine that was also an officer--German descent. He was a Mars German. Not all of them were arrogant jerks. Just like our population here, you have a mixture of good people, nice people, not so nice people, so same thing with the Mars Germans. Generally speaking, they had an arrogant streak that would put any politician, actor, or professional athlete to shame. And part of that was because they were genetically modified. They did have usually stronger, faster, higher reflexes, higher IQ.

JAY: Wait a minute. Are you saying that the German people are some kind of genetic experiment?

RICE: The Mars German civilization--they have been tinkering with their genetics since they went independent. During the deployment, we never would have talked about any of this around or near any senior officer as well as around any chances of being recorded.

JAY: So it was really--you weren't supposed to be talking about what the history of this whole thing was?

RICE: That's correct.

JAY: Well, you must have been really curious.

RICE: Of course I was.

JAY: Everybody must have been really curious how this all happened. I mean, everybody is speaking German, and we defeated them in World War II. And why are we taking orders from Germans?

RICE: Yeah. Why are all of our commanding officers have German descent or German accent?

JAY: So you're already just curious as hell when you met Yohan.

RICE: Yes. And during the training early on, when I first met him, he knew things about technology that none of the other trainees knew. And so he'd been exposed to it. I knew that he had. And they tell and educate their citizens a lot more on what really happened. Now, I am absolutely certain that they also provide them with propaganda. But the origins, what happened pre- and post-World War II, what's happened on Earth, their involvement with alien species, the lessons that they've learned from those involvements--their people are a lot more educated on that.

JAY: So World War II ends. We know the Germans were developing the foo fighters and our early UFO technology, but they didn't save themselves from the allies at the end of World War II. They were defeated, so what happened?

RICE: Well, in the late '30s, there were a number of secret societies and the Vril Society being one of them, that the German state absorbed into their R&D programs. And they were already visiting other planets at the end of the 1930s.

JAY: So they had developed technologies in the '30s?

RICE: In the late '30s.

JAY: Wow.

RICE: They had developed these anti-gravity or saucer technologies that allowed them to travel outside of our atmosphere.

JAY: And why didn't Hitler use this for fighting in World War II?

RICE: Well, he wanted to.

JAY: But he didn't. So why didn't he?

RICE: The problem was that they couldn't outfit these UFOs with modern conventional weapons, because of the second law of momentum. They couldn't shoot and expect it to stay on place. As you get a force in this direction, you're going to get a reaction in the opposite direction. And so since it's in the air, they wouldn't work.

JAY: So conventional weaponry doesn't work with zero-g craft?

RICE: Not unless it's corrected. And they didn't have that advancement yet.

JAY: Right. It does make sense.

RICE: They were trying to work on energy weapons in the early '40s. The reptilian race was helping the Germans--required that, we want you to build a base in Antarctica.

JAY: Dracos, are you saying?

RICE: Yes.

JAY: Reptilians or the Dracos? Who are the Draco?

RICE: The Draco are a group of alien entities that are reptilian involved. They range in height from 8 to 14-feet tall. It's my understanding that there are also some variations of them that are shorter than that. Some of them have vestigial tails and wings.

JAY: OK, so the Dracos are now in an alliance with the Germans, beginning of the 1940s?

RICE: Yes, and working together with them.

JAY: OK, so they had gone to Antarctica in 1938, the first polar expedition by the Germans. And you're saying in the early '40s they were told to make the base there?

RICE: They were told to build a base there. And so they built a base under the ice, capable of sustaining upwards of 3 to 400,000 people.

JAY: Whoa.

RICE: And so they started stocking it out and building it out. And the purpose for that--and of course, the Draco didn't tell them this at the time, but they wanted to have a proxy in place that would help them recover some of the alien technologies that were down there--are down there.

JAY: I see. And they were--of course, nobody knows about the place, so you could work with no one knowing what you're doing.

RICE: Nobody around. That's right.

JAY: It's the perfect place.

RICE: That's right. So the end of the war marked a period where the group that was down there said, thankfully, we can get away from this self-destructive government. We can run things the way we want to, working on their base defenses, working on their technology. By 1947, they had mastered the mobile platform weapons, so that they were able to outfit their anti-gravity craft with these weapons.

JAY: Now, they have this very serious advantage as far as weaponry.

RICE: That's right. Weapons, platforms. They outclassed anything and everything else on the planet.

JAY: So we're now in '46, '47. It's after World War II and a lot of UFO sightings are starting to happen--Maury Island and Roswell. Are these associated with the Germans?

RICE: From what I understand, some of them are.

JAY: Did they then alert the governments of the world where they were located?

RICE: They didn't tell them where they were.

JAY: I see.

RICE: But through either espionage, or through other sources, through capturing people that were in and out of South America, they found out. The rest of the world did.

JAY: And the United States in particular find out.

RICE: Specifically. Yes.

JAY: And then, what did the United States do about it? The fact that their enemy is, like, creating a base on Earth and they're not taking care of it?

RICE: Well, within a year after the end of World War II, they had already started making plans for sending a fleet down to Antarctica to finally do away, in their minds, with these pesky Germans once and for all. And so Operation Highjump was the result of that.

JAY: And who led this expedition?

RICE: Admiral Byrd.

JAY: Admiral Byrd? Right. So what happened when he got there?

RICE: When they got down there in late November, they started setting up their base and establishing where they were going to be operating from. And they found the German base and so ensued a small action on the part of a few UFOs that were actually armed with direct energy weapons--destroyed one ship, killed a number of people, and sent the entire fleet packing back to the United States. And that was the point at which the Antarctic Germans started negotiating with essentially the Cabal, the rest of the world.

JAY: So Operation Highjump essentially became operation hightail.

RICE: Hightail. It did.

JAY: Yes. So Byrd--then he comes back to the United States. And UFO sightings now really start increasing--abductions. What people don't realize is even Betty and Barney Hill--when they were abducted, one of the things that characterizes these missing people is that they have a German background. So are they stealing people of German descent?

RICE: Yes, there's a lot of German descent or German genetics involved with those that either are part of the current SSP, or those that were abducted. Part of the negotiations that were occurring between the Antarctic Germans and the Cabal--essentially, the Cabal were given the list of requirements. It established them as a sovereign country. It established embassies in every country around the world. Another thing that was required was that there would be between one and five senior executives from the Antarctic German civilization, that would be put into position of senior executives for every corporation around the world that was aerospace, automobile, petro-chem. Basically, every major and main industry on the planet now had between one and five senior executives that were Mars Germans.

JAY: And I would guess that Operation Paperclip is a result of this treaty.

RICE: Operation Paperclip was the first stage of it.

JAY: And what is Operation Paperclip?

RICE: Operation Paperclip involved integrating German scientists, and technicians, and engineers into corporations of the Western world and getting them passports, and setting them up with homes and jobs, and basically, paving the way, opening the doors, and laying out the red carpet.

JAY: It was basically the United States. And the Germans had targeted the United States for its resources.

RICE: That's right. They knew that the manufacturing and resource abilities of the

United States were vastly larger than any other country at the time.

JAY: So logical to infiltrate, take over, and then use all of those corporations to enhance your power.

RICE: That's right. The late '40s were the same time period that the Mars Germans started planning for and building their bases on the moon as well as Mars. And it was during the late '40s period that the Germans, when they went to the moon, discovered a couple of things. They found out, number one, that the moon is an artificial satellite construct. And it was not originally part of the Earth. It was brought there from somewhere else as an escape ship. And that it is built out inside. And most of the real estate is already spoken for. And so when they were wanting to find a base, they couldn't find space. So the dozens of alien races that are on the moon and have bases on the moon--they jealously guard their property. There's no fighting. But if you try and take over somebody else's land, they're allowed to defend themselves.

JAY: Sure.

RICE: And the Mars Germans did not have technology to take that kind of fight. So they had to find somebody that was willing to part with some of their land. And turns out that the Draco either bribed, blackmailed, or manipulated it so that the only race the Germans could go to, to ask for--was the Draco. And so the negotiations that ensued between the Draco and the Mars Germans was for 20 acres of land. And the Draco were originally asking for 225 females and 50 years of first refusal rights for the technology that the Germans uncover in Antarctica. Well, the Germans immediately said there's no way we're giving you 225 females. First off, it's a practical matter. We need as many childbearing females as we can to continue our society. So six months later, they were able to hammer out a deal where the Antarctic Germans provided 150 males, 75 females, and they gave the Germans 25 years of first refusal rights of the technology.

JAY: The technology that was under the ice in Antarctica?

RICE: It was under the ice. They had--in a lot of circumstances looked like a rock. They didn't know what they had.

JAY: Sure.

RICE: What later the Germans found out is that there were at least six other races that would have given them twice the amount of space for not a single person and one-year worth of first refusal rights. So the Germans were suckered horribly. The stories that my friend told me during the exchange was very eye opening as to the type of beings that they were dealing with.

JAY: Why did the Dracos want these people? What's the purpose?

RICE: They wanted to use them for experiments. They wanted to use them for manipulations.

JAY: Experiments?

RICE: They wanted to use them for food source. There's any number of reasons why they wanted to use them.

JAY: For basically slaves?

RICE: Slaves, slave labor, for their own form of entertainment, and the many forms that dark forces or dark agents want to abuse, or use, or control, or destroy. Those were the reasons.

JAY: That's really disturbing.

RICE: It was very disturbing to think that those people that were in negotiations. Because I asked my friend about that. Well, what did the negotiators think? You're handing over your people to an unknown fate. And his response was they were there. It was all business. And besides, none of their families were going to be the ones turned over.

JAY: Do we know where they got these people?

RICE: It was from their own citizenry at that point.

JAY: Oh, really? So it was Germans. Were they demanding German?

RICE: No, no, but that was all they had access to at that early stage.

JAY: I see. And the abductions that happened later that really started ginning up in the '50s and '60s--is this possibly--

RICE: Part of that maybe, or maybe additional agreements. My suspicion is that it was related to agreements with other alien races or for their own testing purposes.

JAY: You mentioned the Vril Society. So the Vril Society had somebody channeling?

RICE: Yes. Maria Orsic was the channel that they were using.

JAY: So this early channeling was from extraterrestrials?

RICE: Yes.

JAY: And it was real information that they were giving?

RICE: It was. And they doubted it at first, until they started building out what was included in the blueprints. And the drawings that were made that were channeled were engineering drawings that included sizes, and dimensions, information on materials. It included everything they needed to do to recreate these craft.

JAY: And was Maria Orsic using this information, because she wanted to conquer the world? Or what was her point in channeling this information from these ETs?

RICE: It's my understanding that these original secret societies were interested in advancing the human experience, and that they weren't primarily interested in conquering or controlling other people. Unfortunately, world events turned out such that they happened to be stationed or located within a country that was hell bent on world domination. And so for their own survival, they had to turn over and help the Third Reich develop these advanced technologies.

JAY: It should also be noted that the Germans have had a fascination with this stuff for 120 years now.

RICE: More so. Yeah, there were newspaper articles about the ships that were traveling up and down the West Coast and all the way as far east as Texas. And, yeah, there were a lot of information out there about anti-gravity or advanced technology going back to the 1800s. The German advancement of that technology while the Vril Society and some of the others were channeled information, that the Germans later did have direct contact with the Draco and direct individual interactions with those alien races. And it included help on some of their projects, help with the technologies that they needed, help with memory wiping technology, a number of various medicine, transportation, communications, weaponry. The positively oriented aliens that were trying to advance the human race--they provided some of the technology about anti-grav. They did not--the Germans--they didn't get destructive technology from those aliens. They got weapons and the weaponizing technologies from other ones--from the Draco, specifically.

JAY: And it can be said, without a doubt, that there's never been an explosion of technology that occurred from 1938 to 1945--television, nuclear weapons, lasers. There were so many things that the Germans were--

RICE: Microwaves.

JAY: --working on. It was--

RICE: You name it.

JAY: --amazing.

RICE: There were so many of them.

JAY: And right now, we are 1951 or so in our story. And we know we've--developing these anti-gravity vehicles and other things. So the United States is being changed by this ordeal. Historically, a very pregnant moment.

RICE: Yes, absolutely. The late '40s marked a very crucial moment in the development of the Antarctic German civilization. That was when they started building out their bases away from Earth. They wanted to build a base on the moon and had to find somebody that was willing to give up real estate. And those that--Draco were the ones that they were able to get real estate from. And the deal that they made was for a 100-year lease. The agreement included assistance with technology. The Draco weren't going to hand over advanced technology to them. They were providing them with assistance on the advanced technologies and had continued to do that. The story that Yohan relayed to me about the very disturbing exchange that happened--the Antarctic Germans did not tell the people that were being traded what they were doing and where they were going to. They had 53 guards that were there that were armed. The Dracos showed up. They herded all these people into a cavern that they were supposed to meet at and activated some type of stun device, which froze everybody in place. The images that they were psychically sending to everybody in that cavern were only able to be told about. Because two of the guards were outside the field radius when it happened. The images that they were seen--that were sent included human on human mutilation, assault, cannibalism. Just about every type of deprivation and mutilation imaginable was sent to these people.

JAY: Psychically?

RICE: Psychically of their own family members.

JAY: Why would they do that?

RICE: They wanted to scare them, because they thought it was funny--is the only thing I can think--is that there was some--to them it was entertaining. So the two guards that were outside the field ran. There were three that were outside the field initially, but one of them on his way to the exit was caught by the field.

JAY: Caught in the field?

RICE: Caught in the field. The Draco that were there to pick up their subjects were in full battle armor. And so there was nothing that any of those guards could have done to harm them, much less try and protect the people. Besides, they were there to turn them over. The two guards that did survive were never the same afterwards. In fact,

they weren't able to be conscious without going into extreme distress or going psychotic. And it took, from what I understand, about a year for them to get to a point where they wouldn't go into a catatonic state. Coincidentally, they both suicided about five years later. And so all told that they--the Draco took 278 souls, and that repeated requests by the Germans about the whereabouts or the remains were never answered. So these were the type of beings that the Germans were dealing with. And they'd vowed from that day forward that they would never exchange their own people if they needed to. And eventually, they would. And so they would find other sources of people to be used as pawns. So that was in the late '40s. And that got them the 20 acres of land on the moon to build the Lunar Operations Command.

JAY: Well, that has to be a pretty pivotal moment for this whole thing, because you're finally off-planet. And you have a base off-planet, which can allow you to then go to other places in a much easier fashion.

RICE: That's correct. That was also around the same time they started perusing for Mar's real estate. The problem with Mars is that there are sections of the planet that are highly energetic. And you can't build anything with electronics, because of the charged particles in the atmosphere. So there's only certain areas that they can build out. Unfortunately, for them at that time, they were occupied. So they had to create a big bridgehead and fight for the property that they wanted--the land that they needed.

JAY: Who did they fight?

RICE: Oh, they were alien races.

JAY: Really? On Mars?

RICE: On Mars.

JAY: Not Draco?

RICE: Not Draco.

JAY: Do you know what they looked like?

RICE: I don't know.

JAY: Did the Germans succeed in this battle?

RICE: It took them about 10 years--

JAY: Really?

RICE: --and cost them over 17,000 lives in doing it. And 17,000 may not sound like a

large number. But if you do percentage wise, it accounts for all of the allies' losses in World War II, percentage wise--

JAY: Percentage wise?

RICE: --of their population. So it was a large number. And it was also the most productive, the youngest, the most active portions of their society. So they were reeling from those losses when they first established their Mars base. And as a result, they stepped up their negotiations with the Cabal, because they needed not only to have a final treaty, but primarily, they needed people. They needed active people that can do what they needed to do. So they stepped up their negotiations with the Cabal, which accounts for the extremely large number of UFO sightings in the early '50s, and including the 1952 mass sighting over Washington, DC itself over two weekends.

JAY: And you think that was the Germans?

RICE: That was the Germans.

JAY: To show a force?

RICE: Show a force. They were trying to force the hand. And they still could not get the Cabal to talk.

JAY: Well, that seems to be about the time, though, that the back of their Cabal was broken by the Germans.

RICE: Yes. And Yohan seemed to think that the final straw--because the Antarctic Germans kept telling the Cabal, look, we've got nukes. You don't want to test us. And they didn't believe it. So what they did was provided a demonstration strike on a lonely, single, heavy cruiser returning from Bikini Atoll, from one of the US's own nuclear tests. And they dropped a small yield device, close enough that the EMP disabled the ship. What they had was they had four of their saucers on station at 60 kilometers. It's what Yohan told me. It's about 200,000 feet. They fired the munition. And the three of them stayed on station at altitude. They waited for it to explode. And then after they had enough time to safely go down, one of the UFOs--the Germans' UFOs descended within five seconds down to within 100 feet of the stricken heavy cruiser. The heavy cruiser crew tried shooting at the one UFO with the weapons that were still operational, and they couldn't hit it. So they gave up and went about repairing the ship, so they could limp back to Hawaii.

JAY: And what is an EMP?

RICE: An electromagnetic pulse is an invisible energy field that emanates from a nuclear detonation that interrupts electronics, melts wires, basically wreaks havoc on

anything that's modern.

JAY: So they killed the ship?

RICE: They killed the ship without destroying it.

JAY: As a demonstration of power?

RICE: Yes.

JAY: So you're bringing up this idea that I think it might be surprising to people. And I think a lot of people think that the Antarctic Germans are part of the Cabal, but in fact, they aren't.

RICE: They're not.

JAY: Are they against the Cabal?

RICE: They were very vehemently against the Cabal. And in fact, Yohan referred to them as the Earth's shite royals They didn't like them at all.

JAY: They didn't like the Cabal at all?

RICE: No.

JAY: And they blamed the Cabal for what happened to Germany?

RICE: Yes, following World War I and losing World War II.

JAY: Right. What did Yohan say the Germans on Mars were the most proud of?

RICE: They were proud of not being a part of the Cabal and being able to dictate terms to the Cabal.

JAY: So they liked being an adversary to the Cabal?

RICE: They did.

JAY: There's still a base up on Mars right now.

RICE: Yes. Yes. They sent these messages to all the royal families in Europe. They sent it to the President of the United States. They sent it to the prime minister of Germany. They sent it to the head of the Communist Party of the USSR. And so they were making sure that there was no misunderstanding that what they intended, what they were capable of. And they didn't want the US to say, oh, no, we never got a

message. We didn't get anything. So the cat was out of the bag at this point. The entire world knew what they were capable of and what they were wanting. And they were wanting a formalized treaty.

JAY: And they got it.

RICE: They got it.

JAY: Soon after.

RICE: Very soon after. It took about four years to get the wording right--1954 to 1959--four or five years. And the Antarctic Treaty is the result of those negotiations.

JAY: And what was given and what was taken in these negotiations?

RICE: Well, the non-publicized portion of the treaty includes, again, reaffirming the sovereign nation of the Antarctic Germans. It required the Cabal to provide upwards of 150 to 200,000 people to the Antarctic Germans. And these weren't dregs of society either. They had very specific IQ and physical requirements of people that they wanted.

JAY: And this was in the '50s?

RICE: This was the brain drain of the 1950s and '60s.

JAY: '60s, actually. That's when the brain drain started, around '60, '61. I see. OK.

RICE: Yeah, late '50s.

JAY: Makes a lot of sense.

RICE: 1959. They also increased their requirement from not just senior executives, but they now wanted between one and five board member seats on all the corporations that they had senior executives in. They also required a permanent, lifetime position within the executive branch of each government on the planet that was a Mars German. And so it solidified their positions within the governments. So now, they had people that were within each of these companies. And it wasn't hard for them to work their way up from vice president to president, because they give their people some advanced technologies to take to their companies. And now, they're fast-tracked, because they are these brainchilds that brought this wonderful product--A or B to the table. And now, the company is making a lot of money, so it self propagates.

JAY: Yeah. That's still going on, by the way.

RICE: And it's still going on. Absolutely.

JAY: So was the Cabal worried about these traders coming in and mixing with their people and all that? They must have been concerned.

RICE: They were concerned. But the Cabal took it as--looking at it from the long game. They knew that they've survived for close to a thousand years already through regime change, wars, you name it. They've survived, and thrived, and maintained their control. So they were looking at it from the long game. There were two operations that traveled down to Antarctica during these negotiations--Operation Deep Freeze I and Operation Deep Freeze II.

JAY: Deep Freeze.

RICE: And those were, again, the smokescreen for exploration, where actually they were part of the negotiations involved. One of the Cabal members died of a heart attack during the negotiations out of fear from things coming forward and going public. So they ended up with these positions with a permanent seat in the government. They ended up with upwards of 150 to 200,000 people to be delivered where and when they wanted.

JAY: And where did these people go?

RICE: These people turned into the factory workers--non-desirable jobs that their society didn't want to have. They filled the manufacturing, for housekeeping, any of what would be considered menial jobs that their people were too busy, or doing other things, or didn't want to do.

JAY: So we're in the '60s. Well, the Cabal is doing this kind of--being a double agent. They're acting like they're OK with all of this. But at the same time, they're probably developing everything on their own.

RICE: They were trying to. Absolutely. They were scheming. Again, thinking from the long game, they knew that there was nothing that they could do at that point. And the thought of this information going public was not palatable to them. So the only alternative they had was destruction in order to go along with it. So what they did was they couldn't do anything immediately, because the major technology advantage that the Germans had at that time was the mind wipe technology. Anything and everything that was developed, no matter how classified, was subject, or had opportunity, or there was a chance it could leak. The Antarctic Germans had people in all of these different positions. So they knew all of the advanced technologies that were being developed. That's why you see so many of these classified programs that to the outside world had so much promise. But why did they stop or kill the project? Well, it's either because it was infringing on the Antarctic Germans' technologies, or it was taken over by the Antarctic Germans and moved to their facilities and away from the

public and the rest of the world.

JAY: So it's safe to say the Cabal is also forming a secret space program, or at least they're planning on it.

RICE: They were putting the plans together. But they had to overcome that one handicap that was limiting them--that mind wipe technology.

JAY: And the Germans had to have been way more advanced technologically over the Cabal at this stage, just because they're in alliance with the Draco. And they're getting all this inside info. And they're pretty good at being engineers themselves anyway.

RICE: That's right. That's right. They were able to manipulate and control what technologies got released to which governments. And the ones that they wanted to keep for themselves--they had contacts and people in the governments that would force the programs to be shut down in the budget, because, well, they wanted to take them private. They wanted to move them into their facilities.

JAY: All right. So the Germans now have a base on Mars, a base on the moon. They're in league with the Draco. They're against the Cabal. They're playing a dance with the Cabal, though, even though they're against them.

RICE: That's right.

JAY: We're moving forward now and into the '70s.

RICE: And in the early '70s, that marked the time period when the Antarctic Germans' 25-year first refusal rights with the Draco ended. And so they were able to focus more of their attention on building and more advanced technologies themselves. That's when they started building out their fleet of interstellar ships and crafts. So through the '70s, the rest of the Cabal were trying to bury money through the Space Race program. And make no mistake. At the highest levels, there was friendly communications between the East and West--the USSR and the USA. And they had a common enemy, which was the Antarctic Germans. And so they both used their enormous budgets for their Space Race program to funnel and poor money into these secret projects and which, ultimately, they were wanting to try and build up their own space faring abilities. It still came down to having that mind wipe technology. And at the end of the 1970s, that's when the Cabal moved and actually acquired one of the mind wiping technology wands from the Antarctic Germans. They were able to sneak aboard a shuttle. There were thousands of people across the planet involved. But just like the Manhattan Project, which had over 100,000 people working on it, there were only a handful of people that knew the full scope of it. So same principle here. There were hundreds of thousands of people involved in this project in some way or remote form, but they didn't know what the ultimate goal was. They were a total of five

people that knew the actual scope and goal of the plan. There were three CIA operatives and two KGB operatives. And those three were guarded around the clock until the operation was completed. But what they did was they were able to sneak aboard an Antarctic German shuttle and disable the crew, obtain one of these devices, and then cause a self-destruct on the shuttle, which was probably just a bomb placed on the outside of the fusion bottle, and disintegrated in a ball of gas and fire higher than the sun over the Pacific. Yohan believes that they did a high-low jump--high-altitude, low opening out of the shuttle. So that's how they got their hands on it without having any fingerprints. So it took them three years to reverse engineer that technology. And then, of course, the scientists that were working on it got to be the first victims of the technology in which they were mind wiped--had no idea that they were even involved in such a large technological advance.

JAY: Why were they so interested in the mind wipe?

RICE: Well, because then they were able to assure that their technologies--because they knew they had holes and leaks, and that the Antarctic Germans infiltrated every level of their classified programs. And so they had no means of protecting themselves or being able to develop things in secret. Because the Antarctic Germans knew every project and program they were working on, they were able to manipulate and either kill the project and take it private, or just do away with it. So having that technology allowed them to now have clandestine operations, and programs, and R&D projects, where they were fairly assured that the knowledge of it wasn't going to get out. And so that accounts for the technological advances in the early '80s. It allows--it accounts for the original holes that they started building for Operation Solar Warden. Incidentally, as soon as the device was in the hands of the Cabal, all of but two of the agents that knew the full scope of the program were mysteriously killed, or died, or--

JAY: The five agents?

RICE: The five. All but two. Two CIA agents survived, but lived the rest of their lives in hiding.

JAY: So you're saying there really wasn't a Cold War either. It was like a facade.

RICE: That's correct. That was a means for them to siphon off and funnel money into their black projects or into developing advanced technologies.

JAY: And we've been working with the Russians in secret, then, for a long time?

RICE: Yeah, we have.

JAY: So what's Solar Warden?

RICE: Operation Solar Warden was the Earth's version of a space fleet, in which they were getting into space and actually able to start building holes to further their projection of power out from the planet.

JAY: And this is probably what Reagan was referring to in his diaries where he said that--he then briefed and told there was a space shuttle that could house 300 men.

RICE: That's right. That's exactly what he was referring to.

JAY: So this was late '70s, early '80s that Solar Warden is beginning to be formed?

RICE: That's right.

JAY: So is Solar Warden solely the United States' program or the Cabal's program? Or who is behind Solar Warden?

RICE: The Solar Warden was a United States operation.

JAY: And its point was to emulate what the Germans had already done?

RICE: That's correct--and to try and advance their own technologies and project their power onto other planetary surfaces as well as through our own solar system.

JAY: And did the United States succeed at this?

RICE: They did. They created their own fleet.

JAY: Did the United States have a base on the moon like the Germans did?

RICE: They did. Eventually, they got one. In the mid-1980s in 1986, the Antarctic Germans had been researching and studying. They knew that something was wrong with the shuttle explosion over the Pacific shuttle.

JAY: Right. Where they stole the wand?

RICE: Where they stole the wand. They knew that something wasn't right about it, but they couldn't prove how or who. So it took them eight years, but they did find out how. And it came back to that shuttle. And it took them a little while longer to figure out the who--was. And when they did, they did two things. They sent a message to the two perpetrators--the USA and the USSR. And they moved all of their manufacturing and R&D off-planet to their facilities on Mars. The space shuttle Challenger destruction in February of 1986 was the first message. And the destruction of the cooling towers at Chernobyl in the USSR was the second message. Both of them were done from orbit from an orbital platform. And the Antarctic Germans would have done more, except they were worried about the cowboy president resorting to nukes.

JAY: But they took that shuttle explosion as a precursor to the idea that they had better take everything off Earth and get out.

RICE: Yeah. Well, they knew that the mind wipe technology was out of the bag and in the hands of multiple other countries. And so along with those--the destruction of the Challenger and the destruction of the cooling towers--each of the leaders of the governments of those two countries received a plain brown box. Inside the box was a non-operational memory wipe device with the Antarctic German coat of arms on it. And stamped on the outside was the exact date and time of the shuttle explosion eight years prior.

JAY: Well, it's been an a eye-opening episode here, Jason Rice. Thanks for everything that you do.

RICE: Oh, thank you for having me. It's all about full disclosure.

Reaction to the German Breakaway Season 12, Episode 8

JAY WEIDNER: Hey, Jason. Thanks for joining us.

JASON RICE: Thank you, Jay, for having me.

JAY: Let's get to the 1991 agreement.

RICE: Sure.

JAY: What is that?

RICE: The 1991 agreement has to do with an arrangement made between the Cabal and what is now referred to as the Mars Germans, since they moved pretty much the bulk of their civilization out of Antarctica to Mars. And so what it revolves around is, the late '80s, the Cabal was looking to establish their own lunar operations command, their own moon base. And they ran up against the same problem the Germans had years before. It's all spoken for. So they've got to bribe, pay, or arrange somebody else to give up property. And so the Germans, having their established base there, already had a place that was workable. And so the 1991 agreement between the Cabal and the Mars Germans has to do with the Cabal taking over the lunar base that the Germans occupied.

JAY: Wow.

RICE: The terms of their lease with the Draco were that they were required to have a 100-year lease and that payments for those were already taken care of. So the Cabal didn't have to pay for it, but the Germans did have to find a new tenant. They had moved out of that base. They wanted to be away from the Draco. So with another technology transfer, they got some more land where they wanted away from the Draco.

JAY: On the moon?

RICE: On the moon.

JAY: OK.

RICE: And so the terms of getting out of that lease is they had to find a new tenant. So at the end of the '80s was around the time that Operation Solar Warden was in full

swing and they really needed a base on the moon. And so they worked out with the Antarctic Germans an exchange, again, for taking over the property. This time, the exchange was for the Cabal to provide two divisions, or the equivalent of 24,000 soldiers, for use where and when the Antarctic Mars Germans needed them. In order for the Mars Germans to get out of their lunar base with the Draco, in addition to finding another tenant, they had to provide 10 of their 12 carrier battle groups to the use of the Draco where and when as they needed. They weren't going to destroy them, but the Draco wanted to use them. And whenever they asked what they were going to be used for, they told them border patrol. The agreement between the Cabal and the Mars Germans included the use of the Lunar Operations Command in exchange for 24,000 soldiers. And that is what constituted the beginnings of the Interplanetary Defense and Reaction Forces. There are a total of four divisions of ground troops in that program. Two divisions are wholly and completely manned by Mars Germans. There are no other soldiers in it. Two divisions are mixed and they include soldiers from Earth.

JAY: What year did you finally get into IDARF?

RICE: Started training for IDARF in 1994.

JAY: 1994.

RICE: One of the first.

JAY: One of the first. Tell me exactly what you did for this organization, IDARF.

RICE: Sure. Well, the way that IDARF is arranged, the organization, is that any officer rank 05 and above, which is lieutenant colonel and up through the colonel and generals, are specifically and only Mars Germans. They did not allow any other citizen or soldier to be above the rank of major. So what I did was, along with the other Earth soldiers, is that we filled out the ranks, basically. They were enlisted. They were officers. Being an officer, I was required to be in charge of a platoon, later on as a company XO, as a company commander, as a battalion staff officer, as a battalion executive officer when I was a major, as a regimental staff officer, and then eventually back into the training regiment as a company commander and as a staff officer.

JAY: Taking orders from the Germans?

RICE: Taking orders from the Germans.

JAY: How did you get along with the Germans?

RICE: I get along with just about anybody. Dealing with the German chain of

command was challenging in and of itself, make no mistake about that, because I was from Earth. I was already, in their eyes, handicapped. And so anything and everything that they wanted to blame on Earth soldiers, be it officer or enlisted, they did. And they were petty or some of them were very-- buried animosities that came out, again, because of their extreme dislike of the Cabal. And so we were the next extension of that.

JAY: So why did the Germans allow the Cabal and the others, United States, to form a separate secret space program? Why didn't they just wipe it out before it got started?

RICE: That's a great question and I've wondered that myself. And when I had asked Johann about that, his answer was that they needed the production capabilities of this planet because they didn't have an equivalent manufacturing capability. And also, they didn't have the wide range of R&D available. And so having co-opted all the corporations on this planet, that they had that vast resource that was available to them.

JAY: You keep bringing up the Draco. Why should we be concerned about them?

RICE: The Draco are a group of alien entities. They're highly psychic. They are several hundred thousand years more advanced than we are. And they are also very, very, very negative entities. Their mission, if you will, is conquering, controlling, dominating. That is what they-- that's their MO. And so being able to conquer, dominate, and control the Earth has been one of the goals that they've had. And so by using their proxies, either willingly or unwillingly, they've been able to try and further that particular agenda.

JAY: So the Draco have been around, hanging with us for a while.

RICE: They've been around for quite a while. They're extremely frightening. And part of the training I went through included a number of what would be considered really scary aliens, as far as preparing the soldiers for battling and countering, fighting, communicating. So yes.

JAY: Why don't the Draco just come in and conquer Earth? Why do they do it-- use such subterfuge to rule us?

RICE: That's a great question. And it ties in also with, why didn't they go and dig up this ancient technology themselves? They're signatories to a number of intergalactic treaties that prevents them from interfacing, interacting, or tampering with indigenous populations or their planet. Now, does it mean they follow that? No, it doesn't. They found loopholes or ways around it. And the way that they've been able to do that most effectively here has been through their human proxies and being able to control and manipulate and do whatever it is that they needed to have done. And for the Draco, they needed these fleets of ships and the ground soldiers that came with them, the

IDARF, because for one thing, the human shape and pattern tends to be a common blueprint. And so we look a lot more like the other planetary inhabitants than they do. And so the other thing is that why would they want to kill off their own soldiers when they've got proxies that are willing to do it for them?

JAY: You're trained here on Earth for a while, then you went to the moon and trained, and then you went to Mars and trained.

RICE: That's correct.

JAY: So what was your training like on the moon?

RICE: The moon training revolved around getting us oriented to shipboard operations. Even though we were technically just catching a ride from the canners, we still needed to know the emergency procedures, evacuation procedures, what was the water lines versus power, areas that we shouldn't go in and around, emergency evacuations, firefighting, all the different things that, as a visitor on board of a not so safe all the time spaceship, you need to know what and where and how to go about doing what you need to do.

JAY: And this took place on the Cabal's base on the moon that they had gotten from the Germans?

RICE: That's correct.

JAY: And what was the base like? What was, just like, the buildings like and what was it?

RICE: Well, it was underground. And the one that I was going into, when I wasn't in the underground base, I was on board a ship. They believed in train like you fight. So most of the training that we-- took place and took part in was on board a training ship that they used for this purpose.

JAY: Not on the moon?

RICE: Not on the moon surface itself.

JAY: What were these ships like?

RICE: Cramped. It's about like being on board a US Navy ship. And you go and it's not much room getting through a door. There are bulkheads all over the place from safety perspective, so they can seal off different parts of the ship.

JAY: When you were training on the moon, you were still under the auspices of these

Germans in command?

RICE: Yes.

JAY: I see.

RICE: Still under their command, still under their control and their rules. And some of the moon training included orientation to microgravity operations, getting more familiarized with our battle suits, our combat suits.

JAY: How long did it take you to go from the Earth to the moon?

RICE: Minutes.

JAY: Minutes?

RICE: If that.

JAY: Here's a section from that hypnosis session.

GEORGINA CANNON: Tell me about your first move as a group to another planet, which one it was.

RICE: The first move was to the moon. It was all by shuttle.

CANNON: From where?

RICE: From Area 51. I thought-- [CHUCKLING] We transitioned from the underground base to Area 51. That was our departure point, the Nevada desert.

CANNON: Mhm.

RICE: We flew from there by shuttle up to the Lunar Operations Command, where our next training began. And we stayed there for six months learning about microgravity, learning about pros and cons to each of the systems.

CANNON: Was this taking place in a classroom?

RICE: Sometimes.

CANNON: Where else was it taking place?

RICE: They also had us on ships in space.

CANNON: Oh, in space, OK. What did they look like?

RICE: Triangular, large, smooth sides, wedge-- almost wedge shaped. These were huge.

CANNON: OK.

RICE: Big.

CANNON: OK.

RICE: There were only about 20 something of us left.

CANNON: How many?

RICE: 26 out of the 34. Not all of them died though.

JAY: So after you got done training on the moon, you went to Mars and trained?

RICE: It was more of interface between ship to ground. So it was incorporating the prior two training bases into the new one, which involved departing the ship, how do you do combat drops, what you do for a combat drop, where you go, the different aspects to getting out of the shuttle or jumping out of the shuttle or coming down on the gliders that we used or the anti-grav packs for shooting out, basically.

JAY: Wow, crazy. So what was the base on Mars like?

RICE: Again, most of the time on Mars that I spent was on board a ship. I saw entrances to facilities and that's about all I was able to see. Most of the other time, we were out in the boonies.

JAY: What was it like being on the surface of Mars?

RICE: It's about like walking through a desert with rocks and canyons, and there's an otherworldly presence to it, what looked like washouts, but are depressions in the surface.

JAY: Could you breathe the air?

RICE: We didn't.

JAY: You didn't? You had helmets that had--

RICE: We didn't. Yeah.

JAY: Just makes it easier. Could you take your helmet off and breathe?

RICE: We were told never to, so we didn't.

JAY: Were there other alien groups on Mars?

RICE: From what I understand, there were, but I never saw them.

JAY: Were they fighting or any kind of fighting going on?

RICE: Mm-mm.

JAY: None, never? Everybody lived in peace?

RICE: Everybody co-existed. Whether it was peaceful or not, I never saw it. We were always out in a training area.

JAY: Do you know where they got their water?

RICE: They recycled a lot of the waste and used it for water. I understand that some of the water came from the locked up ice that was part of Mars. But a lot of the supplies that we used were recycled materials.

JAY: You spent how much time on Mars training?

RICE: Four months.

JAY: Four months. Again, we'll take a look at your hypnosis session.

CANNON: Tell me about the time that you went to another planet. What did you do? You mentioned Mars before.

RICE: Yes. I went to Mars after the moon.

CANNON: After the moon?

RICE: To do more zero gravity training, microgravity training, to do more ship ops, to be able to do more-- more ground ops.

CANNON: What did the people look like on Mars, the beings?

RICE: I only saw humans. And we were kept isolated.

CANNON: Oh, OK.

RICE: The Germans had two bases, two cities there.

CANNON: Germans had two bases?

RICE: They were cities, really big ones.

CANNON: What were the Germans doing there?

RICE: Living.

CANNON: Are these above ground or underground, these bases?

RICE: Underground.

CANNON: Underground.

RICE: New Berlin, New Wurzburg.

CANNON: What's above ground, if the bases were underground?

RICE: Radiation shielding, dirt, rock. They have-- they have entrances that reach the surface. And they do have some structures, but they're mostly mechanical.

CANNON: So where did the inhabitants live?

RICE: Below ground. Base is carved out of the rock.

JAY: What did Johann tell you about the Mars base, if anything?

RICE: He didn't tell me much at all. And part of that, I think, is some of his own programming that he's not allowed to talk about because they very closely guard any information about New Berlin or New Wurzburg.

JAY: Those are the titles of the cities?

RICE: Those are the two cities. My unit was the 3rd Panzer Division and they were referred to as the Berlin Bears. When they started their own military force, the Mars Germans, they took over, inherited, copied a lot of the original World War II German units, insignia, symbols, including their uniforms. Unfortunately, our dress uniform, one of them, looked just like the black SS uniform. And the Americans wouldn't wear them unless they were ordered to.

JAY: You spent how much time on Mars training?

RICE: Four months.

JAY: Four months. And at the end, you were finally deployed?

RICE: At the end of that, I was finally deployed.

JAY: Anything about Mars that you can remember that we need to know?

RICE: It's occupied and there are more than just humans there. The Mars Germans have about three million citizens that live on Mars, from what Johann was telling me. That could be disinformation because he was unable to talk about a lot of things. And so the fact that he would be able to tell me that number, I have some suspect to that.

JAY: Is it possible that there is ongoing interactions of a military kind in space between the Cabal and these Martian Germans?

RICE: With 10 of their carrier groups still being blockaded out of our solar system, it explains a lot about the Cabal's activities here. I think that with that many of their units off on operations, it has emboldened the Cabal. I did not know of and wasn't aware of active fighting between the Cabal and the Mars Germans. And that isn't to say that the long-term plans of the Mars Germans aren't to come and try and exert some type of control over Earth. That's originally where they're from.

JAY: Appear to me they're taking a rear guard action to build up their offenses and their weaponry, and that they're going to come back here and try to take over the Earth.

RICE: That's possible.

JAY: Why wouldn't the Cabal be very afraid of this?

RICE: Well, they were terrified of the fact that they had all these battle groups, these carrier battle groups. 12 was what they had at the time that they started sending them out on exercises, long-term exercises. And so that was a huge fear of theirs. And in fact, had the Mars Germans not been required to deploy 10 of their carrier groups, and we very well could have been at war with them because of too many opposing troops in the same space. You can be rest assured that the modern secret space program includes ground forces, even though what we've heard about mostly has been the space portion or the spaceships, or whether it's Operation Solar Warden or the US Navy's SSP, or the Air Force's SSP.

JAY: Yeah, let's talk about that. How many SSPs are there?

RICE: There's a bunch.

JAY: Yeah.

RICE: There's a bunch.

JAY: And this started after the 1991 agreement. Now, after the United States announced to these world leaders that we had a secret space program, they all began to want their own. What countries had secret space programs and what kind of alliances were going on?

RICE: Well, the US version of their space program started off as Operation Solar Warden. At the time that we were building out our original Operation Solar Warden, the USSR was also working on their own secret space program as well. Brazil, Russia, India, China, South Africa, those are some of the other countries that have their own secret space program. They're not nearly as large as the US is.

JAY: Is there a governing body to make sure they don't interfere with each other?

RICE: Not necessarily a formalized program like that. The one common denominator would be the Cabal. The exception to that are the majority of the BRICs countries that have their own independent secret space program. And they've been able to group together into a large enough force that they can't be immediately wiped out by the Cabal's SSP programs.

JAY: What I heard was around this same time period, the people in the Cabal informed all the world's leaders that they had a secret space program. Is that true or not?

RICE: That's my understanding, that they had come forward and come clean because they started building them up in the '80s. And the USSR was well aware of it. And those with more intelligence assets were aware that the US was doing something. And even if they didn't know exactly what it was, they were able to identify the differences between the UFOs they were seeing and ones they were seeing previously.

JAY: Makes sense.

RICE: Yeah.

JAY: And so these other countries then decided that they wanted to get in. Maybe they didn't have the resources of the United States, so they combined and allied with other countries and other forces, or what?

RICE: Yes. And that's a great description of what happened. There are a number of countries, and families even, that are wealthy enough that they wanted and could afford to either develop their own, steal their own, build their own, or acquire their own space program. And that included holes, small ships, small shuttles, to larger ships. The other countries that don't have as many assets available to them have bonded and grouped together.

JAY: So we can say that the military has several different space programs. The Air Force has one. The Navy has one. We know William Tompkins has said that. You are probably, at least initially, part of the Navy one, I would imagine. I don't know.

RICE: That's what I suspect.

JAY: Yeah. And then China has a secret space program.

RICE: Yes.

JAY: Russia has a secret space program.

RICE: They're probably the oldest next to the United States.

JAY: Yeah. And we know that there are various alliances, like the UK and France. And others have the secret space program. Some of the third world countries probably don't have one yet, but they may. You don't know.

RICE: They contribute personnel to allies' secret space programs, but they don't have the resources or budgets for hiding and stealing a bunch of money from their own people.

JAY: We have several secret space programs and they're all competing with each other. And there must be alliances and conflicts and things like that going on, just like every human endeavor.

RICE: That's correct. They have their own agendas. A large portion of what's being referred to as the Alliance are groups that were either hunted down or turned against by the Cabal, that have bonded together out of survival.

JAY: Let's talk about the Alliance. The Alliance is people within the Cabal who don't like the Cabal and don't like what it's doing?

RICE: That's correct. People within, as well as some of those families that may not have the resources, but have a lot of money, financial assets that they can use, that they can then leverage to help or become a part of or buy their way into or assist with the Alliance. Not all of them are as pure as the driven snow.

JAY: No, they're not.

RICE: There's a large number of them that, again, were part and parcel to the Cabal's plans and operations, and were involved with it and had as much responsibility for some of the things that have happened as some of the Cabal. But out of their own sense and need for self-survival, they joined the Alliance. Again, it gets back to the

disclosure requirements that the Cabal has to follow because of their agreements with alien societies for releasing information, as well as some of their own ideological beliefs. Whether it is just a partial screen, half truths, half lies, partial disclosures it's still considered to be a disclosure on their part and puts them in a position of saying, hey, look, we've been telling you this all along. Do you think it was just Hollywood that was making things up? So that they then have the ability, some point down the road, to claim that they weren't lying to us.

JAY: CYA.

RICE: CYA. They will go to any lengths to further their agenda and to protect themselves. They have, of course, Admiral Forrestal apparently locked away in a safe and secured military hospital, who allegedly committed suicide. It was 1949. He wanted to come out. That was right when they were working with the Antarctic Germans. President Kennedy--

JAY: Forrestal was Kennedy's mentor.

RICE: He was his mentor and also by all accounts, a very, very positive individual that was patriotic and cared about his country.

JAY: Went to Germany in 1945 with JFK to see the German technology.

RICE: Yes.

JAY: So he knew. Then he was thrown out of a window at Bethesda Hospital.

RICE: That's right.

JAY: And then Kennedy died in '63. What would the world be like if they would just release these things that you've actually encountered and seen, these technologies? What would the world today be like?

RICE: Oh, the world today would go through a renaissance of new birth, new growth. People wouldn't have to work at jobs they hate and they despise getting up for, but are required to because of safety, security, caring for their family. You could get on a transportation craft and go anywhere in the solar system or galaxy. And say you wanted to go work on the other side of the Milky Way. Well, there's nothing stopping you from doing that. No power bills because every house would have a shoebox-sized power generator that didn't require renewables, that didn't require any input, any fossil fuels. The education technology, some of the technology that they used with us were chair beds that we would lay on. And similar to what's been portrayed in some movies, you just get a download. And it's not like you automatically can spout something. It's more of a subtle and that you can think about, OK, how am I going to

solve this problem, and you know the answer. Whereas before, you didn't have the German language in your mind or another language, or math or any of the science related to it. We wouldn't have to send our kids to these schools to be babysat and to not learn much in the way of a public education. You could sit down in a chair and learn anything you wanted to over the period of an hour. People wouldn't be going crazy. There's going to be some reconciliation required because of some of the crimes that have been committed, but I see these technologies coming out as being an opportunity for humanity to go through a renaissance of growth. That's how I see it, for these technologies to come out.

JAY: You think there is any chance that this will happen?

RICE: Yes, I do.

JAY: Well, I'm hopeful too.

RICE: I'm very hopeful. I have complete confidence in humanity and its resiliency. And that I see the changes that we have been seeing, going back years, but more recently the exponential changes that we've been seeing from people waking up and seeing the lies that they are fed a steady diet of on a regular basis. And when enough people wake up, I think we will see a lot of change and then that's when we can demand full disclosure.

Battle for Planetary Dominance Season 12, Episode 9

Cosmic Disclosure; Battle for Planetary Dominance Season 12, Episode 9

JAY WEIDNER: Hey Jason. Thanks for joining us.

JASON RICE: Thank you, Jay, for having me.

JAY: So we're back on Mars now. You've completed your training, your four-month training. You're probably quite anxious to do something, because two years of training is an awful lot. So what happened at that point?

RICE: Well, the mission of IDARF was to provide troops resources, to provide defensive capabilities to other planets that were under either direct current or imminent threat from an invasion by an alien species. And so we were real excited about being able to go and try and help these people. My first deployment was to be referred to as Area 26. I was a platoon leader, and my first mission was to take my platoon and move into this city and to gather intelligence and information that we would be later using to help them form a defensive plan, come up with objectives for resources they need to save and stockpile, and areas that we could help them on for defense. But our first mission was to reconnoiter the city, find out what kind of social arrangements they have, how the city's laid out, how it's set up, what kind of technologies they were using. There's a lot of information that we just didn't have. And so these were the initial stages before the planetary governments went public with, hey, we've gotten help. We're about to be invaded, and these are the guys that are going to be helping us.

JAY: Was everything as you were told when you were deployed there? Or were there deceptions?

RICE: Oh, there were deceptions. Make no mistake about it. The deceptions that they used for us, number one, is that the same group calling the shots with the IDARF fleet were the same groups that were providing the alien invasions and that that was their means to get their foot in the door as they required a planetary population to declare a single government. They required that government to invite them in. They required that government to allow them to establish a financial system, again, means of control, means of manipulation.

JAY: So you're saying the people that were commanding IDARF were also funding the alien invasion.

RICE: The Draco, that's correct.

JAY: The Cabal also must've started raising their own armies just to make sure they had at least equal amounts with the Germans, right?

RICE: Well, they had the fallback kill switch that they had as a last resort, if they needed to. But you're right. It doesn't account for the other 24,000 soldiers that the Germans did provide themselves.

JAY: You mentioned the kill switch.

RICE: Yes, that has to do with the failsafe that the Cabal built into the 24,000 soldiers that they provided to the Mars Germans. It is a special code within a particular nanite enhancement that provides suicide of the soldier at the, basically, push of a button. And included in that are the munitions that are hidden onboard the ships. Now those work out to a distance of about 500 light years, so the ships may be 1,000 light years away. But once they enter that zone of within 500 light years of Earth, then it would be transmitted through the ship's transmitters or the retransmitters that are included with the units.

JAY: And would it dismantle the weapons onboard or?

RICE: It would cause each of the soldiers with that nanite enhancement to die, as well as the explosion of the anti-matter munitions that they've hidden.

JAY: We're going to get into the suits and the technology in detail in a future program.

RICE: They're absolutely amazing. The abilities that soldiers have from these suits--they're ballistic-resistant. They have servo controls and electro motor controls built into them for enhanced strength--jumping, running, you name it. They're self-sustaining so that you could be in the worst environment--deadly, toxic--and still survive, up to and including space that all the radiation, the heat, cold, anything. They're absolutely amazing suits.

JAY: OK, so Jason, you went to a planet. I'd like to know a little more about this planet, like were there humanoids that lived there?

RICE: The inhabitants of this planet were humans. They were a little bit smaller than the typical Earth humans, average height being about five feet, which is one of the reasons why I was able to blend in. So I'm not much taller than that. But their size was equivalent to a healthy human. It was just they were a little bit smaller. The flora and fauna--they had a lot of trees that resembled pine trees, pine needles. We called them near pines. They had forests that were full of near oaks, rivers, streams. There's a

greater prevalence of fresh water as opposed to Earth, which is covered mostly by saltwater.

JAY: Did they have different races?

RICE: This planet had different races. They were light-skinned, dark-skinned. The predominant race were lighter-skinned, kind of like an olive Greek or Mediterranean.

JAY: And eye color--same thing? Different eye colors?

RICE: Different eye colors, different hair colors.

JAY: And what do they eat?

RICE: They ate fruits, vegetables. They did not eat livestock or meat.

JAY: They didn't.

RICE: They were a heavy seafood diet, if you will. The first town that I was deployed to was right on a very, very large lake, freshwater body. And it was large enough that you couldn't see the other side--many, many, many miles, probably the size of the Gulf of Mexico.

JAY: And do they have an industry, or was it mostly farms and agriculture?

RICE: No, they had mixed industry. They did not have a financial monetary-based economy like we have here. Their economy was based on bartering for services and goods. It was more of a clan or a guild-based system that they used. And so our first mission was to find out as much as we could about the people that we were going to be helping.

JAY: Were they a warring people or a gentle people or?

RICE: They were not warring. In fact, they hadn't had wars or fighting in centuries, by the time we'd gotten there.

JAY: So this alien invasion must have been shocking to them.

RICE: It was. It was very shocking to them. They were not prepared to circle the wagons, so to speak.

JAY: Do they have weapons?

RICE: No, they did not.

JAY: They did not have weapons, so they were, really, in some ways, bad shape.

RICE: They were in bad shape. And we were set out to, first, figure out what kind of civilization they had. We didn't know if they were guild-based. We didn't know if they had money. So we had to first find out, so we told them we were from far enough away, but we brought trading goods that were equivalent to what they were using at the time for trading. And we were wanting--our goals, we told them, was to set up a trade mission of some type to exchange goods from one city to another.

JAY: Did you learn their language?

RICE: I must have learned it before we made planetfall as part of the programming that I received.

JAY: So we have kind of a gentle people living on a planet somewhere, and did the aliens invade before you guys arrived?

RICE: No we arrived well enough in advance, so we thought, that we would have time to prepare.

JAY: So you had intel that told you the aliens were coming.

RICE: Somebody had intel that thought that they knew when the aliens were going to arrive, when the invasion was going to happen, roundabouts. Usually, it was within a month or two was the target that they gave us.

JAY: But you've also said that the same group that was behind the aliens was the same group that was behind your forces.

RICE: That's correct.

JAY: But you didn't know that then.

RICE: Did not know that at the time.

JAY: That was something that came as a surprise.

RICE: There would've massive revolts soon.

JAY: So you arrived on this planet, and the first thing you do is you're just going to do intel, gentle Intel to find out what the landscape is like.

RICE: Blend in.

JAY: Blend in.

RICE: Become members of the city for a period of three to six months.

JAY: OK, and no military or--

RICE: No military. Dress like they do.

JAY: And the aliens are on their way.

RICE: They're on their way. We had planned on getting there a year in advance, so we would have time to blend in, to find out, to scout, to gain information, gain the trust.

JAY: And what would be the ultimate end of this intel gathering?

RICE: So that we could tailor the defensive systems and the methods based on what they had, the way that they did things so that we could blend it in as seamlessly as possible.

JAY: Did you guys like these people?

RICE: Yes.

JAY: You did.

RICE: We did.

JAY: Yeah, everybody liked them.

RICE: They were all very likeable. Their society was based on very open. There wasn't checkpoints. There weren't any real heavy questions doubting where we'd come from. They were very trusting, a very friendly, very open society. People were helpful.

JAY: Was there a culture--music, art?

RICE: Oh, yeah. Art, culture, music. They had their own artwork that they decorated the city with, whether it was--they didn't have any motorized vehicles. The cities were generally small enough that 800,000 were about the size of the city that we first went to. And right at the edge of where the city ended, it was forest. And so they only expanded as they needed to grow, and it was interesting to stand. You could stand on the dividing line between wild forest and urbanized area. There was not really any suburbs. They built out as much as they needed when they needed to.

JAY: The aliens that later attacked--what were they like?

RICE: The aliens that later attacked--those were the werewolf-like aliens. That's what

we had termed them to be, as they were a cross between an eight-foot tall hominid with quadrupedal, two arms, two legs, except they had hair and fur and larger ears. They had a shortened snout but lots of teeth. If you can imagine something that's terrifyingly scary, that is what we were looking at.

JAY: Is it possible that somebody on Earth got a hold of DNA or something and was trying to make these creatures?

RICE: Well, knowing that these creatures were split into two classes--they were the soldier class and the commander class, and you couldn't tell any difference between them physically. It was just the level of intelligence between the two. The soldier class were a lot like drones, directed and ordered, and then they would go without stopping or thinking about their own safety. And the commanders were the ones that were calling the shots. It's possible, since they were a created being for the purposes of invading this planet, that that same DNA or that same pattern was brought and repeated here.

JAY: You specifically said that these werewolf creatures were created.

RICE: Yes.

JAY: What do you mean by that?

RICE: Well, we believed at the time, and knowing now what I know, that they were an artificial creation of some sort, because they didn't have the same type of biological makeup, once we got a chance to examine them and Intelligence had a chance to provide a report back to us, because we were very interested in finding out the most efficient areas to aim for, essentials. So in finding out that there were more mechanism-type parts and components than there were tissue or organ-type parts.

JAY: Ah, so a combination of machine and--

RICE: Biological, yes.

JAY: Why would these creatures want to invade such a peaceful world?

RICE: Don't have the slightest idea. We didn't know what their ultimate goal was, except that they were looking to take over the planet and kill the inhabitants. That's what we were told. And that's, essentially, what we saw from their actions.

JAY: So what was the first thing that happened in this war that really you knew now this was going to be--

RICE: This was real. This is it.

JAY: Yeah, this is it. Something--they must have done a first invasion.

RICE: There was. The first realization that it wasn't just a training exercise anymore was when I was at that city that we had first gone to, and I'd been there a couple months. Me and the rest of my platoon--we'd spread out over the city in different houses and taken up local jobs to try and blend in, working for some of the local restaurants or shops or carts and moving things and hauling things. And so we'd started integrating with the city to try and build up the relationships with the locals. And one day--this happened to be my day off- the city was well interspersed with canals, everything from a few feet wide to a few hundred feet wide. A lot of their methods for moving goods around the city was by the canals, because they were able to put a lot more on a barge and move it under manpower than they were on a cart of some kind. So the place where I was taking my early evening meal was right next to a canal. The beach was a couple of blocks from where I was, and I noticed, first off, something was off, because there were people all going towards the beach and towards the bridge crossing, the major canal between the breakwater and the mainland. It was just something out of the ordinary. It definitely wasn't normal for a group of people. And I asked them, somebody walking by, what was going on. And they told me that something was falling out of the sky. So I'm like, what? I was very curious, and so I got up and started walking towards the beach across the bridge, and that's when the first sonic boom hit. A lot of the people that were already on the bridge walking were shocked and stunned by it. You'd see them duck down or start to react. I ran out to the observation deck that is on the breakwater structure, and I ran towards an area, because I still didn't have a clear view because of trees and buildings. And when I got to the clearing, I saw it.

JAY: What'd you see?

RICE: It was some type of meteor that was coming down. I was able to dial in my enhanced vision a little bit to get a better picture of what it was. And that's when I saw what was actually coming towards the lake.

JAY: Which was?

RICE: It was a modified impactor that had been fitted with a very crude heat shield to prevent it from breaking up, and it was on its way towards landing somewhere out in the lake.

JAY: A spaceship disguised as a meteorite?

RICE: No, it was a kinetic energy weapon. And what they use is they will take any large enough sized rock that they can find in space, fit a really crude heat shield to it so that it doesn't break apart, and then launch it towards the surface and the areas that they want to try and strike.

JAY: Right, like using a mass driver to push it.

RICE: Exactly. It was a mass driver, just a large piece of mass that builds up enough kinetic energy that when it strikes, it doesn't have the messy side effect of radiation. But it certainly has enough fusion and explosion, concussion and heat that it causes a tremendous amount of damage.

JAY: And you knew that this was artificial, because you saw the heat shield.

RICE: That's correct.

JAY: Had you been briefed earlier about this possibility?

RICE: I'd been briefed earlier about this was one of their MOs for opening salvos is that they would soften up the surface by launching kinetic energy weapons.

JAY: And when this thing hit, what happened?

RICE: Well, before it hit, I was in momentary shock, and then training took over. I had communication with the rest of my platoon, and so we had already established protocols for quick signals. Within a few characters, we were able to transmit an entire message. So I was able to send that out to the rest of my platoon to let them know, hey, we've got an impactor on the way and to follow our SOP plan for what we were going to do, which is get to high ground, store and secure the equipment, and watch your six. So--

JAY: Watch your six?

RICE: Yeah, watch your six.

JAY: What's that?

RICE: Watch your back.

JAY: Watch your back.

RICE: After I sent the signal, there were a number of people that were out on the observation deck. And so I was concerned with getting them off, because I knew that if that struck the water, which is what it looked like it was going to do, we would be inundated with a very, very large wave. And so I wanted to try and get as many people off as I could. And so I started talking to the crowd and trying to get them back towards the mainland without scaring them into a panic. And I was able to get a large number of people to start moving, and then more people started going away as well. And we were almost back across the pedestrian bridge when it struck and lit up the

entire sky behind me. It was enough that I saw the light, and then I knew that the wave was going to be coming soon. And so the impact was enough to get the rest of the crowd and people running. On my way back, one of the local kids had started talking to me, and I directed him to get back across, get to the mainland, find high ground as quick as you can. And I knew that it wouldn't be long before we got hit by the wave, so I started running with the rest of the crowd. If I hadn't, I would have been run over. And I made it about a block away from the canal, and I turned and looked back towards the breakwater in time to see most of the structures there disappear from the wave. And it was just like watching buildings disappear.

JAY: So the concussion was so large that it was literally destroying buildings.

RICE: It destroyed the buildings out on the breakwater.

JAY: Wow.

RICE: And it was coming right for us. And I knew I needed to get someplace low--a ditch, an alcove, something so that--or else I'd be killed with it. And I found an alley and started running down an alley, and along the back of one of the buildings, and crouched in a corner as quickly as I could about the time that the freight train hit and started taking out the building that was right above me.

JAY: The concussion wave.

RICE: The concussion wave. And I could see clearly from there all the way to the coast. And I could see parts of buildings in the canal, and I could see bloody, dusty people moving around or getting up from underneath stuff. And moments before the streets were filled with hundreds of people, they were all gone, disappeared. I needed to go check the quarters that I was sharing with a couple of other members of my platoon and see if I could go ahead and grab the emergency gear or anything that was left in case they didn't make it out with it and to check and see if any of my unit were still there. And so I ran down, got into the building that we were staying in, which is a couple of houses down from the intersection, found a first aid kit in a backpack, and I started making my way, running up towards the hill, which was another block away when the waves hit. And by that time, I was far enough away from the coast that its energy had been dissipated some, but it still made it up to my chest before I was able to get to a point where I was safe.

JAY: You did get to safety, though.

RICE: I did.

JAY: And did they fire any more of these weapons at this point?

RICE: No, I found out later they were aiming for the city. But the problem with unguided kinetic energy weapons is that even if you're off half a degree, you can be off by several hundred miles.

JAY: Right.

RICE: And this one missed its target by 50 to 75 miles, thankfully, or else we'd have been incinerated.

JAY: It would've killed everybody.

RICE: Killed everybody.

JAY: What do the people of this planet do at that point?

RICE: Well, we had to step up our plans for organizing and arranging and coordinating at that point. Part of the operation involved cleanup, and afterwards, I lost a few members of my platoon that day. And part of the company commander's complaint--he was a Mars German--was that he believed that there was more that I could have done to save my soldiers and also commented, since I cared so much about those effing civilians, that I could stay without reinforcements and help clean up in the aftermath. I should have been worried more about my platoon, which there was nothing I could have done. And my platoon sergeant reinforced that for me and said that if I had done what the company commander had suggested that I wouldn't have survived probably another month.

JAY: So you got stuck on this planet for a while.

RICE: Yeah, I got stuck doing cleanup work without reinforcements as a punishment for helping the local civilians.

JAY: Did any meteors hit anywhere else on the planet, or is this the only one that hit--

RICE: There were a series of them that went into different places on the planet. They were trying to attack.

JAY: So the planet has been hit all over the place.

RICE: Yes.

JAY: You probably knew more than the civilians of the planet.

RICE: We did. We had more of a handle on what was going on. Again, general public weren't aware yet that they were facing an impending invasion.

JAY: All right, so then what happened?

RICE: Well, part of their MO we'd been briefed on was that they would also bombard the poles with kinetic energy weapons deliberately to melt polar ice, which, of course, raises the sea level, which anybody with oceanfront property ends up getting flooded. Luckily, the city we were in was on a lake and not part of the oceans, so ours weren't as affected by that as some of the other areas. There were areas that were on the ocean that ended up being under 20, 30 feet of water. I remember seeing parts of the city that were--it's all under water. And it's just eerie silence. Nobody. You couldn't find people up on top of buildings that had survived. But unfortunately, the water levels hadn't risen to a point where it wasn't receding yet, and so after the attack, there were large portions of the city that were left uninhabited, because the population just wasn't there. And the next thing that we had to worry about was, what do we do for food? And then we have to help the city organize and get themselves food and fed.

JAY: How long did this war last?

RICE: We were on planet for 47 months.

JAY: Wow, almost four years.

RICE: Almost four years.

JAY: And we're going to get into this war, but I want to go back to something you said earlier that I think is important. And that is you said that you later found out a faction was funding both sides of this war--your side and the werewolf's side. Who was this?

RICE: A Draco.

JAY: The Draco. For what purpose?

RICE: They eventually wanted to gain control of that planet.

JAY: Resources?

RICE: Resources, slaves.

JAY: And so they were creating a war that would be what? A diversion. What was the point of having a war, though? I mean why didn't the werewolf creatures just invade and take over?

RICE: Well, what they wanted is they wanted to have a planet that was mostly intact. They wanted a population that was not able to fight back. They needed to be invited

in, which was our part. And they allowed us to go and offer assistance. And as part of the conditions for that, we required them to have a single government, a one world government so that it was easier to coordinate and organize and arrange. So as part of--

JAY: The Draco wanted this?

RICE: The Draco wanted this.

JAY: Same thing with the financial situation? They wanted to stop the bartering and the guilds and--

RICE: Set up that method of control, yes.

JAY: The Babylonian money system?

RICE: Yes.

JAY: Interesting. And the reason they're doing this is because it's easier to control the population?

RICE: That's correct.

JAY: I see.

RICE: It's easier to control those that are desperate, and when you've got in a war that has mostly destroyed a planet, you have a people that become desperate. They're desperate to survive and to carry on and to live. And so when you've got somebody that's in that position, they would pretty much get anything and everything they wanted, which was to turn over control of the planet to do whatever they needed them to do in order to help them to fight off the invading force.

JAY: So we have a very peaceful planet. Why did they want to attack these people?

RICE: Well, another one of the MOs that I noticed was that we never went to any planets that had more advanced technology. And they always ended up sending us to planets that were industrial age or less on the technology scale. And the reason is that if they stood a chance of being able to repel the invasion themselves, then we weren't needed.

JAY: So they are weak by the nature of the fact that they hadn't advanced yet.

RICE: That's correct.

JAY: So you thought that your presence was benevolent?

RICE: Yes, we thought we were there to help these people defend their planet. And we didn't think of we were there to enslave the planet for somebody else's control. We were briefed and told countless times that our purpose and our mission was to go and help local populations defend their planet from alien invasion.

JAY: Well, it's been a real pleasure talking to you today, Jason. I thank you for coming forward.

RICE: Well, thank you for having me. This is all about full disclosure.

JAY: Thanks, Jason. Thanks for watching.

Advanced Weapons and Combat Tech Season 12 Episo 10

Cosmic Disclosure; Advanced Weapons and Combat Technology
Season 12, Episode 10

JAY Weidner: Hey, everybody. I'm Jay Weidner. And today, we're continuing our conversation with Jason Rice. Hey, Jason.

JASON RICE: Hello, Jay. And thank you for having me.

JAY: Today, we're going on a different vein of thought here, in particular, your experiences with weapons, technologies, the incredible spacesuit that you had. So let's start out with the simplest. What was like, your basic outfit that they gave you to fight these wars?

RICE: Oh, sure, the standard uniform consisted of, you know, BDUs, a battle defense uniform. So it was a digicam pattern of green, forest green, dark green, grays, whites.

JAY: Digicam pattern?

RICE: A digicam pattern.

JAY: Are you saying that the suit itself was a digit projection?

RICE: The pattern on the material is a heavily pixilated pattern, is what that means.

JAY: Could it be changed?

RICE: It could. It could be changed. We had uniforms that were part of our standard issue that were holographic uniforms, in which we used for blending into the background. You couldn't see a person wearing one of these uniforms, unless they moved it. And then it was a very slight blur of the background image. It supposedly concealed our infrared signatures, our radio signals, any of the outputs that we had. Thankfully, the quantum entangled communications systems with our nanite enhancements were not picked up. And so those were, you know, didn't pose a problem, but the holographic uniform systems that we used out on combat operations, especially in planet one posed a problem, because once you got more than two of them in a location, the enemies could localize on it, and were able to find us, even though we were invisible.

JAY: Right.

RICE: But it had a helmet system that included all of the holographic camouflage

systems so that, you know, basically, the soldiers and uniforms alike would disappear.

JAY: So when you say holographic, it would be like just the samples, the background?

RICE: It's not that it is projecting what's behind, so much as it is creating a field that is slightly out of phase with the dimension, this existence. If you can think back to the Philadelphia Experiment, in the relocation of the naval ship, they phased it out of this existence to make it disappear.

JAY: Right.

RICE: Well, this is a progression of that technology down to a man-size unit, so that it wasn't a complete phase out, but it was a partial phase out, enough of a phase out that a light was able to pass through. And so the person appeared to disappear.

JAY: Well, that would give you great advantage I would think.

RICE: An incredible advantage.

JAY: What was it like walking around being invisible?

RICE: We had some fun with it. In fact, the when first learning how to use it back at the FIG--

JAY: Right.

RICE: --some of the really stealthy people could get close enough that they could blow on your ear without you ever knowing that they were there. It's an incredible tool and unbelievably helpful. The other thing is that if you know what you're looking for, you can see the phase difference show up. And you'd be able to see it if somebody is moving, and that included using them while airborne, as well as during drops.

JAY: So I mean, if you have this technology down to a level that it can make a single man invisible, then there must be these cloaking devices on ships too.

RICE: Yes, if they are able to miniaturize it enough down to an individual person, and seeing it on other vehicles, some of the larger transport vehicles for equipment and materials, as well as some of the tanks, some of the other APCs, they have them all the way down on anything and everything that they need to have disappear, they can use it. Now, that also means that it's also available for those in other SSP programs, which includes cabal, which includes certain members of corporations, certain members of the elites that want to have access to that. They can have access and use it, which is what's used on some of the aircraft that are flying around our skies this

very moment.

JAY: Former Naval engineer, Bill Tompkins, told me that if they turned off their cloaking devices, you would see the whole sky full of ships.

RICE: All over the place.

JAY: Yeah. So that's amazing.

RICE: Yeah, imagine what a surprise that would be.

JAY: What other things did this suit offer you besides invisibility?

RICE: This particular modification was targeted specifically for the holographic invisibility.

JAY: Did you have enhanced strength with it? Or did it have any protection capabilities?

RICE: Not in addition to the normal suit capabilities, which were already very high.

JAY: What does that mean?

RICE: The standard combat suits that we had was based on several systems that had to be working in concert with each other. The underlying system was a base uniform, in which over all of the surfaces there were a multitude of what appeared to be seams specially woven together. They are what's called a triboelectric material, which is a polymerized organic material overlaid with a conductor. And the benefits of this is that--and this technology is out there now--the benefits is that it not only generates electricity when you move, but it also provides feedback from the body as a sensor system. So any time you'd want to move your arm, it would notice that you're moving your arm, and the powered armor would move, because if you didn't have that feedback system on the inside, it would be like trying to--a medieval knight, walk around with 150 pounds of armor on his body. It's going to be really cumbersome and slow. And you'd only have the extremely athletically fit and muscular guys are the only ones wearing it because they're the only ones that can carry it around. So this system allows the close interface between the line system, the liner, and the powered armor.

JAY: And it did protect you?

RICE: It did protect us.

JAY: Must have been a certain limit of what kind of weapons it would protect you

from.

RICE: Any small arms fire, any conventional rifle.

JAY: They'll bounce off, or be absorbed, or what?

RICE: Depending on where it would hit. If it was on an angle, then it would bounce off. If it hit dead on at close range, then it would impact and absorb into it.

JAY: Would you be hurt at all by this, bruised or anything?

RICE: You could be bruised if it hit in the right spot.

JAY: Right. So it could sting you.

RICE: Yeah, yeah, you'd know you've been hit.

JAY: Right.

RICE: Not only would the--because the feedback systems include--because, you know, if you're wearing armor and somebody is plinking at you, you may hear it, but where is it coming from? You know, you're not going to know. So the feedback system on the inside also gives you a physical stimulation in the areas that you're taking shots.

JAY: So if I shot you and the bullet your suit, would your suit know where that bullet came from?

RICE: It was also tracking the ballistics of that, yeah.

JAY: So you would now have a record of where that bullet came from--

RICE: Originated from.

JAY: --and you'd be able to take out that whatever.

RICE: Yes, at the push of a button, you could fire a fire and forget system that would be a gravimetric grenade that would be able to launch itself from a concealed position to find where that shot came from, because you'd already have it triangulated from the last known position anyway.

JAY: How about Central Command? Would they also have this information coming in from the suit?

RICE: They would have it, as well as all of your buddies. So if 15 guys down the line

takes a shot, and it happens to be closer to you, all that information is shared amongst the combat computers. And there are three in each combat system. There is one on the inside at the chest level. And then there are two in the back. And it's at the lower area of the spine, out of the way as much as possible, so it provides you a triple redundant system. So all of the systems update each other and communicate. And it's important, because the visors, you don't have any glass or openings or much to like you see in Hollywood with the fancy eye. There's none of that, because those are weak points for ballistics that allow for a point of entry. So it's a solid shield in front of you. Anything that you're seeing is all digitally generated.

JAY: Wow.

RICE: So anything that you want to see--and you have full vision of the combat, combat field through smoke, through night, through enhanced environments, reduced environments, microgravity, environments that are off planet. And some of the training we did on Mars was involved with harsh environment training in a suit. Most of the four months I spent on Mars was what we called life in a suit, because we spent the entire time training in the suit.

JAY: At first, it was uncomfortable, naturally.

RICE: Oh, it was terrible.

JAY: Yeah. How much did it weigh, the whole suit, the helmet and everything?

RICE: The whole suit was about 200 pounds.

JAY: 200 pounds?

RICE: Empty.

JAY: You're kidding.

RICE: No.

JAY: I mean, you're dragging 200 pounds around on you?

RICE: Well, you're not dragging it, because it's powered. So it feels like you're not wearing anything. I mean, it's just like you're wearing a jacket.

JAY: And how is it powered? Is there a battery pack or?

RICE: It has its own battery pack power supply. And it is an anti-matter power pack system. And it's a triple protected redundant system. Clearly, if one of them fails, you don't want to be anywhere near it. But they do have a lifespan that lasts about a week

between power cell changes.

JAY: Right.

RICE: And that's at full combat. And you know, at first, we were like, yeah, sure it lasts a week. I don't believe it. After living through it and seeing it, you get confidence in the systems. The self-contained breathing system is very similar to a rebreather system that you'd see on a scuba, in which it takes the same air. And it may inject a little bit of new, but most of the times it's scrubbing. It has several modes of operation, where you can run in complete self-containment. You can run with outside air being filtered. You can run with unfiltered outside air. There's a number of different ways that it has its own systems. It can recharge its system, if for instance, you're in a pressurized atmosphere, and you don't want to use your self-contained oxygen, then you can switch to refill mode, in which it will start the process of trying to refill the tanks, the onboard tanks that you've got. So that when you go into say a zero-g or an out of atmosphere condition, you have full tanks. And we could set it up. In fact, that's what I did, and most of us did, was set it up for automatically going through these processes for maintenance, for recharging, for reminding us, you know, hey, look, I'm going through this recharge process. OK, and then you move on.

JAY: Did the suit interact with your own nanites?

RICE: It sure did. In fact, the communication protocols that we had, part of the learning process that we went through with the nanites involved the communications. And you didn't have to talk in order to communicate, but what it did require is focusing on a particular spot to enable that communications. And it was a particular spot in the brain that you focused on. You don't think about it when you're talking. It's an automated process, but the same thing happens when you're communicating with somebody, and talking to them.

JAY: So you're saying you're almost telepathically commanding the suit?

RICE: Well, the communications, for instance, in calling higher and reporting a combat, or talking to them to get resupplies, we had to learn how to use that communication system. And for me, that was not an easy task, because you have to focus on that one spot. And then you have to turn down all of the other thoughts and focus just on the words that you're going to communicate. And so in the beginning, it's kind of like getting an auto-correct inappropriate text.

JAY: Right, the error message.

RICE: It puts the wrong things into your text that you don't want. Well, the communications were like that. You know, and the last thing you want is to be sending the equivalent of a mental text to command that has just how you feel about

your commander in the text.

JAY: Right.

RICE: So we had to learn how to control that, and not send extraneous information in the message stream.

JAY: Interesting. Do you think they're using this suit technology in the military today?

RICE: I think in special access programs, you bet. Without a doubt.

JAY: There could be somebody invisible walking around even here right now?

RICE: Sure.

JAY: Wow, that's scary.

RICE: All over the planet, it's kind of scary.

JAY: Yeah, it is.

RICE: But, you know, they still have rules that they have to play by.

JAY: Right.

RICE: And I'm very thankful for that. But yes. Are they in the conventional military and being used in the conventional military? No, because we still have that whole elite separation thing, is we've got all the good things, and you're not allowed to have them, because we're special and you're not.

JAY: So the weapons, are they connected to communications within the nanites within you, and the suit itself?

RICE: Some of the weapons are neural command. Some of them are physical commands, or physical initiations. There are a wide range of weapon systems that we used in the SSP program. My unit, the third Panzer division, we had anti-matter explosives. And I wanted to go over a little bit more on anti-matter, because the first article that I could find publicly about the modern military using anti-matter was in 1986. That's the first article that I could find out in the public view. I mean, if you recall, that's the year that the message was sent to the cabal by the Germans, when they found out that their mind wipe technology was stolen.

JAY: Right.

RICE: Very shortly after that article came out, orders came down to that company on that base, and incidentally, a lot of the research was being done at Eglin Air Force Base in Florida.

JAY: Right.

RICE: There was a sequester of information that came down, no more talking about it. OK? So '86. Anti-matter, to give you an idea of the power, the reason why it is so energetic is that every gram of matter has an equal and opposite gram of anti-matter. The beauty, if you will pardon the expression, of an anti-matter explosion is that the mass of both the matter and anti-matter is 100% converted to energy. Now, what does that mean? To give you an example, conventional modern nuclear weapons only operate at about a 10% efficiency.

JAY: Right.

RICE: The largest nuke in the United States's arsenal only works at about 10% efficient, 10%. Anti-matter explosions operate on a 100% efficiency rate. The little boy bomb that was used on Hiroshima, it was about 10 feet long, weighed about 10,000 pounds, 28 inches in diameter, and it was 15 kilotons. The amount of anti-matter needed to generate the same amount of explosion you could get out of the size of a number two pencil eraser, half a gram would generate the same amount of 15 kilotons of explosive power.

JAY: Did you have like a projectile that you could shoot these things with?

RICE: Well, the way--the problem with anti-matter is that anything that comes in contact with it--

JAY: Boom.

RICE: --boom. You know, modern nuclear weapons are fail safe, because the amount of technology required just to get the plutonium or uranium to detonate--

JAY: Reach critical.

RICE: --reach critical mass is a tremendous amount of technology.

JAY: Yes, it is.

RICE: It's got to be fired all at the same time. We won't get into the physics.

JAY: Extremely difficult to build a nuclear bomb.

RICE: It's really hard to get it to go off. And so it's a very fail safe weapons platform,

modern nuclear weapons. Anti-matter is just the opposite. It's a fail dangerous proposition, because any time you come in contact with anti-matter and matter, it's going to get the explosion. So it means that it has to have some type of magnetic containment.

JAY: I see.

RICE: You can't allow it to touch anything. And to give you an example, 50 billionths of a gram of anti-matter is enough explosive power that's equal to about 4,000 pounds of TNT. That's how much was used on the Murray building in Oklahoma City.

JAY: Right.

RICE: To give you an idea, 50 billionths of a gram. And so even amounts smaller than you can see are significant. And so what they have is they've developed a anti-matter containment that does not require power, that is essentially a stationary magnet system. And the ones that we had--

JAY: And they're very small.

RICE: And they're very small. And in fact, if you were able to open it--

JAY: You wouldn't even see one.

RICE: Yeah, if you were able to open one of these containment systems up to look for the anti-matter inside, you wouldn't see it, because they're microscopic. So the systems that we used were--we called them Cheerios, because they were little toruses, real small. And so it had a very specific amount of anti-matter in it.

JAY: So the containment system's like a Cheerio?

RICE: A torus.

JAY: A torus, and was it going around?

RICE: Oh, they were stationary. They were static.

JAY: Was it inside the hole?

RICE: It was inside the hollowed out--

JAY: So sort of like a centrifuge or something.

RICE: Yes. And so they were able to contain the field.

JAY: Was it racing around in that thing? Don't know.

RICE: Don't know.

JAY: You ought to open one and find out.

RICE: Not the hard way. These containment systems had to be cracked at a very specific point in order to get them to open. And it was on the inside seam of the inner torus. You could step on it. You could hit it with a hammer. They wouldn't open.

JAY: Nothing.

RICE: The containment wouldn't breach. If you activated it at a very particular spot, that would breach the containment and allow the anti-matter to come into play.

JAY: So there was a geometry that you had to activate.

RICE: Yes. And there was a certain way that it had to be--the containment had to be broken. Then, once you break it, then boom, you get the magic that anti-matter is.

JAY: So you would like fire this thing and then it would--when it hit the thing it would break open?

RICE: Well, we didn't use them as projectiles.

JAY: You didn't?

RICE: No.

JAY: Were they like grenades?

RICE: We used them as stationary, or emplacement grenades, or bombs. We used them in mortars. We had them in artillery rounds. We used them for--

JAY: I see. So you'd lay out a bunch of mortars knowing if they were advancing at you.

RICE: Land mines.

JAY: Mines. And then--

RICE: Yes.

JAY: --as they step on it.

RICE: Command detonation, motion activated.

JAY: Gotcha.

RICE: So that was how. We didn't have the technology to redevelop and redesign it into a projectile. If we did, we would have.

JAY: Was that the first time that you saw the anti-matter technology?

RICE: I had seen it during training.

JAY: Yes.

RICE: And had used it and tested it and had been able to set some off to get experience with it. They want you to get experience, and to gain confidence in their containment systems, because when you're going and all you need is something the size of a number two eraser to create a 15 kiloton nuclear explosion, people are a little worried, you know?

JAY: Want to be very careful.

RICE: Be very careful. Well, one of the first things they did was they brought it into the classroom and hit it with a hammer, the Cheerios, to show us look, these containment systems are solid. You have to hit it at just the right place at the right amount of pressure.

JAY: I'm not hitting one with a hammer.

RICE: I'm pretty sure, at least later when I was training, it was a dummy unit, but I'm pretty sure that it wasn't a live unit, but it got the point across, is that look, these things are pretty tough. You're not going to be able to break them open with just your bare hands. But the use of anti-matter at that particular time on that planet, was what turned it for us. We had more advanced weapons systems, some of the more advanced gravimetrics.

JAY: What's a gravimetrics?

RICE: It's a great question. If you can imagine accelerating the gravity within a field up to several thousand gravities, what would happen to an object?

JAY: It would get very heavy.

RICE: It would implode on itself.

JAY: Yes.

RICE: And so what we have were crew served weapons that shot a one inch diameter beam that did that. And so any biologicals that it came in contact with would essentially, implode from that point.

JAY: Sort of like a black hole, a little miniaturized black hole?

RICE: Yeah, that's a good way to think of it.

JAY: So it sucked everything into kind of a dimension.

RICE: It would cause it to self-collapse.

JAY: Right. All the atoms and molecules would--

RICE: Yeah, anywhere that it would pass through.

JAY: In a single point.

RICE: At a single point. And so, you know, those were crew served weapons, again, something we weren't allowed to use, but we weren't allowed to use it. They were too afraid, because they are crew served weapons. They are man portable. They could have fallen into the wrong hands. And they were too afraid of that kind of level of technology. So they held them back and used them on strategic division defensive perimeters, or areas that they kept a tight close watch, in which there were no indigs allowed. Those were areas that they--defensive positions that they were allowed to use them in.

JAY: Again, to hide the technology from the indigenous.

RICE: That's correct.

JAY: OK, so what did it look like when one of these went off? Did you witness one?

RICE: Well, you can't see the beam, but our nanite enhancements allowed us to attune to the right frequency. There are two settings. There's the first setting, which fires an infrared beam that allows you to see where you're shooting, similar to the infrared beams that they have on modern and conventional weapons that you can see with night vision, but you take the night vision off, you can't see a thing. Very similar to that.

JAY: Use them in Iraq and Afghanistan.

RICE: That's right. That allows you to see where you're shooting without anybody else seeing it. This system uses that infrared beam as a sighting, so that, you know, instead of a visual laser, they use an infrared laser.

JAY: Right.

RICE: And we all had the ability to tune into that frequency, so we could see it.

JAY: Right.

RICE: And so you know, other people, other humans, other soldiers, civilians, they couldn't see that, unless they had night vision. And that wasn't a technology they had. The second stage of the weapon was the actual firing of it.

JAY: And you had night vision in your suits also?

RICE: It was built into our nanites.

JAY: So you guys were awesome.

RICE: But you know, since you can't see with your eyes, it was built into the suit as part of the sensor system.

JAY: Right. You have the first setting, the sighted.

RICE: The sighting, and the second setting is the firing.

JAY: Right.

RICE: There was a certain amount of time that you had to wait in between shots. You could get two or three seconds shot off, and as many targets as you could hit in that time. And then you had to wait--

JAY: Did you use conventional weapons at all?

RICE: Yes.

JAY: You did?

RICE: We did.

JAY: So bullets and--

RICE: Mm-hmm. Standard chemical projectile weapons.

JAY: Right. What percentage did you use of those weapons as opposed to these exotic weapons?

RICE: We used the standard conventional weapons because, you know, again, our interactions with the indigs was to train them.

JAY: Right.

RICE: And so 99% of the time, we were using standard conventional weapons, which were the chemical explosives, projectile type, either gas fed, gas recoil. There are a couple of other systems that I won't get into.

JAY: Did the suit protect your hearing from these conventional weapons?

RICE: It did.

JAY: That's nice.

RICE: It did. That was nice. I had it built in. They toned it down a lot, so you'd hear the pop.

JAY: Yeah.

RICE: And you were able to get to a point where you could recognize different sounds and different weapons.

JAY: Sure. Did the suit help you with recoil?

RICE: It did, number one, because you're adding a couple of hundred pounds to your mass.

JAY: Sure.

RICE: So you know, as a 150-160 pound adult male, you're now 360 pounds with the suit on. And so you're not going to be seeing or experiencing nearly the same amount of recoil.

JAY: Right.

RICE: The standard issue weapons that we had were the plasma rifle and what we called the Gauss rifle, which are electromagnetic coils. Pulser rifles is what we called them.

JAY: Right. What are those like? What do they do?

RICE: The Pulser is not really expressing what comes out. That is an expression of the pulse of magnetics down the barrel. And you can find information on this type of technology conventionally.

JAY: It's like compressed plasma?

RICE: No. What it is is the Pulser rifle is a series of coils along the barrel.

JAY: Yeah.

RICE: That is powered by a extremely high amperage battery that fits into the handle, advancement materials, advanced science. It has a clear crystalline structure. And it's filled with a pink liquid.

JAY: Right.

RICE: We weren't on a need to know as far as the materials and how it was made, and don't break them.

JAY: And when these pulses would hit whatever, what would happen?

RICE: Well, what would happen is the specially designed rounds that went into it, both we had pistols and rifles, those rounds were about the diameter of a number two pencil lead. They were sharpened at one end. And they were hollowed out. They were made of a non-corrosive, magnetic material.

JAY: Oh, so they would actually--the pulse would shoot out a physical--

RICE: Ballistic, yes.

JAY: --object.

RICE: It would send out an object at incredible velocities.

JAY: Wow.

RICE: I mean, like partial fraction light speed.

JAY: Really?

RICE: So I mean, you could turn it up, but we had to dampen them down. And they were governored, so that we didn't--

JAY: They're too damaging.

RICE: --launch things into orbit. You know, they didn't want the Navy to start taking shots from the ground. So they had them governored down to a more manageable velocity. The science behind these particular rounds was that we had a standard round and we had an enhanced round. The standard round, upon impact it would compress

and mushroom, which something the size of a number two pencil became something the size of a 38. So it was more than enough. And they generally had enough velocity that they would pass clean through. So they were damaging enough. The enhanced rounds, if you can imagine a miniature umbrella, from the outside they don't look any different than the standard rounds, but when it hits, instead of mushrooming down into a mass, the umbrella opens up.

JAY: It opens up as it's traveling?

RICE: When it hits.

JAY: Oh, I see.

RICE: When it hits.

JAY: So it's activated when it hits.

RICE: It activates--

JAY: --and bores a hole I guess.

RICE: It opens the umbrella, because if you think--if you're pushing an umbrella aerodynamically through the air, and then when it hits then the umbrella opens up from the impact. And even though the tissue or armor is going to push back on that umbrella, it's still large enough that it creates enough damage that's equivalent to like a 50 caliber.

JAY: Wow.

RICE: So I mean, it is devastating. And again, these things are accurate out to several thousand meters.

JAY: Is this the weapon that you were using when you were first fighting the werewolves?

RICE: No, they wouldn't let us use that either.

JAY: They wouldn't let you. Nice.

RICE: That would have been the absolute best thing to use, because we could use those in our fully automatics. Same thing on the next planet, Paladus 3. It would have been a game changer.

JAY: But they weren't interested in that.

RICE: They weren't interested in that.

JAY: Pulse and a plasma, is there a difference between a pulse and a plasma?

RICE: There is. The plasma rifle is based on a different concept. It utilizes magnetics and magnetic coils, but what it does is instead of ejecting a projectile at very high velocities along a barrel, it projects a small, spherical piece of metal. If you can imagine a very advanced material BB, would be a good equivalent for it. What it does is, inside the unit, the magnetics heated up to a point, where it is glowing. The next process is it purges the barrel with a noble gas, nitrogen, so that this now glowing almost on fire ball doesn't catch fire in the barrel. So as soon as this ball comes out the end of the barrel it's on fire. And oh, by the way, it's now moving at a very high velocity, as well. So you get these fire balls that you're able to shoot that are basically molten lead. Being able to shoot a plasma ball, that's why they call them plasma rifles.

JAY: Devastating.

RICE: Devastating. Devastating. And the high rate of speed for the rate of fire, nothing, nothing conventional compares to either of them, as far as what it is capable of doing and how quickly it can lay down metal.

JAY: Wow, sure wouldn't want to be at the receiving end.

RICE: You don't want to be on the receiving end of that. There are more weapon systems that we can go into. The question is, do you want to--I think there's probably one more that's worth discussing.

JAY: Go ahead.

RICE: The last one is what was referred to as the static gun, the CONPDDP, C-O-N-P-D-D-P, a condensate phase difference diffuser platform. And what it was is it resembled one of the old television cameras. That's what this thing looked like. It was about the size of a small freezer, about four feet by three feet by 2 1/2 feet, multiple edges and ledges and cooling fins. This thing was powered by its own power system. And what it did was it created an area in front of it out to about a half a mile. This system is only limited by the amount of power going to it. And what it does is it causes anything within its path to lose cohesion at the atomic level. It basically reverts everything and anything back into its native and original components.

JAY: So it disintegrates it.

RICE: Disintegrates it. Anything that is a solid, anything that's a gas. We called it the static gun, because part of the interface with the beam itself and the air is it caused the air to of course, disassociate. And the process was a very low static sound. Another

byproduct was light from the beam. The beam itself was a 10 inch diameter beam. This was a divisional weapon. This was not something that was man portable. There were only five of them in my division. And one of them was a preserve, and the other four were for divisional defense, which means that the main general's headquarters were defended by this unit.

JAY: This was the ultimate defense.

RICE: Yeah, there was no armor. There's nothing that was capable of stopping it. The Navy had even bigger units, even larger ones that were capable of longer distances and larger diameter beams.

JAY: How far away could it hit something and do damage?

RICE: Technically, there is an infinite distance. You're only limited by the amount of power that you had to feed it.

JAY: And the curve of the planet, I guess.

RICE: Right.

JAY: That is fascinating. I don't know how anyone can say that this could be made up. I suppose somebody will, but the attention to detail that you present is amazing.

RICE: I suspect that there will be those that probably accuse me of that. I'm just not that creative.

JAY: No, and neither am I. Anyway, Jason, it's been really a pleasure having you on, talking about the cool suits and weapons that you used. Thanks.

RICE: Thank you for having me. And I'm really looking forward to expounding on it again in the future. And this is all about disclosure.

JAY: It is. Thanks for watching.

Medical Devices of the Future Season 12, Episode 11

Cosmic Disclosure; Medical Devices of the Future Season 12, Episode 11

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host George Noory, and I'm here with Emery Smith. What about medical devices of the future? Emery, welcome to the program.

EMERY SMITH: Thanks for having me, George. You have good experience in medical technology--what are the medical devices of the future?

SMITH: The next evolution is most likely going to be an app in your iPhone. And the iPhone will be like a SCENAR. And it will also be like a CAT scan. So you could put it on your breast and you can zoom in, just like you zoom in on your pictures, all the way to the cellular level. This technology already exists. It's just a matter of time before it comes out.

NOORY: Will it tell you your arteries are blocked, go get some help right away?

SMITH: Right. It'll do things like this--it can scan your body 400 times better than a CAT scan. You can zoom in all the way into the cellular level and say, well, look at these 10 cells. They're cancer cells--they're tumorigenic cells. Push a button, send the frequency, and zap those--never happen now.

NOORY: So you mean we'll be curing ourselves?

SMITH: We'll be curing yourselves, for sure, in your back pocket if you've got a phone.

NOORY: Now, wait a minute. Hospitals, doctors people who are making money--the pharmaceutical industry--do you think they want this to happen? A cheap little handheld device that could attack illnesses?

SMITH: I can assure you they don't want anything out that fast. So it will be a gradual display of the technology coming out. Maybe this thing will only be used to spot it, not cure it. And then, you have to go in and get your therapy done for that--whatever the treatment is they want. So it will be a very slow release of this type of technology. And my goal is to get this out to the world right now within the next

NOORY: Absolutely.

SMITH: And it's just a very dangerous thing. You're going up against these very large

corporations that have their own militia and that will threaten you. And I've been threatened in the past many times--as you know--with the medical devices. So we have to incorporate these corporations for now, incorporate the government into ways of getting the technologies out in a safe way.

NOORY: Well, look what happened to Royal Rife and devices like that. They chased this poor guy and hounded him until he died.

SMITH: It's very tragic. And this is happening all over the world even today, unfortunately, with brilliant scientists, and inventors, and engineers. The thing is to get a structure built of an organization that can expose this stuff through clinical trials and things like this and do it the right way because that's the protocol we're in. So we have to follow these protocols and do it the right way so we don't step on feet and people are not killed.

NOORY: What are nannite technologies?

SMITH: Well, nannite technology is--on a nano level, there's ways to make very small synthetic cells and robots that can go in the body. And a good example of an archaic one is the camera that you swallow and it records the entire time--

NOORY: Inside, all the way down.

SMITH: --going through your digestive system. So that was one of the first things. But they have things that go into the bloodstream the same way, but on a very small level.

NOORY: All hooked into a computer?

SMITH: All hooked up to a computer. And it runs through your whole bloodstream. It's made of an organic material so it does break down over time.

NOORY: It dissolves, you mean?

SMITH: It dissolves. So this is where it's going. So they can get an accurate depiction of what's going on in your body. The main thing is, we don't really need to do that because the technology exists right now in our compartmentalized projects, where you lay on these tables and your body is scanned. A 3D holographic image is now projected above your body. So the scientists can move it around. Zoom in like I was talking about. And these three dimensional holographic images are very, very--

NOORY: They're crystal clear.

SMITH: Crystal clear. Just like I'm looking at you. But now, it's a holographic image

of your entire body cell by cell. So I can grab your body, move it here, open it up before I operate on you and see what's really going on.

NOORY: Can these little nannites be hacked by somebody who's sitting at another computer?

SMITH: Yes. Anything to do with nannites that are--because they're electrical and they run off the body's own electrical system--believe it or not. It actually powers them. Anyone could hack into there and kill someone. You could be injected with these things. And could also be used for really bad stuff, too. In projects, George, we were able to clone people. And they have a residual memory locked into their DNA where these clones would remember who they were in another past life.

NOORY: And they look just like the body?

SMITH: They're exactly the same.

NOORY: Wow.

SMITH: But what's interesting is they retain--and this is the big study going on now is--how the heck are they growing these clones--even if they're artificially put in a woman and gestated that way or if they're grown in a vat--how the heck do these clones remember who they were? Answer that question. So there's an energy signature in the DNA that they're trying to crack that is like a hard drive that never forgets about where it actually came from. So if it does get to become an adult or a teenager, these clones do remember and recall certain aspects of the life they had before. And sometimes this happens to people on planet Earth where they're having a recollection and think they were reincarnated.

NOORY: What's fueling this? What is pushing this kind of technology?

SMITH: I believe, like China just came out publicly--they're growing humans because of the need for organs. And it doesn't need to happen that way because we have 3D printers right now that can print with your DNA, we can print your liver. We can print your heart. And then, activate it. Send a charge through it and then put it into your body. These are healthy cells. These cells were grown with your DNA very quickly. And this is all suppressed technology that's actually been around for quite some time. They're starting to grow 3D print bodies and activate them. They're having a lot of problems with it. It's not exactly perfected, but they're doing it. And it's being suppressed from us. When we have this technology right down the road, where we can print you a liver.

NOORY: The technologies that you worked on, what were they like?

SMITH: Well, they're kind of set up like an operating room. They're seamless. And everything is inside the walls or in the ceiling. So there's even--if I'm operating and I don't have an assistant, these robotic arms will come down from the ceiling and someone can actually be helping me from very far away. And this is now technology they're using now in open heart surgery that in the early '90s, it never existed.

NOORY: That was it. Exactly.

SMITH: And also, while working with different types of frequencies of DNA and ET bodies, you also had to use special instruments because some of our instruments and devices would actually destroy the tissues. So you had to be careful with the components that you were using--the different types of metals, the different types of plastics, and things like this--when you're taking samples and biopsies. The neat thing about the med lab that was in the programs was this amazing table that you could lay on. And it--like I said earlier--it will your whole body and we could see if there was any contaminates in you. If you had any tumors or anything like that. But the table itself to also--like the Rife machine--shoot frequencies in your body to realign what needed to be fixed. So in the future, I do believe these tables will be in everyone's homes because you don't need to do anything. It can actually fix you. Stop bleeding. Enhance the broken bone into healing within hours.

NOORY: You just lie on top of it and let it do its thing?

SMITH: You just lie on top of it. And through energy and frequency, it actually heals you and cures you. These fiber optics drop down out of the ceiling for getting a sample out of the body--it actually is like an assistant that knows already what needs to be done. These tentacles will come down and firm up. They could be so hard that you could use it as a spear and punch through you. They can actually lift the body up and turn it for you--these tentacles. Or if you want just an appendage out, it can support the appendage off of the table. Or if you need it closer to you because of magnification problems--things like this. And it's all voice activated, as well. And it's all intuitive, very kind of knows that you're going to be in this body. You're going to need to see this part of the body. And it does it. And like I said--it's very strong. These fiber optic cables--I'll call them--can lift the body up, turn it around. Rotate it back and forth. It also can project through these little holographic images on what you're working on. And it's overlaying on top of this, an image of the bone, the tendons, the ligaments are all shown with light holographic on top of where I'm taking it. And it shows me exactly what biopsy to take from what part of the body. It's kind of like an AI--artificial intelligence. The programming of this stuff--you have to understand--is light years ahead of us. And it's reverse engineered. You have to understand the table will know what is wrong with you. The table will know what part of the body to fix.

NOORY: So the future with these devices, it's absolutely astounding.

SMITH: Oh, it's amazing because this is where it's going. If it's already here now in these compartmentalized projects, it's just a matter of time before we get it. Hopefully, sooner than later.

NOORY: How long do you have to lie on the table?

SMITH: It depends on what your problem is. We're you just in a car accident? Are you treating some ongoing cancer? Is it just you have a tension headache? So all these factors go into the treatment of how the table would like to fix you. I don't know the programming of it. I don't know the specifics. I don't even know how the frequencies work. But I have seen people on these tables getting cured and healed. And a lot of these things are also up on the space station's that are up there right now.

NOORY: Will they ever enhance the power of telepathy and psychic abilities with technology?

SMITH: Well, right now, they're doing that with supplements--as you know. You hear about all these supplements. These things--what they do is they allow the body to access different points of the neural receptor sites so you can start using these parts of your brain that you've never really used before. So you have this increased cognitive function. You have this increased remote viewing capability. You have this increased psychic abilities--all of our patients are telling us. And it's all because of activating certain parts--whether it's through frequencies or supplements that contain frequencies.

NOORY: There's a study at Stanford University where they were able to work with the genome sequence. And people were able to enhance their contact ability with extraterrestrials. It's truly bizarre. What can you tell us about something like this?

SMITH: Well, it just says someone goes and meditates. You are changing your frequency and your genome sequence. You're getting activated, too, when you go out and do close encounter of the fifth kind protocols. You're accepting this energy that's coming from either an extraterrestrial location or from space. So the thing is being aware that you are capable of almost anything and then, focusing on that and allowing your body to be activated. You hear about these meditators going well, I was activated. Activation of the genetic code is a very serious thing that's going to be proven more with science--like they just did with Stanford with this. So I completely agree with that. It was used in the projects a long time ago for the super soldier program. And also, for the remote viewers, where they were doing this activation for the genetic code. And it was working--whatever they were doing.

NOORY: What is driving the technology, Emery? What is fueling it to make it grow so quickly these days?

SMITH: We are fueling it. The civilians of the world are fueling where it's going to go. And how fast it's going to go there. Because we're the ones buying these products. We're the ones that are watching us. That's why they hire all these amazing people to go into Walmart and say use these colors. Put this here on this shelf.

NOORY: Play this music.

SMITH: Play this music. So this is kind of a control factor because it's guiding us where they want us to go. But that's not where our hearts want us to go.

NOORY: Emery, we've been talking a lot about the medical technology that you specifically have been involved with. What else is out there?

SMITH: Well, there was a really interesting--going back to the table, again.

NOORY: You love this table.

SMITH: Oh, I love the table, but the table is just one aspect of the entire unit. And what that means is there's these fiber optic cables that come out very small--maybe less than a millimeter in diameter or some up to 3, depends on what they're doing--and they have the ability to come down to the body. Attach to the body. Scan the body. And they do it all with light. It's all photons. And they can actually shoot photons into your body at a very atomic level that I can't explain--I'm a physicist--that allows the body to regenerate itself. And what that means is if you can regenerate your body, you can kind of, almost live forever--if you know what I mean.

NOORY: Will the body do that on its own? Like a lizard grows a tail, will we ever be able to grow a finger with that kind of technology?

SMITH: Well, yeah, that's what I'm getting at. You can regrow limbs or you can 3D print a limb. And these are the technologies I was exposed to while I was in there. The technologies out today--which is interesting--is like the four states of water. There's some sort of energetic properties of this plasma water where we were able to grow back fingers, just by soaking it in the water three times a day.

NOORY: Gosh.

SMITH: So this stuff is out there, but they can't talk about it. And they're not going to write white papers on it because it works too well. So I think light therapy is going to be the newest thing because there's a way to cure the body just by using different types of wavelengths of light. Like, there's another device out there that was in the projects that just came out and this was an IV catheter that has a light on it. Many different colors of light. There's red. There's blue. There's green--I think. And you can stick this into your antecubital vein and as the blood goes past this light, it activates

the DNA. It activates things in the DNA to allow you to be even more psychic. To allow you to be more healthy. To allow you to fight infection. In the nucleolus when the DNA passes through the light, there's an activation. And then, the frequency changes and it's like--it's a catalyst. The entire body now is at this different frequency. And many things are happening now in your body that you're not used to. Your hearing improves. Your sight improves. Your sense of smell--we lose about 1% of our sense of smell every year as we get older. Which really affects our taste. If you can't smell, you can't taste. So all these things are enhanced.

NOORY: Are we talking about technology like that that will continue to get better and better and better?

SMITH: Right. See, they're using this on the surface of the skin. And what happens if you put that light inside the body? So that's what they're doing. They're allowing the blood to go through this. And even in the projects, there are special lightrooms where you just go in this room. You sit down very comfortable in these nice chairs, kind of like recliners you see in the dentist. And you go through this series of light therapy. You have to wear special goggles because the light is very, very bright. It looks like all white light, even through the goggles that are tinted. But it's not. It's a color spectrum of light, but it's so bright of that color that it permeates your entire body. So it doesn't give you a suntan or anything like that, but it somehow allows it to affect the blood below your skin.

NOORY: Energizes it, somehow.

SMITH: Yes. And the light is so bright it actually passes a little bit through the dermis and into the bloodstream.

NOORY: There is a gland in the body called the pineal gland--is there anything technologically that could stimulate it to do what it does?

SMITH: In the projects, working a lot with this pineal gland, they have a harmonic type of device that they can basically, attach to it through your sinus cavity. And it does a very quick, low frequency vibratory harmonic tonality. And it somehow breaks up the calcium and the minerals that have been collecting there--almost every human being, almost every human being has a calcified pineal gland so you know. But there are devices like that are out there that they have used in the projects to help stimulate this. And it's just a matter of time before you'll be able just to put something here and then, allow that frequency to go in to clear that up. And it'll be like breathing, again, after not breathing your whole life.

NOORY: Is there anything technically that would enhance telepathic communication with us?

SMITH: Well, that's part of the pineal gland, too. It's an eye of not just seeing, but it's also, activating different parts of the brain. Sometimes the brain wants to use that gland for things, but it can't because it's blocked.

NOORY: Can you enhance it?

SMITH: Right, so it's a short circuit. So this would enhance that--correct. This device would actually enhance the ability for the brain and the pineal gland to work together.

NOORY: Stenosis of the spine is horrible for a lot of people. What does the future hold for something like that?

SMITH: Well, there's a doctor named Dr. Scuderi who invented the alpha-2-Macroglobulin concentrator--which I've used many times, and I think that's a fantastic adjunct to stem cells and platelet rich plasma--it's a protease inhibitor. It's a protein that's only in your plasma. And he was able to extract this protein. And they're using it now for arthritis by injecting it into the facets and into the back to decrease the inflammation so the body can heal itself. There's a side effect that's going to be coming out that they did a study on with a2M and we've been able to regenerate pretty much anything in the body for a very long time.

NOORY: That's today, but what about tomorrow?

SMITH: But we've never been able to anti-age--that's where I'm going. So this protein has shown significant amazing capabilities to actually anti-age tenocytes in cells. So what that means for us in the future is we might not be lifting our hands to get aspirin or Motrin anymore for our inflammation for the pain in our heads. We'll be grabbing this alpha-2-Macroglobulin protein that's already viably available in your body. But they're making a synthetic recombinant protein to this so they can distribute it, of course. And you never know--you might be going in to get a a2M infusion which is going to set you back 10 years.

NOORY: See, I think technology is amazing. Even now, you go to your dentist and he gives you a filling. They put a light on the filling to make it harder and quicker. It doesn't burn your mouth. It's not hot. It's not cold. It's nothing. It just somehow solidifies the material. Is this ET technology?

SMITH: Yes, it is. It's reversed ET chemical technology. And we were using this in the projects with the super soldier programs. If one would break their femur, we could wrap this type of cement putty around them and then, activate it with the electricity. And now, it's completely sealed and completely ready to actually bear the same amount of weight or more. It increased bone density. So these things are out there that are not allowed into the civilian arms yet. But you're absolutely correct. It's slowly trickling out.

NOORY: What does the future hold for this kind of technology? Is it going to get better for us? Or is it going to be used for military purposes? What's going to happen for it?

SMITH: Most amazing devices developed in the military and developed in the compartmentalized labs, usually takes a few years to a few decades to be sold to a regular civilian corporation for it to be distributed.

NOORY: And marketed.

SMITH: And marketed. But this has happened. And all of the stuff that you see today is actually stuff, of course, the government and compartmentalized projects and corporations have been using for decades. So think what they got today, George. If we're already getting this really cool stuff right now released this year, but we're still like, 20, 30 years behind. It's like when they build these stealth fighters. You don't really hear about it until--

NOORY: But that's exciting for the future.

SMITH: It is because we're going to--

NOORY: I can't wait.

SMITH: I can't wait because I don't want to have to go the hospital if I don't have to. If I could do this at home and do it cost effectively so everyone has one of these devices.

NOORY: And it works.

SMITH: And it works. It's proved to work.

NOORY: Remember the "Star Trek" shows, where Bones, who was a doctor, of course, used a device that he waved over people that were on the ship and they got cured. That was an incredible device that Bones used, wasn't it?

SMITH: Yes, and it wasn't too far-fetched. There's a similar device that we have out now by LET Medical called the SCENAR device. It's a new type of frequency healing. And the device can send in these frequencies in the body and it can actually help reprogram the nerves and reprogram the voltage of things that are wrong in your body. Such as if you had a headache and you put this on your body. It knows and sends a frequency through your whole body and says well, this is not aligned up right here. This is a tension headache. It can send a frequency in to relax that muscle. So there's technologies out there today that have been out for a while. And it's interesting because it's been illegal in the United States of America forever. But yet, a lot of the

astronauts in Russia and overseas have been--it's standard issue to have one of these with you.

NOORY: Oh, they swear by it.

SMITH: So you take this up with you when you're at the space station. It's on every space shuttle mission and things like that. So they recently just got the authorization now, I think in Canada--a long time ago if you were to order one of these into the United States of America, they would confiscate it and change out the circuit board so it would just be a TENS unit.

NOORY: Which gives you a pulsating electrical--

SMITH: It's just a pulse, yes.

NOORY: It's good for your sore back.

SMITH: Right. Exactly. And so it's sad that this was happening, but this thing can actually help cure diseases and help cure ailments and things like that. What I'm saying is that technology is here. And there's more technology coming out.

NOORY: Emery, with the faith healer, they use energy that they grab from the universe. It goes through their body and they project it into the individual they want to heal. Does this device work like a faith healer?

SMITH: Well, no, I don't believe it amplifies your own energy, but I do believe it helps regulate the voltage in your body using frequencies so your body can actually heal itself. It's all of these bombardments of these lights and EMF fields and all the foods we eat. And, of course, the radiation from the sun that ages us, destroys our cells, and things like that. So it's important to know that the body is really good at regenerating itself if it's at a nice homeostasis well being. If it's at this neutral state, it can do amazing things to heal itself. But your body is always fighting. All day long, you're fighting the viruses you picked up on the plane. You're fighting the bombardment of radiation and EMF fields. It throws of the frequency of the DNA. Faith healers are using their own energy--their frequency--and pulling in energy from around them. Our DNA is a crystalline structure which is full of frequency and energy. So we're always emanating energy. Some energy levels are high in our bodies. Some are low. Maybe this organ has a low energy. And maybe this organ has a high energy. But it has to be at a certain voltage of energy and frequency for it to operate efficiently.

NOORY: What does the SCENAR device look like?

SMITH: The SCENAR our device looks like what Bones had. It kind of looks like a

small iPhone. And it's a little thicker than that. And it has usually, three little metal prongs on the bottom end of it. And they're very expensive--$8,000 to $15,000.

NOORY: No, that much?

SMITH: Yes. And there's courses now that they're giving here in the United States and Canada for people to learn these. So I think it's a very important piece of survival equipment for anyone to have because we also need to start treating ourselves. We need to be the physicians of our own body. We can't have a regulation of big pharma telling us or the American Medical Association programming physicians well, step one, this. Step two, that. If this doesn't happen, now you do step three.

NOORY: Do just wave it over the person or they physically have to be in contact?

SMITH: You physically just run it down the body on the skin gently so it is touching the body. It has to measure the current of the body. So it's picking up the frequency and the voltage of the body.

NOORY: A lot of people believe that there's suppressed technology out there. That governments are holding back from letting us know it's out there.

SMITH: Well, it's a good example of ozone therapy. It's been proven to highly oxygenate the body and kill cancers and things like this. And the FDA would not approve that. It's just recently that a few states now are approved for that, but it took 20 years for that to happen. Same thing with stem cells and platelet-rich plasma. I had the same problem when I came out with my patents. The problem was I was going about the wrong way. I was saying well, I'm treating this and helping cure that and trying, again, to prove it. You can't do that. You have to say, well, this thing concentrates cells. And give it to the physicians and say, well this may or may not help you. You can try it out and let me know. And then they come back with all these side effects. Well, it healed the wound twice as fast--did you know that? No, I didn't, but can you do white paper for me and let me now? As a device manufacturer, you have to be really careful when you come out with these amazing ideas because you have to go about it and register it a very certain way or the FDA will just shut it down.

NOORY: Emery, should be on "Cosmic Disclosure." Amazing material.

SMITH: Thanks, George, for having me.

NOORY: This is "Cosmic Disclosure" with our guest, Emery Smith. Thanks for watching.

Salvaging Ancient Alien Technology Season 12, Episode 12

Cosmic Disclosure; Salvaging Ancient Alien Technology Season 12, Episode 12

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host George Noory and I'm here with Emery Smith. And we will be talking about space salvaging in this episode. Emery, welcome back to "Cosmic Disclosure."

EMERY SMITH: Hi, George. Thanks for having me.

NOORY: What the heck is space salvaging?

SMITH: Well, just like we have ships out here in the ocean that salvage wreckages, there is a huge event going on in atmosphere and exoatmosphere in our surrounding solar system. And what that is, is the constant daily activity of craft going up and salvaging space junk.

NOORY: Huh.

SMITH: And not just space junk that we have put up there, but space junk that has been here for millions of years of downed craft, bodies, devices.

NOORY: Who's going up there taking it?

SMITH: We're going up there collecting it, the human civilization. The corporations have contracted out major rocket entities to send up these craft. Now there are space stations up there already with these technicians and mechanics that are up there all the time. And they are collecting this material and putting it on these capsules and sending it back down to Earth where we retrieve them from the ocean and take it back to our laboratories and study whether it's fibers or metals or composites or bodies even.

NOORY: It's space junk though, isn't it?

SMITH: Space junk, just like junk here, still can be used, recycled, and we can learn from it. Because a lot of this stuff is not made on Earth, it's not from Earth. There's a lot more of that just floating around. The whole system is full of this space junk that's just floating around. Some are craft that have been damaged or exploded.

NOORY: Old satellites that have died, right.

SMITH: Yeah, old satellites and things like this that are not of Earth origin, by the

way. Many drones have been found as well from extraterrestrial civilizations that are up there that just didn't make it.

NOORY: The president has proposed Space Force. One of the missions will be to continue the salvaging of satellites that are up there.

SMITH: Right. Eventually this will just be a civilian operated entity that's going to be public and not be so clandestine. But right now, it's just reserved for the people who have the money to collect these items and to come back and reverse engineer them and use them for products. I mean, the whole thing with this Space Force, I kind of have to giggle at it. Because that's been already going on, as far as I know, since 1990. So for them to say, well, we need $14 billion or whatever it is to make this Space Force. Kind of like the secret NASA, you know, was already doing all this stuff way back in the day. Which regular NASA has no idea. You know, that's just a cover up, you know. So I think what's going on here is to get the American people to support this with their tax money is to say, well, now we're going to have a Space Force. We have already had the capability to launch missiles from space, you know, like I said, 20 years ago. We already have high powered laser beams to shoot down at the Earth and shoot into space.

NOORY: Sure, we've seen that.

SMITH: There's new satellites going out there that have very high powered telescopes and tracking systems that can track objects deep within our solar system. So we know where every piece of debris is and whether it's moving under its own steam or not.

NOORY: There's been talk that there's a satellite called the Black Knight satellite. Might we be also looking for that?

SMITH: I don't know too much about that. I don't study a lot of the pop culture stuff that's online. I just know that there are devices like that out there, very large craft that have been downed. They're just floating around space. Some are in orbit around the moon, around other planets nearby, around the sun. So they only come around every now and then, but they are in some sort of elliptical orbit. And daily things are coming near the Earth where they can go out and see what this giant thing is. Is it an asteroid? Is it is an abandoned ship? And they go out there and they do the best to get these things.

NOORY: Emery, you've talked about space stations being up there. What else is up there?

SMITH: There are other stations that are up there and stations being built today around the same size, just a little bit different. And these are housing technicians and scientists not only for the removal of all the salvaging, but also to control different

types of satellites that are a little bit farther away. We actually have satellite drones that can maneuver around the solar system now--

NOORY: Wow.

SMITH: --that these people are controlling. But it's easier for them to do it up there for some reason than to be on Earth.

NOORY: What kind of corporations are involved in this kind of work right now?

SMITH: All the aerospace scientific corporations. I won't say names, but--

NOORY: But we know.

SMITH: You guys already know them. And they also have sub-entities under them. And they make sub-corporations under these corporations to make it look like they're not really with that corporation. It just depends on what happened. There's a lot of space accidents that happen you don't hear about. So the military will contact these corporations and say, hey, by the way, we had a little malfunction up there. Would you mind repairing the satellite or getting this if you can?

NOORY: Right.

SMITH: They have their own smaller space shuttles--they're smaller than our space shuttle--that maneuver around space and around our atmosphere, exoatmosphere. There is also very smaller versions of these type of like pods. So think of like a motorcycle pod that you can go around space just for one or two people. That is also in orbit all the time and are docked with these space shuttles and these space stations. And we do have a very special killer satellite up there that can project an EMF wave, electromagnetic field disruption wave.

NOORY: And knock out a satellite?

SMITH: And totally take a satellite out within a half a second and completely disable it. But I also can't understand is you know, we're going to put all these new weapons in space, but you know, someone with a high powered electromagnetic frequency pulse generator could actually take one out from here. They have special satellites and radars out there that pick up on these types of electromagnetic pulse bursts. So they can basically hone in and triangulate exactly where it came from.

NOORY: Where it came from, but who sent it up there?

SMITH: Everything that leaves the atmosphere on Earth is monitored. So if there is a corporation or a country launching anything into the atmosphere, that's going to be a

high threat satellite where they're going to monitor that very closely and see what type of frequencies it's delivering. Also shoot it with x-rays and you know, basically pick it apart from very, very far away.

NOORY: The Soviet Union set up a satellite around one of Mars' moons many years ago. And there was a picture of an object approaching that satellite. And all of a sudden that satellite went dead. I think it was an extraterrestrial craft. Possible?

SMITH: Very possible. Anything that leaves our exoatmosphere that goes beyond that is under strict surveillance. And they know what the--you know, they know the intention behind these satellites. They might be telling you, oh, we just want to look at the rocks on Mars. But really, maybe they just want to drop a bomb on Mars to see and measure the frequencies and you know, the atmosphere change and things like this. There's a lot of clandestine projects are launched into space and we're told it's just for space exploration or this, that, or the other. But actually, it's some other agenda that they're having that's usually negative.

NOORY: How do they retrieve once they're up?

SMITH: Yeah, they have smaller space shuttles which have like the boom arms that you see in the old space shuttle.

NOORY: Sure.

SMITH: Things are very industrial, very old fashioned. We're still using the whole gas, coal, and oil. And none of this is anti-gravitic, as far as the space salvaging. It's a very old school, archaic way of going up there still with rocket fuel, bringing supplies up there. That's why all these rockets keep going up there. These little space buggies that I was telling you about, the little motorcycle things that float around have these crab-arms to get very small objects that are located. And they bring that back to the shuttle and they go back to the space station. And that constantly is just this ongoing daily activity.

NOORY: When you talk about retrieving bodies, what bodies are we talking about?

SMITH: Well, there's been accidents in space. And every now and then a body is returned, a frozen body from space. Could be a human, a human extraterrestrial. They weren't born on planet Earth, I'll say.

NOORY: OK. They may have been a hybridization.

SMITH: Right, a hybridization. Many different species have been collected, by the way.

NOORY: With human DNA?

SMITH: With human DNA, correct. All extraterrestrials have human DNA. And they'll find these on the radar and they'll go out there and collect them, bring them back and send them back to Earth in these capsules. You're getting different parts of fibers, different types of metals and things like this that are reverse engineered. They do have full craft. They can't bring that back to the surface though.

NOORY: Too big?

SMITH: It's usually too big or they're worried about if they do send it down of course, it's just going to burn up, or could it actually hurt somebody.

NOORY: Or contamination?

SMITH: Or contamination.

NOORY: That's possible.

SMITH: So what they do is they send these salvagers out there to take apart the craft or to document it and video it and learn as much as they can, take pieces of it. Shoot it with very advanced radar technologies to see what's inside the walls, to see what the propulsion units are, these types of things.

NOORY: What have you specifically seen here, Emery?

SMITH: I have just seen pieces of metal, weapons, medical devices, bodies, parts of craft, propulsion units from craft that they have brought back to the compartmentalized programs in the underground facilities I was at that they had a big storage area for this stuff. And of course, the bodies go into a completely different area. So these are the things I've seen.

NOORY: What has been the most astounding thing you've seen?

SMITH: I think the material itself. When they do the all the testing on it and it comes back of these metals that we really kind of really don't have here on Earth or the mixture of certain metals together of how they bonded these atoms together to form super amazing pieces of material that we use today for protection and implants and all sorts of things.

NOORY: So you got more excited about retrieved metals than an ET body?

SMITH: Well, you have to understand too, I'm used to seeing bodies all the time.

NOORY: OK.

SMITH: So it wasn't like a big deal. But to know that our whole world can change just because of a material that can protect us, a clear piece of metal. They're using it in spacecraft, they're using it in weapons, they're using it in aircraft, they're using it in medical. They're using some of this stuff, of course, as far as the bodies, pharmaceutical stuff. So it is a reverse engineering or trying to duplicate that. We're trying to learn how they did it and how they made it. This program, you know, I call it like the secret NASA. Another one calls it the SSP and all these other pop culture terms. But it's been around for a while. They have very advanced space shuttles. They have very advanced suits. They're not the big, bulky suits you see on TV or you know stuff you see Neil Armstrong and Buzz Aldrin wearing.

NOORY: These are movable and stuff, right.

SMITH: These are very flexible, very movable, very strong materials that were reverse engineered. The helmets can go clear and dark electronically. They have their own atmosphere built into them. You can survive in these suits for many, many days. As far as breathing and urinating and defecating, all this is taken into account for these types of suits. It's kind of a cross between a space suit that you see back in the old days and--

NOORY: Something that a pilot would wear, that kind of tightness?

SMITH: No, not the pressurized suit. But do you ever see these triathletes when they swim through the ocean, they have these big skin suits on sometimes. Or you see the scuba divers going in Antarctica and they have the whole headdress and everything. So picture shrinking that big puffy suit down to a very skin tight level.

NOORY: Where you can move around.

SMITH: Where you can move around. It has articulated joints everywhere.

NOORY: Totally sealed in?

SMITH: It's very ambidextrous. It's all one piece. And it actually zip locks in the back of the person. And the helmet attaches to an aluminum frame that's on the collar. It's one giant piece of glass that has four segments with metal in between the glass to separate. But it's more like four or five sided. And inside there is a heads up display. And your com is in your collar. So all the computer stuff is in your collar that shoots up on your screen. And you can also see live video, which is transmitted from a hub. I could actually see what you're looking at if I wanted to. And it's all--

NOORY: Interesting.

SMITH: You know, it could be voice activated. There's usually a com that's connecting four or five astronauts at one time. Kind of like in "The Matrix" where you have that guy and he's on the computer.

NOORY: Right.

SMITH: And then the people are, you know, in the matrix. And he's like kind of communicating with them.

NOORY: Controlling them.

SMITH: And controlling everything. So it's kind of like that. There's always a big--it's a very team effort. It can go to hell in a hand bag real quick up there, so there's a lot of protocols.

NOORY: And the shoes must be self-contained too?

SMITH: No, the shoes are not.

NOORY: They're not.

SMITH: The gloves, shoes, and helmet are not self-contained. They all come on with this very light aluminum. They snap in and seal. And there's a button on there that actually pressurizes the suit once it's sealed. And there's sensors all over the suit that allow them to know if there's any type of pressure breaks or anything like that.

NOORY: Any leakage or anything.

SMITH: And the cool thing, the reason that the feet and the helmet and the hands are separated is because those are usually the areas that they have problems with lacerations and things like that. And they automatically have rubber seals on the inside that if there was like my hand, let's say I cut my glove. It immediately pressurizes that so I don't lose pressure in the whole suit.

NOORY: Oh, I get.

SMITH: It's kind of like a G suit, but smaller areas on the suit can do. Like a G suit, pressurized G suit for the F-16 pilots and things like this. A lot of these things were based off of the plants that have taken that were bullet proof, the leaves and things like that they reverse engineered from the portal journeys. And also reverse engineered suits that they had contracted from other extraterrestrials, things like that. So it's definitely not the same stuff that we're using. I think a lot of the things you see on the old school space shuttles and the old astronaut suits were actually--maybe they were saying it was, you know, this, that, or the other, polycarbonate carbon fiber, you

know. I really believe a lot of stuff was reverse engineered, but they're not going to tell the public that. So these things are definitely reverse engineered suits. I know for a fact, because when I was working with the super suits on the terrestrial basis, all that stuff was reverse engineered as well. And a lot of it was made of graphene mixed with titanium.

NOORY: Emery, what are the capabilities of our own equipment and satellites?

SMITH: We have satellites that can zoom in very, very high definition, unlike anything we have. See in so many different light spectrums as well. Now we can shoot into space and see what kind of craft is coming in and how many people are in there.

NOORY: Gees.

SMITH: And the same thing with satellites that are going up there. We can actually scan these satellite from very, very far away, see all the components that are in there, see if they're carrying plutonium or radioactive material, and have that information within seconds put right back down to terrestrial Earth so we know if it's a threat or not.

NOORY: Do other countries that have space debris up there go ballistic if they know that we're taking it?

SMITH: No. Because I want you guys to think more of corporations working together. There's many of these corporations are, of course, they're all over the world. But they're contracting. You know, SpaceX has no idea what they're putting into space. That's a contract job, it's classified. They don't know. It already comes packaged and contained. It's a very controlled environment. Just like we are controlled here about how much we can do, up there is the same thing. And these corporations have a really good strong hold on that. And no one's there to expose that, by the way.

NOORY: I mean, do they come back and say to the Chinese government, we just picked up one of your dead satellites. Would you like it back? Do they do that?

SMITH: Well, are you talking about the corporation?

NOORY: Yeah.

SMITH: The corporation would have no use for that anyway. But if they wanted to, they could take it if it was non-functioning. Whether they would like to inform the Space Science Administration in China, well, that would be, you know, up to them. And I don't think, you know, there's nothing like anything to promote a war or to take someone's property. Because property up there is property. Whether it's a damaged

piece of property or whether it's an active satellite or active station or a body, it is property of some origin in the world. And one of the most interesting things we retrieved was a reptilian-like arm on a 10 foot piece of metal. Which we later figured out this was a weapon of some sort.

NOORY: Gees. From?

SMITH: It was just floating with the space junk.

NOORY: But where did it come from?

SMITH: Well, we don't know. By the way, the arm was a reptilian frog-like arm with three fingers. So I want you to picture this long arm and this 10 foot spear. And the arm alone was probably four or five feet long. So this is was a very large being. And the hand and the fingers were molded into this giant spear.

NOORY: What happened to the rest of the body?

SMITH: We have no idea. We never found anything else.

NOORY: It was gone. All right.

SMITH: But we have found bodies similar to this arm before. And I've seen these in the projects. I don't know the specific race of that. All I know is the DNA, when they took it from the arm, matched the DNA of this metal. And the metal had DNA in it. So there was some sort of connection. And it really looked like it was molded. You know, we first thought maybe it was just melted from the craft exploding. And maybe the body somehow quickly was introduced into this giant spear. But it wasn't. We figured out later that somehow it can trans-dimensionally put its hand in the metal and operate this weapon. You have to understand that there's a lot of things going on up there that's very dangerous--that by getting this space junk back to the planet, reverse engineering it, enhancing our technology in space and our space suits and our craft and things like that allows us to step up that ladder to the next level. Whether that's going to become declassified soon, I do see that happening. Like they're already starting to change spacesuits now, I heard. I haven't looked at them, but I've heard this through the grapevine.

NOORY: Why don't the ETs come and retrieve their own stuff?

SMITH: I believe they do when they can. But there's also they want to like stay out of this area, this atmosphere, and let us thrive. And they're watching us and they're seeing what we're doing. A lot of times they put stuff in space for us to find on purpose to help us.

NOORY: They kind of plant it up there?

SMITH: Yes, they implant things up there. So they're doing that for us to motivate us to reverse engineer things and to help us with a lot of scientific breakthroughs that we have on the planet all the time.

NOORY: How unique is our planet, do you think, in the universe?

SMITH: Oh, it's definitely one of a kind of the universe with all the different types of species and the beautiful atmosphere. You know, this planet has been here for millions of years. And it's been visited millions of times. And it has had many, many different civilizations here throughout its life and within the Earth as well.

NOORY: Do you know of anybody that's been launched into space to retrieve any objects?

SMITH: Yes, absolutely.

NOORY: Friends?

SMITH: Colleagues.

NOORY: Have they come back with incredible stories?

SMITH: Always. It's always an adventure. It's just like going into a new civilization or discovering something in a pyramid. I look at it as a--I'm an amateur archaeologist and paleontologist. So when I find a new discovery, it's always like the most exciting thing, whether it's just a rock that's in the shape of something that someone carved a million years ago or a bone that we've never seen before. Another amazing find they had was it looked like a basketball, but it was a perfect sphere crystal. And it was very, very highly dense. And it was just sitting out there. And they thought this might have been an unconscious craft at one point.

NOORY: Whoa.

SMITH: Because they thought it was moving by itself. Don't forget, everything is mapped in the exoatmosphere as far as the space junk. And anything new, it would always be there. We would know, especially if it's in orbit. You know, they always know. They track all these things, even beyond 85,000 feet. So he grabbed this device and brought it back. And they were really cautious with it, because they'd never seen--because a piece of glass up there just doesn't survive like this.

NOORY: Right, right.

SMITH: It has obviously some sort of other material or something. Or maybe, you know, this could be a civilization. Maybe it is a craft, who knows. So they had to monitor this in space. And it was a big question about when we should bring this back to the Earth or should we. Because you can't do the right testing--

NOORY: What are we bringing back?

SMITH: --up there. We don't have the right equipment, the right laboratories.

NOORY: No, that's a salvaging operation.

SMITH: Right. But this was something different. This was not--you know, where did this come from? It doesn't look like a scrap piece of metal, that's for sure. So they did. They got it, you know, onto the shuttle. And they did put it into one of these capsules and they did bring it back to the planet.

NOORY: And what happened, anything after that?

SMITH: Well, they found out that this is some sort of energy device. And they still can't crack any type of code on it. And that was a long time ago. We're talking '94, '95 area. And I've heard that they have collected more of these since then. A couple of my colleagues has informed me. But this is definitely some sort of energetic device that pulls energy from wherever it's at. And it gives off a special healing frequency. And they have done tests with growing cells around it, plant cells. Growing human cells, animal cells, fungi, all sorts of amazing tests.

NOORY: And it functions?

SMITH: And it functions somehow.

NOORY: Emery, you talked about some craft that might have been up there. Have we been able to identify any of it? And if we have, where might they have originated from?

SMITH: Well, we have a huge database in the compartmentalized labs. If you're part of a project, like working on specific extraterrestrial body, and then the next thing you know, they want to pull me to take me to the craft of this extraterrestrial. Which I had no idea. I wasn't even debriefed there was a craft, you know, because I'm not allowed to ask those questions. You're not allowed to do anything unless asked upon.

NOORY: OK.

SMITH: And that's how I was able to up my security clearance every three months. So what happens is you go there. We'll take samples of the craft even. Bring it back,

we check it with the DNA of the extraterrestrial. And I've said this many times before, they make a match.

NOORY: Sure.

SMITH: So then this goes in a data base. And you have to understand, I'm not the only technician doing this. You understand, there's other scientists or technicians there.

NOORY: An army of people, right.

SMITH: On many different other craft and bodies. So there's a huge database of this. And that's what got me so intrigued and so addicted to this position, was because it's like looking at an encyclopedia of the species of the universe.

NOORY: It must have been exciting to look at that.

SMITH: It was like the most profound thing. Especially seeing the actual bodies and the pictures and the videos and the autopsies that they had already recorded before I was even there. To know this had been going on for so long, and now these are new species coming in that were not documented that I was working on, that are still probably, you know, to this day, like you said, they're cross matching species with ships and crafts and seeing where do they come from. So they're doing this huge Christmas tree database of DNA and extraterrestrials and the craft. And they're recording all this and they're putting it down into these compartmentalized computerized systems. Which I know one of the main databases is in an underground facility in New Mexico. And the other one is kept in space in a vault. There's a vault in space.

NOORY: That's our seed, that vault up there, almost.

SMITH: Right, right. And there's also an underground facility in the ocean. So there's like three or four vaults that are keeping the data of this that cannot be hacked. Once it's put in there, you can't send a signal in there. You can't upload it. It has to be manually put into these things. Which I found is very archaic, but at the same time, it's probably the smartest thing to do.

NOORY: And it works.

SMITH: And it works.

NOORY: Will salvaging continue?

SMITH: Yeah. I think it's going to be a big business. Because the civilian community,

I think, needs to start cleaning up just our space junk that's already up there.

NOORY: Sure.

SMITH: So I think they're going to make that public soon. So I wouldn't be surprised after this airs, maybe within six months they might come forward and say well, we know we need to start cleaning up this mess out there. And you know, later on down the road they'll say, well, by the way, we found this other piece of junk, we don't know what it is. And they've already been doing this for 20 years. So I think there's going to be a release of this information to the public very soon.

NOORY: Thanks for being on "Cosmic Disclosure," Emery.

SMITH: Thanks for having me, George.

NOORY: This is "Cosmic Disclosure" with our guest, Emery Smith. Thanks again for watching.

The Ultimate Battle Continues Season 12, Episode 13

Cosmic Disclosure; The Ultimate Battle Continues Season 12, Episode 13

JAY WEIDNER: Hi, everybody. Jay Weidner here. We are back today with Jason Rice. As I remember, you were involved in a military action on a planet, and you met these werewolf-type creatures. What were you doing on the planet?
JASON RICE: Our unit was there for the purpose of helping to train the planetary population because we didn't number enough to do all the fighting. And part of our mandate was that we weren't going to do all of the fighting. We were there to help get them ready to defend their own planet, help them prepare as far as supplies, help their defenses, organizing their people into fighting battalions or units so that they could put up a defense for the false flag invasions that they were under.
JAY: Who was behind the false flag invasion?
RICE: The Draco, the AI, the Archons. They ultimately were the ones calling the shots on these invasions, these false flags.
JAY: And the Dracos, the Archons, and AI, are they three separate groups or entities working together, or what?
RICE: It's my belief that the AI calls the shots for the Archons as well as the Draco.
JAY: Who made this AI, do you know?
RICE: I have no idea. It was probably something that was part of the balance, part of the balance on a universal scale. In order for light to prevail, it needs to have a challenge, the challenge being the AI.
JAY: I want to get back to this battle for a second, but first, I want to talk about this planet that you were on. Do you have a name for this planet?
RICE: I've been referring to it as Planet One, because I have not recalled the name of that planet yet. And most of the references that we used were numbers.
JAY: Typical military.
RICE: Typical military.
JAY: Don't want you to know until it's time for you to know.
RICE: That's right. And we didn't have a need to know the name.
JAY: Is there any significance to the military or anybody to naming the planet Planet One?
RICE: I refer to it as Planet One because of my own experiences on this planet being the first exoplanet that I had been deployed to, aside from the moon and Mars.
JAY: So you were on this planet. How did you get involved with this battle?
RICE: We were in particular city that was right on one of the larger lakes, the lake being about the size of the Gulf of Mexico. This particular planet was about 2% larger than Earth, however, the difference being in that it was that there were 60% of the planet constituted landmass. So the other 40% was water, and there was no salt water.

It was all fresh. And so they had two moons. One of them, we called The Potato, because of its shape and it was a pale yellow. The other one we called Nike because of how quickly it moved, and it was like a light red. We were stationed within a city, Area 26, to gather intelligence, to get information on the local population because what we had to do was we had to train them. And so the information we needed was, OK, well, how is their civilization set up? What kind of structures do they have for government? What kind of trading do they have? What kind of manufacturing do they have? What are the possibilities for city defense? What kind of resources do they have available? And that was when we had the kinetic energy weapon attack. We'd been told as part of our training that one of their typical MOs was to bombard the poles to raise the water levels throughout the planet and try and flood out the coastal areas.
JAY: Did they do that, flood the planet?
RICE: Of course they did. Yes, they did.
JAY: A lot of people died there.
RICE: A lot of people died.
JAY: Most people live on the coast.
RICE: My estimates are that about half the planetary population died from the war over a 40-year period.
JAY: Wow.
RICE: When we got there, it was started out at about 2 billion. And so about a billion lives lost during that war.
JAY: So then these werewolf creatures, when do they arrive? Were they, like, the leading army for this invasion?
RICE: They were the army for this invasion. The civilization on Planet One was about where we were during the Industrial Revolution. They didn't have widespread wars, and so they did not have a military, or a defense contracting, or defensive base. This was all pre-large industrialized society. And so part of our job was there to help them prepare, and adapting their existing technologies to creating weapons. There was one area on that particular planet that had weapons, although they weren't at active war. And so that one area was what we used for the manufacture of their local weapons because our policies were that we weren't going to introduce advanced technologies, and the reasons being, at least what they told us--and I have my own thoughts on why--but what they told us was that they didn't want to upset the existing civilization too much with too many advanced technologies. And so what we did was we helped them with their existing technologies, which also meant that it limited how much advanced technologies we were allowed to use. And I know now that part of that was the deliberate hand tying of those in control so that the planetary populations would be deliberately reduced and the leadership of the planet would be receptive to the control measures that were eventually put in place.
JAY: So you're saying that whoever sent you in knew deliberately, did not provide the necessary defense weapons for them to successfully defend themselves against these terrible creatures that were coming, and they did it on purpose to reduce the population, all the time making it out that you guys are the good guys?

RICE: That's correct. They knew the end game was going to be a large planetary reduction in population. Their plans were that they were going to reduce it enough until the leadership of the planet was open to the financial controls, the controlling governments, the controls that they wanted to instill in place so that they could eventually have control of the planet.
JAY: Power move.
RICE: Power move.
JAY: I think we can basically say that you were foot soldiers for the Cabal.
RICE: Yes.
JAY: And so the Cabal is doing something on this planet. What is the ultimate goal for the Cabal on this planet?
RICE: Well, if you'll recall, the agreement that the Cabal had with the Mars Germans was that they would provide 24,000 soldiers to the Mars Germans who had an agreement with the Draco to get out of their moon base lease that they would provide 12 of their carrier fleet units and tens of thousands of soldiers to be used on what they referred to as border control. For the Draco, this meant expanding their borders. And so using these foot soldiers on these planets to establish a much faster means for planetary control. They didn't want to have to wait 2,000 years. They didn't want to have to delay for the planetary populations to work through their technology, to work on their social structures, to come up with planetary governments, and the hundreds, if not thousands, of years in which a normal civilization progresses, they didn't want to wait. So this was a quick way of doing it. They introduce a false flag invasion. We show up. Hey, we're here to help. We'll help you defend your planet. The cost of doing that was they turn over control of their planet.
JAY: You mentioned that the enemy were the Dracos. And so who were these werewolves?
RICE: These werewolves were creations by the Draco as their proxy to do whatever they needed them to do. And so the Draco line of thinking is, why in the world would they put themselves at risk when they have their proxies that are more than willing to do it, which included us as well as their creations, these werewolves?
JAY: And we already have programs and DARPA. And the Russians are also working on creating artificial soldiers right now. So it's already--
RICE: --already occurring. Yep.
JAY: All right. So now you are, what, headed to your first battle? You must have heard reports of these creatures slaughtering people? I mean, why don't you describe them again?
RICE: The briefings that we received were incomplete, and they were deliberately incomplete because they wanted us to, again, lose people. Part of their tactics was to have a large percentage of the population lost. So the briefings that we received were filled with gaps, holes. It didn't have information on what or whom or the technology levels of what we would be facing other than that we were going to have an invasion force. So we were out doing a patrol, just like we had done any number of days

before, probing the area to see if we ended up having a reaction, and came in contact. Me and eight others from my unit were embedded in a native--we called them the Indigs is what we refer to them as--indigenous. We were embedded in a platoon-sized unit of about 40 people, and were doing a platoon movement. I was on the outskirts of a larger city. Now you have to understand these cities that we were operating in did not have any large skyscrapers. The way that this civilization operated was that, when they needed more space, they spread out. And the way that their civilization was based was it was--you know, initially was based on trade and did not have a financial system. They did not have any fiat currency. That was later introduced.
JAY: By you? By you guys, right?
RICE: By the commanding staff as part of one of the requirements for--
JAY: Wow.
RICE: Yes. That was part of the control. And so they had a really stable civilization before we showed up to help them with this invasion. First contact--we were out on a patrol. My unit was embedded in this platoon-sized element, and we were on the outskirts of a larger city. And the first indication something was going wrong was the enemy had opened, I believe, prematurely because we were crossing a large avenue of one of their roads. And about a third of the platoon was exposed on the road when they opened up. And if they'd waited until we were all in the open, they would have had much better results. But thankfully, they didn't. Next to the road was this 18-inch deep little ditch. It felt like a scratched out piece of the Earth. Didn't feel like it was 18 inches deep. So most of us were able to take cover there. Behind us was a building about 30 by 15 by three stories. It was a smaller commercial building, stone block. And so to our front were off in the distance more like huts, residential huts. And those were too far to make it too and not really providing much in the way of cover, even if we'd wanted to. So the SOP was to fall back to a structure that would have provided us with cover. And this being the first contact, we wanted to fall back into that commercial building. So we moved into it and returned fire, covering the bounding groups that worked their way back into the building.
JAY: Were they just firing from a ship?
RICE: They were firing from the other side of the road in a forested area. And so at first, we couldn't see them, and it was just mostly shadows. And we couldn't tell who and what.
JAY: But you must have had intel that--telling you what they looked like previously, right?
RICE: No. This is part of the gap.
JAY: This is the very first encounter then?
RICE: The very first encounter. And my suspicion is that they had very detailed information on what they looked like, but we didn't get it. They kept it from us, again, in order to keep the casualty numbers up.
JAY: So then they were firing from the woods? What kind of weapons were they firing?

RICE: Found out later that they were a cryogenic type weapon and--
JAY: Cryogenic.
RICE: Cryogenic.
JAY: So freezing cold, what?
RICE: It used in a cryogenic substance. And given the level of our current technology that we have here, I don't want to get into how they work because some of it could be duplicated, and that's not the purpose of what I'm coming forward. And the last thing I want to do is provide another weapon for people to hurt other people with.
JAY: Fair enough.
RICE: But they were cryogenically operated. They were a bladed, projectile type. So it had built into it a large blade. And aside from that, these beings had large claws on their feet as well as their hands. They were bipedal. They were about eight to nine feet tall. They were a cross between a machine and biological material. You could see tubes or hoses or mechanical type joints in between their armor. They had black skin. They had tufts of gray or dark gray or black fur. They had a shortened snout full of teeth that they used to great effect. But our first exposure to them was after we'd all made it into the building. Myself and the platoon leader went up to the roof, and we were returning fire across the road. And when I got to the roof, I started hearing people screaming, oh my god. What the heck is that? And of course, they were a lot more colorful about their descriptions because, you know, we'd never seen these things before. And they moved at a really--what would be for a human--a really fast walk. But that was the extent of their pace, and they always moved that fast. However, they were capable of jumping incredible distances, which we found out very shortly on that first day. When they reached the side of a building, they never tried getting into the first floor where we had people firing at them. They jumped from the ground up to the top of the third floor and attacked us up on the roof.
JAY: Wow. So they weren't real fast, but they could leap.
RICE: They could leap. And we found out also, once they got within melee range, they dropped their weapons because it was harnessed to them. And so then they would use their claws or teeth. And at first I thought, OK, gosh. These guys are really, really dumb. But then after thinking about it and realizing later that these were created beings--and as part of the AI's attempt to create as many trigger pullers as possible--they didn't have to program them with high intelligence because they didn't need it. They just needed beings that were going to be pulling triggers. And so part of the problem was that in order to have a high tactical ability, you have to determine what targets to shoot at when you're at close range, so you don't hit your own. They eliminated that aspect altogether. So they dropped their weapons and went to claws and teeth or blades. So they didn't have to worry about the tactics of, OK, if I shoot at this enemy and my person or my team is close by, I have to watch out. They didn't have to worry about those algorithms.
JAY: They just dropped their weapon and started ripping everything up. And then, of course, psychologically that has to be--
RICE: Terrible. Terribly scary. Because you've got this nine foot beast coming at you

trying to--what we thought at first--was eat you. And it wasn't until later we realized that, no, it wasn't to eat us. It was just to eliminate us.
JAY: They didn't take prisoners or anything?
RICE: No.
JAY: Did you take prisoners?
RICE: We tried. Another part of their programming was that they would fight to the very last, and it was just another proof of how alien they were. There was no surrender. We had no POWs. You know, part of the cleanup process at the end of the war generally would involve taking care of the POWs. And there weren't any because they would not surrender, and they would fight with every last bit of energy that they had. That was part of their programming. It was very scary--terrifying at first. You know, some of the exclamations when they--because I wasn't at the wall, the parapet wall on the roof when they first emerged from the treeline on the other side of the road. But I understood very quickly when I got there why there were so many people scared going, what in the world are we fighting?
JAY: How many of them were there?
RICE: In that first wave, there were about 50.
JAY: And how many of you? There weren't very many of you.
RICE: 40 of us. And we found out really quickly that the .38 sized automatic weapons that we were using were pretty ineffective in taking them down. The secondary weapons that we had were about a .50 caliber, except they were a single shot. It was a semiautomatic, but it wasn't fully automatic. The magazine carried about five rounds. Problem was that we only had about 15 rounds per person. And so the first wave of about 50 came through, and we defended our position after that first wave and quickly caught on that our standard weapons weren't effective. And people started using their secondaries. And after you start shooting at something and nothing's happening, you've got to go to plan B. And so the second wave was about the same size. We found out that there was one commander for about every 15 to 20 soldiers, foot soldiers. And they were the only ones that took their eyes off of us. The foot soldiers--the trigger pullers--never took their eyes off of us. They were there were like a fire-and-forget weapon, and that's exactly what they were. There was large numbers of them that would just come until they either wiped us out or were wiped out.
JAY: All right. So you're outgunned, you're outnumbered, and they're bigger and stronger than you. How did you win?
RICE: That's a great question, Jay. And we weren't necessarily outgunned because eventually we would have had to have used our advanced technology, or we would have lost. So at , first they wouldn't allow us to use the advanced technology. And when they did, it was very limited. Now how did we win? They were programmed from the beginning have deficiencies because they weren't intended to win. These false flag invaders were intended to lose. They'd planned on them losing. Because the Draco looked at planetary conquering as they had to have the populations there because they wanted somebody to control to begin with. And the planetary population

had to ask and invite them. And so they didn't want to wipe them out. Because what would be the purpose of wiping out somebody that you're wanting to conquer? And so sending in these false flag invaders--from the beginning, they planned on them losing. The process of going through planetary population reduction was what they'd intended on happening from the beginning.
JAY: So the Cabal and the Draco are actually working together.
RICE: Yes.
JAY: And creating a theatrical operation designed to advance the planet quickly into the realms that the Cabal wants.
RICE: Yes.
JAY: I guess you must have figured out how to take them out eventually.
RICE: Eventually. What we first were trained to do was center mass. Shoot the center mass. You know, you try and make a head shot. It's moving around too quickly. It's really, really hard to do. So you aim for center mass. And with what they called the charge stopper--because, again, it was a local weapon, and it was about the equivalent to a .50 cal and about the size of a sawed off shotgun. And they used them for to stop charges. And it worked.
JAY: Up close it would be very effective.
RICE: Yeah. Very effective up close. You couldn't get much of distance on it. But it meant that you got it within arm's reach of this nine foot werewolf that was using teeth, claws, and everything else at its disposal to try and kill you.
JAY: When it came down hand-to-hand combat, did they use tactics like animals here on Earth and that kind of thing?
RICE: Yes. Yes. They would try and grab your arms and jump up with their feet.
JAY: And use their weight?
RICE: Use their weight. Dig their claws in. Of course, we didn't know any of this at first. And as, you know, trial by fire, you learn the lessons the hard way. And eventually, we figured it out. There were a lot of things that we figured out the hard way that they could have told us about, but they didn't. Part of our camouflage and systems were ineffective above two or three people because the electronic signatures were picked up. We found that out the hard way. In fact, my unit went about setting up some tests where we had the holographic camouflage systems that we used--we kept wondering how in the world were they localizing us? You know, we're effectively camouflaged, supposedly, from infrared and signals as well as visual.
JAY: And we're going to get in a later episode.
RICE: Sure.
JAY: The whole camouflage suit and everything. Very interesting. So this battle is going, and you guys at first are losing because you're so surprised by the ferocity of your enemy. And then, what, you eventually figured out that using the .50 cal up close was your only hope.
RICE: Yep, which is basically a 12 gauge slug shot. And that was what was working. And so once we realized that, the word went out to the rest of the platoon. We'd

already lost about eight people at that point. And so with the second wave, we were able to take them down with those secondary weapons. The third wave was, I figured, about a hundred of them that came at one time. They didn't waste much time in between. And so that was the scariest part of it because most of us were out of weapons, out of ammo. I ran out of ammo and ended up going hand-to-hand. And I don't recall much of the latter part of the combat because it just happened so quickly. I remember seeing people fall down less than 10 feet away from me. I was injured. I had multiple injuries, and I can't tell you when or how it happened.
JAY: And did you have like other weapons around you to assist you with hand-to-hand?
RICE: We had our combat knives.
JAY: Yeah. That's all you had?
RICE: That was it. We had fixed bayonets, so we were able to use our rifles as a spear, if you will, to only so much effect. But working in teams was the best defenses that we could come up with because, you know, one-on-one we were no match.
JAY: I was going to say, just the reach alone--
RICE: The reach alone.
JAY: --would be--
RICE: The eight of us, nine of us, including myself, that were there that had the nanite enhancements stood a much better chance of defending ourselves alone than the other soldiers that didn't have those nanite enhancements.
JAY: So you eventually defeated them, and you had to kill them down to the last creature.
RICE: Down to the last creature. There were multiple times throughout that four years where clean up or follow on troops or reinforcements would show up, and everybody'd be gone. Everybody, down to the last man. And they were all out of ammunition. And once they got down to the last very few people, that was one of their tactics is that they would wear you down until you were out of ammunition, and then you were at hand-to-hand. And in a hand-to-hand, they had the advantage.
JAY: Did they later rectify the situation by allowing you to have more ammunition when you went on rounds?
RICE: They increased our standard load. They increased it from 15 to 30. But there are still limits on how much the soldiers could carry. Having the nanite enhancements allowed us to carry a lot more. If they'd allowed us to use our combat armor suits, things would have gone very different.
JAY: So when you guys got back to headquarters, were you all POed?
RICE: We were very upset because where's the intelligence? Where's the information on who we're facing and what we're facing? And we were told suck it up.
JAY: In a way, they were developing you, though, by forcing you into areas where you had to be super tough. And then they'd pick out the tough guys and the tougher guys, and then they could lead other platoons, right?
RICE: Combat Darwinism.

JAY: Combat Darwinism. That's pretty funny. Well, Jason, it's been really good having you on our show again. I really appreciate all the great information you're giving us. We're going to get back to your adventures on this planet and this war in our next episode. I just want to thank you for having the guts to come forward.
RICE: Well, thank you for having me. And you know, one of the things I wanted to close out with is it truly is a blessing to be able to help bring about, in whatever way, disclosure, which is what we're here for.

ET Guidance of Human Ascension Season 12, Episode 14

JAY WEIDNER: Hi, everybody. Jay Weidner here. We are talking to Jason Rice. Hey, Jason. Thanks for joining us.
JASON RICE: Thank you for having me, Jay.
JAY: Jason, you recently got regressed hypnotically by hypnotherapist Georgina Cannon. In that regression session, you remembered that you were on a ship called the Heflem, right?
RICE: That's correct.
JAY: This is really an important memory, then, because you're pulling it out of something that's a mystery to you.
RICE: That's correct. During the hypnosis process, I recalled there being a exposure to those memories. The segmentation in my recollections is closed off, and I remembered seeing what appeared to be a door that was open and then closed real quickly. And so being able to get the Heflem information, which I had not recalled until the hypnosis, was fantastic, because the majority of my memories have been from the second 20 and back. And so a lot of the memories that I've had return from my first 20 and back have to do with the training leading up to it.
JAY: So just briefly, because you don't have a lot of memories, but can you describe the inside of that ship? You said you never saw the outside, but can you give us some details about the inside that you remember?
RICE: It resembles the inside of a US Navy ship in that it's cramped. There's lots of pipes and utilities overhead, bulkheads that are painted, in this case, you know, lime green, or they're cream colored.
JAY: Do they have, like, the doors that have the wheel that turns and seals the door?
RICE: No, the doors were automatic.
JAY: They sealed automatically.
RICE: Sealed automatically.
JAY: So it was, like, an advanced ship.
RICE: Correct. And if you got closed off in the wrong place at the wrong time, and so be it.
JAY: It should be pointed out that William Tompkins, the insider who recently passed, he reminds us that they used a Naval technology in the initial Secret Space Program, including submarine technology, because subs were already sealed off. So they could be used in outer space quite quickly. So looks like you were just in an advanced version of ships that were out there.
RICE: That's correct. And this would have been around 1985, '86 timeframe.
JAY: Very beginning of Solar Warden.
RICE: Yes. And one of the first editions of the SSP ships that they would have launched.

JAY: That's right. You remember what the crew is like that you served with or what your missions were, anything?
RICE: I don't recall any of the missions at this time. And, again, I think it gets into some of that higher self, determining what and when it's appropriate. The memories that I have recalled from my training leading up to this 20 and back were based on a lot of trauma training, and so being put through every imaginable kind of death that somebody can go through is part of your training experience. I have a pretty strong indication that my higher self has said, OK, it's not time yet. The crew that I was working with were other humans. I don't recall there being--at this time, anyway--aliens or any other EBEs that I had interacted with. Doesn't mean I didn't. I just--I haven't recalled it yet.
JAY: OK. Fair enough. Let's get back to Planet One, where you were battling these werewolf creatures, and we've learned that you were involved in something you called Combat Darwinism, in which both sides were manipulating you and the enemy for reasons that were political, essentially.
RICE: Yes.
JAY: And changing the culture of the planet so it fit in to the way that the Cabal operates.
RICE: That's correct. The Draco were setting up their own version of this planetary Cabal for their purposes. The Earth's Cabal involvement on this and other planets was strictly from the standpoint of they provided soldiers, ground troops. The Mars Germans provided that the Naval ships, as well as the Naval officers and crew. So the Cabal that was established and set up on these local planets are what the Draco were using as their proxies, and I imagine that they were setting them up very similar to what they had done and have accomplished here as far as setting up the division and being able to create societies where they have a divided society of elites that think that they are better than the others and that they have these rights that exceed others and that they can take advantage of the others.
JAY: It's interesting. The elites still stay within the boundaries of contract and law, even though they're doing things that are despicable. They still have a law and order setup. They're criminals who are following a code of conduct.
RICE: Yes. Even among the thieves, they have their own code of conduct that they have to follow. And I suspect that a lot of that has to do with the guidelines that are set up for them based on the Dracos' end game and what they eventually want and how they want it done. In order for them to have their power and their illusion of control, they have to have certain guidelines followed, and so those guidelines require that their proxies, no matter how despicable it is and the truly evil things that they're doing, they have to follow those guidelines.
JAY: You've told us at the Draco are allied with the Mars Germans. Are the Draco also allied with the Cabal, and aren't the Mars Germans and the Cabal enemies?
RICE: Yes and no. Again, when it comes time to having a need for something--the Cabal needed a moon base. And in order to take over the Mars Germans' lease, they had to provide the two divisions of ground troops. And so that puts them in bed with

each other as allies to an extent, even though they'd been fighting mercilessly for the previous 50 to 60 years over, you know, Earth.
JAY: And so the Germans manipulated the Cabal, in a way.
RICE: Yes, they did.
JAY: Very cleverly.
RICE: Very cleverly, and that has been going on since the time that the Mars Germans established themselves in Antarctica and established themselves with greater technology and basically bent the Cabal over a barrel and told them the terms that they were going to accept.
JAY: The Germans are OK with the Cabal going and conquering these worlds and establishing their own culture?
RICE: They're OK with it, because the command structure is held entirely by Mars Germans.
JAY: Just what they did in the United States at the end of World War II.
RICE: As part of the requirement for those two divisions, the 24,000 troops, none of them are above the rank of major, which means that any battalion commander is going to be a Mars German. Any brigade commander, any of the generals, any full colonels, all of the command staff and structure in the Navy, they're all Mars Germans. They call all the shots. They make all the command decisions. The largest command that could be held by any of the Earth humans was that of a company commander.
JAY: Would it be fair to say, then, that the Germans are actually conquering all these planets?
RICE: It could be said that the Germans are conquering these planets for their bosses. They eventually have to pull out and leave those systems, and when they leave those systems, they have to leave them with a certain amount of self-control, if you will, in which they are still controlling those local Cabals. Essentially, this is what repeated in Vietnam, where they go and they take over, they conquer, and then they leave. And they leave it up to whoever is there and left in place as the new proxies of the Draco under the full command and control of their required contracts in order to meet the requirements for us to come in and help them.
JAY: So is the ultimate game plan conquering the universe by the Dracos or what?
RICE: I believe that that's what they would like nothing better than to do. They don't have the resources to do it all at once, and they have agreements and galactic treaties that they have to follow until such point that they have, in their minds, the strength in which they can get out of it.
JAY: All right. I'll get into an area that you may not know anything about. If you don't, just say that you don't, and go on.
RICE: Sure.
JAY: It is apparent to me that the Draco wants something from us, that we possess something that they want. And I was wondering if, in all of your adventures and all of this, did you ever come up against the reason why the Draco are so interested in

conquering planets with humanoids on them?
RICE: You know, to answer your question, you know, what is it that the Draco are looking to get out of the humans? We will revisit this on another episode, but the short answer is that there are certain spiritual aspects of humanity that the Draco covet. And we'll come back to that, I think, in another episode.
JAY: All right. Let's get back to Planet One. You've just finished this first battle. You now have intel beyond any shadow of a doubt that you're battling a creature that is ferocious, dangerous, and you're probably demanding more and higher weapons so that you can defeat them in this war. And, again, it's combat Darwinism, so you're not sure what you're going to actually get, what kind of help you're actually going to get, right?
RICE: Right. That's correct. You know, part of the Mars Germans' setup for the command structure and the training on these units was that they would not take any trainers that had not been deployed on planet or in combat zones. So if you were training, that meant that you had already survived one--at least one deployment. And so that was their requirement and that, if you survived it, then you were qualified to teach. And so, when we got back after that first contact, and we started asking questions, that came back very quickly that that was above our pay grade. Don't ask those questions. Deal with what you've got using what you have. Your mission here is to train these people to defend their planet. You're not going to get permission to use advanced technology. You're not going to get the tools that are sitting right over there on the other side of that fence that would make it easier and save more lives.
JAY: And this was done because you didn't want the locals to find out about your high weapons.
RICE: That's what they told us is that they didn't want to disturb or disrupt the normal progression any more than we already were by introducing advanced technologies.
JAY: In a way, that's actually a good idea.
RICE: It is.
JAY: You can really screw up a people by advancing them too quickly.
RICE: It wasn't the real reason.
JAY: Yeah. It's not the real reason, but it is a good reason.
RICE: Sure.
JAY: All right. So now you're back. Are you now going to become a teacher?
RICE: No, no, no. I stayed there for the duration of the four years in which we were fighting.
JAY: How many battles were you involved in on Planet One? Countless?
RICE: Countless. Countless. Over a period of--
JAY: Did you ever get hurt badly?
RICE: 47 months. Not during this deployment. I was injured regularly, be it cuts or scrapes or deep wounds. The nano-enhancement therapies that we were provided allow for quick regeneration, so the eight or nine inch gash that I'd received on my right arm for that first combat experience was already starting to heal up by the end of that day.

JAY: Did it scar?
RICE: No.
JAY: So when you came back from the 20 and back, you wouldn't have had any--
RICE: No. The nano-enhancement therapies made sure of that. I had scars at other times that have come back that are mysterious, and where'd they come from? Why are they there?
JAY: Really?
RICE: But some of them have to do with the amount of time in between when you're injured and when the healing starts.
JAY: Right. And this war you were involved in for 47 months?
RICE: That's correct.
JAY: Did the war end at the end of 47 months?
RICE: The end of the war--we defeated the last of the invading units. And just like the prior 47 months, we weren't sure if there were going to be any more that show up or any others that, you know, leaked through the Naval blockade. And so it was a wait to see if there is another one, a wait to see if we had any more. At the end of those 47 months, my unit was redeployed to Callidus 3. And so--
JAY: You never knew.
RICE: --I never knew. I don't know. I suspect that it was over, because they wouldn't have pulled out my unit at that time to redeploy us to another planet to start preparations for getting another planet ready for the invasion.
JAY: This planet, Planet Number One, when you arrived, it was a semi-rural--not a lot of big cities, and cities weren't really highly developed or anything. Probably kind of a nice place to be.
RICE: It was a beautiful place.
JAY: Yeah. And at the end, what was it like? Did it change? What happened to the people?
RICE: Sadly, it changed tremendously over those four years. When we first arrived, the indigs had a certain amount of technology. As I had mentioned before, they were able to tap into their planetary electric grid, if you will, and were able to use some of the electricity from the planet itself for their building generations. And so they also had batteries. They had a form of railroad that they used between cities. Most of their work was done by muscle. They didn't have much in the way of draft animals. They had lived a very simple, civilized, barter type lifestyle. When it was time for us to leave, there were such large areas that were just devastated. Totally devastated. I mean, from rubble. There wasn't a single continent on the entire planet that hadn't been ravaged by the four years of war. So when I left that planet, the people were very changed. Of course, they were never the same. They weren't going to ever be able to go back to a barter style of life, a civilization that had polytheistic beliefs. They were very simple. They had clan-type arrangements for most of their governments. It was very organized, and everybody seemed to get along. Like I said, it was just one place that actually still had weapons that were in production. And I suspect that that was done because there were plans for the eventual invasion. And so there was a reason

behind it that went back probably decades.
JAY: In the 1930s in Europe, Mussolini, the fascist dictator, decided that he wanted to change Italy from a semi-rural environment to a highly urban, high tech society, and he used extreme fascist powers to accomplish this and killed many, many, many people in the process, not to mention helping to start World War II. And, eventually, at the end of World War II, Italy was indeed a modern country. So Mussolini, in fact, accomplished what he set out to accomplish, which was to do this. And it sounds like the Cabal is using these same tactics.
RICE: Same ones were used, bringing people in from the agrarian, agricultural based civilization out in, you know, the non-developed parts of the planet. If they didn't die outright during the war, they were brought into a city, helped.
JAY: And the reason would be, in some ways, the semi-rural, agrarian culture can take care of itself. It doesn't need anybody. And so you'd want to cut that--if you wanted to control people, you'd want to cut that out. Isn't that true?
RICE: That's exactly right. Part of the process was bringing them into the fold out of the fields.
JAY: So it became more of an urban type of environment after you guys got done messing everything up.
RICE: Yes, it did. After we were finished messing everything up, it was more urbanized. Same thing happened on the Callidus 3, Planet Two, the starts of it on Planet Three.
JAY: In a lot of ways, you were being kept in the dark about what you were really doing. You figured out a lot of it later, talking to your buddies and stuff and comparing notes. But at this stage on Planet One, you were probably very confused about what you were doing, and they kept you in that confusion.
RICE: Very young, very idealistic. We were there to help save them. We were kept in the dark. If this information was widely known throughout the units, they would have had massive upheaval. They would have had revolts, mutinies, quite simply. So they kept us in the dark. And when we did ask questions, we were told it was above our pay grade.
JAY: Did anybody ever get out of line in your military units?
RICE: Sure.
JAY: What were the punishments? It would be the Germans, right, that would be--
RICE: Yes. It would be the Germans, the Mars Germans, meting out any of the punishments. They weren't allowed to kill us outright. We also had protocols that prevented them from mind wiping us, but that didn't mean that the Cabal didn't put in place certain protocols that allowed the Earth units to mind wipe certain things.
JAY: And so it would either fall into a category of, hey, were we mind wiped by our own units? Or we'd go through the normal Uniform Code of Military Justice for punishment, no confinement to quarters, or confinement to brig, or cut in pay or grade, any number of things that they would do, or extra duty, extra details.
RICE: As I mentioned earlier, one of the punishments that we received for helping the local civilians during the Area 2 6 KEW attack was that we were not allowed the

replacements during the time that we were having to help clean up the aftermath of that KEW attack. And so, you know, the other 60% of my platoon that was there, we all had to put forward extra effort and extra work, because we were missing the replacements of the people that had died or were never found. And that was a punishment. You're not getting new people until you redeploy to the next place, because you were so interested in helping those effing civilians.
JAY: KEW is a Kinetic Energy Weapon.
RICE: That's correct.
JAY: You're about to be deployed from this planet, going to Planet Number Two, where you're going to have some more incredible stories for us. But just to finish up with Planet One, it wasn't designated Planet One by anybody but you for the interest of us being able to understand where you were. Yeah. Keep track of the story. So on Planet One, were there anything--besides the battle and the people, the nice people, and the ferocious wolf creatures--were there any interesting flora and fauna that you saw on this planet, and can you describe some of it?
RICE: Certainly. One of the things that I realized quite quickly was that the diversity of life on that planet, as well as the next two, wasn't nearly like what you see here on Earth. I remember being really surprised at that. And I didn't give it much thought at the time, but looking back now, I remember seeing that there were near pines. There were trees that were like oak. There were trees that were evergreens, conifers. You had, you know, all the freshwater fish that we'd encountered. Everything--they have very similar analogs that I've seen here. I mean, there was a lot of life. Make no mistake. It wasn't a barren planet. There were no deserts. I do you remember that. There were large areas that were completely uninhabited. It had arctic regions. It didn't have much life above the 60 degree level or below the 60 degree level. But the rest of it was teeming with life. It just didn't have as much diversification as we're used to seeing here on Earth.
JAY: Were animals quadruped for the most part?
RICE: They had birds. They had quadrupedal animals. None of the animals that I recall were two legged, so bipedal.
JAY: Do you have a reason why the animal life wasn't as diverse as it is here?
RICE: My suspicion is that because Earth is a unique case, a unique Petri dish, in which you have a lot of competing elements that are trying to work towards a goal, and that goal being, which of their pet projects is going to generate life that has a better chance of ascension? The Earth is a place where there are a lot of competing interests in creating life or changing or modifying or altering life here through modification of DNA or bringing life in. I mean, you could look at any number of species that have no historical origins. Where'd they come from? There's nothing in the historical records on, you know, how did they proceed? How are they progressing? Where do they come from? It's like they just popped up. They just came out of nowhere. And so Earth being the special place that it is--it truly is--and that, you know, there were a number of tests and experiments here to see which of the

lifeforms, be it aquatic or land or, you know, you name it, it started a long time ago.
JAY: Do we know who the people or creatures that are doing this experiment on Earth, on the people of Earth?
RICE: We do. We have an idea on who the different races are, based, again, on some of the history that they did tell us and teach us in the training.
JAY: You said that the ultimate goal of the experiment here on Earth is to create a creature that can ascend?
RICE: That has higher chances of ascension.
JAY: And what do you mean by ascension?
RICE: A higher spiritual connection is the way that it was explained to us.
JAY: Do the Draco have a soul or spirit?
RICE: I believe that they once did. However, their involvement with the AI means that they are so heavily invested in machine or computer type technology that that's a good question, whether they still do. I mean, are they mostly machine now? Yes. Do they still have--do they have a soul? I don't know that answer.
JAY: So you think the Draco are mostly machine now.
RICE: I think that they're so infected and infested with AI and nanites that the question can be asked, are they really a biological being, or are they just that appearance, a shell?
JAY: Wow. You have the advantage of having the nanites in you, but the locals didn't have the nanites in them, I think. So weren't they at a distinct disadvantage, fighting alongside you?
RICE: A huge disadvantage. Yes. And that's why there are so many of them that were lost. They could not even come close to standing up, and they were smaller than us Earth humans. So, no, they didn't stand much of a chance at all in hand-to-hand combat with these werewolves.
JAY: Would it be fair to say that there is a number of experiments that are probably going on Earth?
RICE: Yes. Yes, it would be fair to say that there are a number of experiments occurring here on this planet.
JAY: And each experiment is trying to accomplish something different, wouldn't you say?
RICE: Yes. Each of the races that are doing their own experimentation, whether it's on a certain type of fungus or on a particular invertebrate species or whether it's with the humans, they each have their own agendas and their own goals for what they want and how they want to see their projects succeed.
JAY: And one of these outside ET groups that's experimenting on Earth is trying to develop a creature that you said would be able to ascend.
RICE: Yes. The way it was explained to us was that--and I happen to believe that this part was not a disinformation campaign--and that what they're wanting to do is to create a life form that has a stronger spiritual connection to the creator. And, in that, they want to be able to speed up the ascension process, because, you know, this life that we see here is really one of the lower ends of the life spectrum, if you will. And

so seeing a being progress through higher levels of existence, of consciousness, is what their goal is. They're wanting to be able to assist with that. Now, humans will look at that and say, gosh, they're tinkering. Well, yeah. They're definitely tinkering. Well, how much tinkering did they do? Well, how much tinkering does it take to move from a primate to modern man?

JAY: And so these ETs that are behind this particular experiment must be benevolent.

RICE: That is a great question, Jay. And define benevolent. You know, does our existing consciousness and understanding really understand what their goals are? What are their goals? We don't even know what their goals are. Are they looking to help with this spiritual progression because they want to co-opt? Do they want to do it out of just the goodness of their hearts? We don't really know that. And I suspect that we won't really find out those answers until humanity makes its own step to the next level. Are they benevolent or not? I believe that a number of them are. Absolutely. The definition of benevolence is what really comes into question, because, you know, you ask one person, and you'll get one definition. You ask another person, you get another definition. And so is making a person, you know, more resilient to cold weather, does that mean that they're benevolent? Does making a person more spiritually connected to the creator? In what way? And there are losses. There are tradeoffs. If you increase one thing, you have to give up something in another area.

Pathogens and Space Viruses Season 12, Episode 15

Cosmic Disclosure; Pathogens and Space Viruses Season 12, Episode 15

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith. Pathogens--they're not just restricted to Earth. They exist everywhere in space. Emery, welcome back.

EMERY SMITH: Thanks for having me, George.

NOORY: First of all, explain for us, what our pathogens?

SMITH: Well, with any type of biological entity, you have cellular material, such as a lot of the beings we work with have the same type of blood. Very similar. They have white blood cells, red blood cells, thrombocytes. Now with that, there's always other viruses and bacteria, which are pathogens that like to feed off of these other cells or mutate them in some fashion or another.

NOORY: What about the possibilities of bioterrorism being done out in space.

SMITH: Well, exactly. This is what's happening. When they acquire beings from outer space, let's say, that have maybe had a shipwreck and their craft exploded, they will take these bodies, and these bodies do come already with bacteria and viruses on them that are from un-Earth origin. So big pharma is really big on this. So they will get bodies, and they will test the proteins of the DNA, and they will try to find cures and things from otherworldly beings and their cellular matrix. Just like penicillin is made from mold, the antibiotics are coming from these negative type of pathogens, even when we make recombinant proteins, that actually comes from the E. coli virus. So good things can come out of these, but also, as you said--

NOORY: Bad things.

SMITH: Very bad things can come up. They can create new viruses and things that are resistant to the drugs that they make. So even though they're making a drug to cure you, they can also make a virus that's resistant to it. So they have to put money into making something else that you have to buy that's more expensive.

NOORY: Is it conceivable that a pathogen can come here on an asteroid or something like that?

SMITH: Well, exactly. We're all star dust and star seeds. And what that means is there's many types of bacteria that can actually live in space. So that being said, a lot

of these particulate matter do get caught in our atmosphere and eventually come down to the oceans and to the surface. So who's to say that a lot of these new things that are sprouting up, like these different viruses around the world, also could have just been naturally, organically implanted here and mixing with other viruses and other cellular material to make a super virus?

NOORY: I mean, if something like that did hit the planet, it could literally wipe out civilizations, couldn't it?

SMITH: Just as we have disembarked deep into the Amazon, and these aboriginal people and tribes out there have never been exposed to certain bacteria, simple things--

NOORY: They get wiped out.

SMITH: They get completely wiped out. With the advent of all the traveling and the millions of flights that are happening every day, it'd be easy just for one person to transmit one virus all the way around the world within 24 hours. And it just mutates so quickly. The virus will encapsulate so many people, especially the older population and the younger population and those with immune deficiencies.

NOORY: How long would it take science to say, this pathogen is not from this planet, and we don't know how to stop it?

SMITH: They do test the DNA on a lot of these different pathogens to find out where did they originate from, or where do they mutate from? So far, I'm not aware of anything that has been mutated from off planet, even though I'm aware of them keeping encapsulated in secret compartmentalized projects in underground facilities many different types of viruses and pathogens that they have collected from around space and around the planet that did not originate from here. But as far as the viruses that are out there right now the cold viruses and even this new bird virus 90 that's going around that there was a big scare three weeks ago in China, and this is what's happening--these viruses here are mutating, and they are also being man-made.

NOORY: What about extraterrestrial viruses created by extraterrestrial races to wipe out other civilizations?

SMITH: It's more of a synergistic thing. Just like we have very healthy bacteria in our gut to keep us alive and also on our skin that helps fight off negative viruses and bacteria, they have the same thing. So it's not an intentional thing, but it is something that they would see us as a foreign virus ourselves. So if their cells would happen to mix with us, yeah, it could definitely wipe out the entire planet. I think really hypothetically speaking, people are just out there getting programmed by pop culture. They don't need anything we have. They have already mastered interdimensional

travels. They have mastered traversing the universe, which means they're not using gas, coal, and oil. They're using some sort of energy. They're able to 3D print anything they want--their food, their minerals. They can grow a craft in space. So they don't really need anything that we have here on Earth, except probably for us to survive.

NOORY: So I want you to go out on a limb here, Emery. What you're saying is that you do not believe there are extraterrestrial races out there that would try to contaminate us or kill us with special pathogens or viruses?

SMITH: Alls I'm saying is, there are races out there that could possibly do that, but they're not allowed to.

NOORY: By?

SMITH: By, I think, some sort of galactic federation.

NOORY: Really? You don't think there's a rogue race out there that would do what they wanted to do?

SMITH: Well, I think there's a lot of rogue races out there. I also believe there's a lot more positivity in the universe with these beings that are trying to protect us. I mean, we're still here. I think even if there was a dangerous extraterrestrial civilization coming here, they still would probably just be monitoring things. I do believe of Inner-Earth extraterrestrials that have been here longer than us that may have another agenda. My own opinion--just because of being in the projects and hearing some of these people talk and picking up on cues about these Inner-Earth beings. And there's many different civilizations that live in Inner-Earth that have been here longer than we have that are doing monitoring and other things. So I think maybe they might have an expectation of, well, we were here first type of thing.

NOORY: Could that agenda be to change the human breed, basically create a different hybrid species?

SMITH: Well, I think that's just inevitable. We're going to be interbreeding in the future. The hybrids that they've already made are already part human and not--

NOORY: We could be hybrids already.

SMITH: And we are hybrids. We are definitely hybrids. We have genetic depositions from all the different types of star systems around this universe that you can see through your telescope. And the only way we can prove this to the public is to eventually--hopefully the compartmentalized projects and these corporations will release the DNA genetic database that they have, because just like with the Atacama

Being that we were taking the DNA on just recently, as I was published there at Stanford University with Dr. Garry Nolan. There's things going on that are going to come to the surface. But without having the proper genetic DNA library, and you come up short 8% on something and you can't figure it out, that would fill in the gap for many things. Even the gap of going from Cro-Magnon man to us, to say, hey, well, what happened here? And why do we have these extra gaps in our DNA? Where do they come from?

NOORY: The late Zecharia Sitchin contends that we were genetically altered, that the Anunnaki, a different race, different ET race, came from a planet called Nibiru, and came here to genetically modify us because they needed workers. Hence, here we are.

SMITH: I believe in the Anunnaki, and that they did come here. And we did have some help getting to who we are today for sure. I don't agree, or I'm not sure about them collecting gold or using us as slaves, but we definitely had help as far as evolving into human beings. It just didn't happen out of nowhere.

NOORY: Are they our gods?

SMITH: I wouldn't say they're our gods. I would say that they're more advanced than us, and more advanced than most civilizations. They have mastered interdimensional travels. But they can only come here at certain times of the Earth's life, which means that there's only certain times when the dimensions are right that they're allowed to come to Earth and travel back and forth for a very short period of time.

NOORY: So in many cases, you have been surrounded by things that I would call benevolent, positive. Right?

SMITH: Yes. The majority of everything I've been exposed to was very benevolent.

NOORY: I mean, because of everybody I've interviewed in my career, you are one of the least negative people I've ever talked to. I mean, most people will tell you, doom and gloom. It's over for us. They're coming to get us. You're just the opposite.

SMITH: They would have already came and got us. It's obvious that the way the Earth is going right now, they're here to support us. And because of what I've been involved with these compartmentalized projects, I've never seen any shenanigans going on where they were trying to blow up a base or take out the human race. A lot of these ETs, of course, their ancestry has created us. Like you said, the Anunnaki.

NOORY: Right.

SMITH: Why would you want to create something and destroy it? It doesn't make any sense. You would want it to evolve and study it and see what they're capable of doing.

Also, I really believe that we are at the bottom of the pyramid, as far as the evolution of extraterrestrials. I really believe we came from extraterrestrials, and most importantly, extraterrestrials came from us.

NOORY: Now back to the pathogens for a moment. How could we even create a cure for something that comes from outer space when we don't even know what it is?

SMITH: Well, if that virus or that bacteria or that pathogen falls into the three-dimensional space, there's always a solution. And don't forget, the human body is very resilient. We're not all exactly the same. So the body can mutate on its own to fight a certain pathogen, and that's how we have become such a successful species. Over hundreds and hundreds and hundreds of thousands of years, we get stronger. Our DNA changes. It learns how to make special macrophages and the white blood cells to combat these types of pathogens and survive. And that's what we are. We're one of the toughest races in the universe, being bombarded EMF and scalar inphotometry and viruses and all these negative things, but we still seem to keep going. We have a very short lifespan compared to the other extraterrestrials that are out there, but that's just because they're more advanced than we are. And we're going to be there someday too.

NOORY: Is there a special program by governments to try to avert these kinds of problems?

SMITH: It's an ongoing thing where viruses are released accidentally, contamination occurs, outbreaks happen. It's completely kept under the blanket. That means the media is not allowed to know about it, the CDC--

NOORY: Well, there'd be panic.

SMITH: It'd be super--chaos, panic, stock markets would crash--it would be a really horrific thing. But this happens on a daily basis. There are teams out there that will neutralize an entire base of scientists if an outbreak happens. And if it gets to the surface, they wouldn't mind taking out a small couple city blocks to do it and just blame it on a gas leak.

NOORY: Sure. How could they be so foolish to have those kinds of accidents occur?

SMITH: Well, humans have ego, and we're all in competition, and a lot of these things happen with internal espionage with agents. Most of the time, they're trying to figure out the biology of these pathogens and use it for the good and the bad. And it's very rare that they would make something bad first.

NOORY: I think if governments could create pathogens that could destroy, they would be making it like crazy. I think they already do.

SMITH: They do. And that being said, some of these pathogens actually can attack just certain genetic DNA--certain races.

NOORY: Give us an example of this genetic attack on specific races. And have you been part of that secret program?

SMITH: I wasn't part of the secret program, but I was debriefed on that program, because a lot of these pathogens had come from some of the bodies that I was taking samples from. When those samples go out, they do all sorts of things. And I was always curious. After a couple of years, I was able to be debriefed on them getting cellular material, like you said, making it into a virus or a bacteria that can eat with just that entity, that being. So that being said, they could do the same thing for us. If they just want to wipe out Caucasians, they could wipe out all the Caucasians.

NOORY: Have they tested that?

SMITH: Yes, they have.

NOORY: And has it been effective?

SMITH: Yes. They have huge underground facilities and mock cities set up larger than football fields, that they actually use real people and some clones, and they release these outbreaks.

NOORY: These poor people have no idea that this was going to happen, obviously.

SMITH: No. They'd have no idea they've been mind swiped, and they've been captured, and a lot of them have no clue whatsoever that they're even in a project, because these scenarios only last less than a day. And everyone at the end is completely gassed and taken out and disposed of.

NOORY: How many people have they killed?

SMITH: Hundreds of thousands.

NOORY: Hundreds of thousands?

SMITH: Hundreds of thousands, easy, per facility per year.

NOORY: So let's say that they are aiming at Caucasians or Asians or Africans, and they just want to eliminate certain races. They have experimented on them, and it's been successful, in your opinion?

SMITH: Very successful. Yes.

NOORY: How do we combat that?

SMITH: I think there's going to be a lot more of these insiders from these projects. They're just scared to come forward, but a lot of these people are on their deathbeds, and they want to come forward, give a statement, and let the public know about this so a proper investigation can follow this.

NOORY: So we need to be more concerned, it sounds like, people on this planet, then extraterrestrials trying to do something to us.

SMITH: Oh, 110%, George. We're more egoed and want the control and want to take over or depopulate the planet or whatever the agenda is, because by getting these contaminants and these pathogens and making these in the labs, like you said, this is a very bad biological agent that can be used in war. So of course, one corporation can sell this to multiple countries, and they wouldn't even know.

NOORY: Well we've seen cases where chemicals harmed or hurt or killed people. We saw the episode where the half brother of the North Korean leader Kim Jong Un was sprayed by a couple people at an airport and died. So you're right. I mean, these things exist. They're out there.

SMITH: Right. I mean, look what happened to Russia, if you read Tom Bearden's work. I mean, there's only a few scalar weapons on the planet, and there's only a few countries that own these things.

NOORY: Somebody watching "Cosmic Disclosure," this program, right now, what can they do when they hear these horrendous possibilities?

SMITH: I'll just say, there's a lot more good people on this planet and a lot more good corporations and a lot more white hats secretly in political areas then there are the negative people. And there are scientists that work on these projects that have developed these things forcefully or have been extorted to.

NOORY: And they didn't want to do it?

SMITH: They did not want to do it. But they also are a great facilitator of making sure these things don't get out.

NOORY: You think we can win this battle?

SMITH: I know we'll win it. It's just a matter of time. All truth always prevails. I don't want to instill fear into the public, because I know too many good things that are going on in the projects. A lot more good things are going on as far as protection for us and the elimination of these things, because it's too dangerous.

NOORY: By whom, though? Who's really out to protect us?

SMITH: Well the actual people that are working in these projects, number one. They have families too, and they're not very happy about the way they're being treated.

NOORY: Is there an internal fight here, Emery, between the good and the bad?

SMITH: It's not an internal fight. It's the unheard heroes that are in there being very patient, waiting for the right time, and self-sacrificing their lives, which has been done many times. Even in the Denver base, those explosions were from their own employees that were trying to take out some of the underground facilities there a few years back. So there are a lot of white hats, even in the political government, and even in big pharma. And these other major corporations that run the planet, that they're watching everything, and they're waiting for the right time that they can be defensive and be protective, because there's 7.5 billion people here that are at risk.

NOORY: You've been in laboratories. Have you ever been asked to do something that you didn't want to do?

SMITH: No. My last few months though, working in the compartmentalized labs, one of the reasons I left is because one of the bodies that came in seemed very warm, even through the suit.

NOORY: Human bodies?

SMITH: Well, human extraterrestrial bodies.

NOORY: OK.

SMITH: We have temperature gauges all over the bodies. We know what the warmth is. And it seemed to me and it felt in my heart that this ET died unnecessarily, somehow. And it was more of feeling like this is a real conscious being that has just passed within maybe a few hours.

NOORY: Or was killed.

SMITH: Well, that's what I'm saying.

NOORY: What did this human to ET look like?

SMITH: It was very tall, a little bit taller than me. I'm six foot four, so it was probably around seven feet. It had very pale skin, very large blue eyes.

NOORY: White hair?

SMITH: No hair.

NOORY: No hair at all.

SMITH: No hair, very small lips, and a very long nose. The eyes were offset, almond-shaped but more to the side, a little bit wider than our eye set. But for the most part, has everything that we have--the five star, two hands, two arms, just a very active ectomorphic type of body. An ectomorph means long, lean bone. There's three body human somatotypes that we call ectomorph, mesomorph, and endomorph. And this tells you how the body actually looks when we're describing things.

NOORY: How did this entity die, in your opinion?

SMITH: I think it died very unnatural. And it was after that time that I was becoming more conscious, and I knew it was either stay in the projects forever, or go ahead and it's time to resign.

NOORY: And you left?

SMITH: I left.

NOORY: You think that was the smart thing to do for you?

SMITH: Absolutely.

NOORY: You never looked back?

SMITH: No, never.

NOORY: Did you do anything with the government that you're not proud of?

SMITH: No. I'm very proud to have worked hand-in-hand with some of the most amazing surgeons and physicians and scientists from around the world and from around the universe. It was a great blessing in disguise, and I kind of miss it, in a way. Being responsible for multi-million dollar equipment and being a huge asset to the military and to these projects, not knowing that was worth that much. And then getting out, and then being able to produce patents and things to help society and help the world.

NOORY: Throughout the history, mankind, of course, has tried to take advantage of other human beings. They've done that all along. Can ETs do the same thing?

SMITH: Well, they were once us. But let's just say they've grown up a little bit since then. So their agenda is not about taking over and destroying. It's more about preservation and helping a society that needs help. I mean, we need help. I mean, look

at us. Look what we're doing today--destroying the Earth and destroying each other. What kind of successful society does that?

NOORY: All these viruses that are on the planet right now, might they have been dumped on us? Or do you think they're planetary bound?

SMITH: I think the planet evolves. We're discovering new species every day in the oceans, in the Amazon, I mean, every day. So what's not to say bacteria and viruses are species too? So these things are mutating, forming through all different types of reasons. Which I think it's synergistically working with the stars, the stardust. I think it is happening where maybe a lot of these hybridization programs, some things do leak out. Some of these bacteria, some of the beings escape now and then, and that will change the entire ecosystem of a planet.

NOORY: These ET races, Emery, that are out there, what is their mission and their goal? Are they trying to breed us and change us. Or blend their DNA with us?

SMITH: Well, I think a long time ago, that might have been the case. I do think they were breeding us. I think they were experimenting with us. I do think we were like an experiment that flourished, actually. Even though there's a lot of bad things going on, as a species, I mean, look at us. We are resilient. We're like a virus. We go everywhere, infect everything, and it's a great survival capability that we have. So I think they admire that, and I think that they know that we were the first seeds, even though they made us. I think that we become them, and I think they become us.

NOORY: Could they take the best of their DNA and the best of ours and combine it?

SMITH: Well, absolutely. That's what's going on. It's perfecting our DNA, number one. We're trying to perfect our DNA. We're trying to do DNA tests so we know what kind of cancers we might be predisposed to, things like that, which help us learn how to do gene therapy and help cure us. So these things are all back reverse engineered technologies and intelligence and ideas from extraterrestrials.

NOORY: So you're basically saying there's a cross-breeding program that's going on universally, aren't you? We came from the ETs, the ETs came from us? 558

SMITH: Yes.

NOORY: How so?

SMITH: Well, just like we're interbreeding with different countries and continents and races here on Earth, don't be fooled that we wouldn't do the same thing if we were in space. The gene manipulation is not happening on a mass production. They are doing these single tests on single humans and extraterrestrials on both sides of the story

here, to figure out how to improve life and how to--

NOORY: Governments and ETs?

SMITH: Yes.

NOORY: Together?

SMITH: Right. Government does not mean governments. It just means--because governments control the military, which protects the corporation's labs. Let's put it that way.

NOORY: Sure.

SMITH: Because when people think--

NOORY: Well, there's a different agenda what's with that side of it.

SMITH: Right.

NOORY: Isn't there?

SMITH: Yeah. And I think they're doing a lot of this testing, though, to more, like you said, make a super human. Make them improve so we have telepathic communication that's easier, and also to levitate and things like this. We're all capable of amazing things. It's just we're not really turned on yet on those DNA genetic codes yet, including activating different parts of the brain to do certain things.

NOORY: Maybe they're trying to build super soldiers.

SMITH: Correct. Yeah, they are doing things like that too--not only for soldiers, but also mixing DNA with animals and soldiers to make the ultimate combat weapon.

NOORY: Emery, you've been in a laboratory. You've touched viruses. You've been all over the place. Have you ever been exposed to anything from ETs or even human viruses?

SMITH: Only recombinant proteins and DNA. Nothing from an actual ET. We have these very amazing suits that we wear that are very protective. We're in vacuum negative pressure systems, so it's unlikely you'd get contaminated. It can happen. We have had incidents on the facilities where there has been a breach in the suits or in an operating room where they had to shut down that whole area.

NOORY: What's the worst thing you've ever seen to somebody who has contracted some of these viruses? What happens to them?

SMITH: Well, the only thing I've ever heard of--I've never seen it--that someone's suit somehow was compromised. The frequency of this virus or whatever it was so vibratory, the cells around your human body couldn't keep up with it. So it kind of disintegrated them from the inside out.

NOORY: I think the primordial soup is the same throughout the universe, so the complexity and the mixture of all of us--we're all related, I think, universally. Aren't we?

SMITH: Well that's the concept here, is trying to figure out how to raise our consciousness, number one, and number two, don't forget, we're all one. If you really think of it that way--and science says we are. We all have the same genetics, or part of each other, even extraterrestrials. So that has definitely led me to believe that we do have a oneness that's connected, a same vibration, a same frequency. If we just start learning to listen to each other and communicate correctly and not get this communication mixed up, I think we'd all get along a little bit better.

NOORY: Is there an ongoing ET genetic manipulation of our genes? Are they doing that now?

SMITH: I don't think they're trying to look at us and send down a type of special energy beam or infect us with anything. I think we're evolving this way because the universe is evolving. And I believe in this morphogenic field of energy that if there's a lot of good things going on, even getting evolved as a human being, that it's affecting us that way. Whether they have their little big meditation group going on the other side of the planet, that's a good way to look at it, because it's affecting the entire universe, including us becoming more conscious and more intelligent.

NOORY: Will we become super humans because of ET manipulation?

SMITH: I like to see it as this, because at one point, during a telepathic communication, they believe we are the super humans. They believe we're the superheroes of the universe, because we're so resilient, we've been through so much, and we're still here. And we're not going anywhere.

NOORY: Emery, thank you for being on "Cosmic Disclosure."

SMITH: Thank you, George, for having me.

NOORY: This is "Cosmic Disclosure" with Emery Smith. Thanks for watching.

Induction into the SSP Season 12, Episode 16

JAY WEIDNER: Jason, thanks for joining us.

JASON RICE: Oh, thank you for having me, Jay.

JAY: A lot of people are commenting on time, and going backwards, and new timelines, and they don't quite understand it. But I want you to reiterate how it works in detail.

RICE: Certainly. The 20 and Back Program is based on removing a person from their everyday, regular life and putting them into a space program, or a classified project, or something other than their normal life. They continue living their 20 years just like everybody else in their initial origin life. And at the end of that 20-year period, the bifurcation point, the separation from the original timeline, the person that is on their 20 and Back gets age regressed back to the age they were physically when they started with the Secret Space Program, for example. And they're age regressed and then sent back through time to the time period that they left their initial original timeline. For instance, you have a single line representing time even though time is not linear. The split comes when I am living on this initial timeline with the rest of my family. It splits, and my existence goes and does other things. The rest of my family and everybody else continues on with their original course, the original time. I am also living out 20 years parallel to everybody else.

JAY: Right.

RICE: At the end of that 20-year period, I circle back to the point I originally split from and get reinserted at that point. So the 20 years that I lived parallel are still valid, still there, but it ends and returns to the initial separation point.

JAY: So therefore, the 20 years that your family lived didn't exist.

RICE: Without me, yes. Or is it in a different plane and still there?

JAY: Probably that.

RICE: There's questions to that. And I think that our understanding of time, space, and space-time is one that's growing. And with full disclosure, and the technologies, and the science, and the math, and everything that comes with that, I think we'll have a better understanding of what space-time time space is.

JAY: Well, I hope that clears things up for people because it is a difficult subject to understand.

RICE: It is. It is a hard concept to grasp--and a paradox.

JAY: You talked about that in your hypnosis session. Let's see what you said.

RICE: He talked about the 20 and Back.

HYPNOTIST: About the--

RICE: He told us that we would all be able to go serve for 20 years.

HYPNOTIST: Mhm.

RICE: And then at the end of that service, we would be returned back to the original time and place that we got our orders. And they went through the numbers, showed us a chart and a graph. Here's how much you'll be making. Here's how much we'll be taking out for your care. And at the end of your 20-year period, you should have $465,000 that you'll be taking with you.

HYPNOTIST: Mmm.

RICE: [CHUCKLES] We were all fools. They told us that we would be age regressed. And after seeing the technology, and being injected with it, and being physically changed, I had no doubts that they'd be able to age regress me.

HYPNOTIST: Mmm.

RICE: They didn't tell you if you survived. A lot of them didn't.

JAY: All right, let's go back to our chronology.

RICE: OK.

JAY: The last time we visited, you were telling us about they had made you sign a whole lot of documents, and then you joined something called IDARF.

RICE: The Interplanetary Defense and Reaction Forces were a unit that was border patrol, used for assistance on other planets. However, there were a number of training exercises and training periods that we spent here on Earth. One of them was in Antarctica, another one is in the South Pacific. But those were some of the final exams, if you will.

JAY: So now let's go back to that day. You're now--you're done with your meeting

with the captain. What happens next?

RICE: What happens next is he shows me to my quarters, which turns out to be very similar to a hotel room, any hotel room across the world that you'd walk into. It has a bed, a closet, a small bathroom, a dresser, a bedside table, a lamp--just your basics, no windows, no TV, no radio.

JAY: No computer?

RICE: No computer.

JAY: Interesting.

RICE: So I'm shown to my room. And I walk in, and the captain says, see you later, and leaves me with my stack of manuals and new uniforms and new equipment.

JAY: Manuals? What are these manuals?

RICE: It's basically the instruction books.

JAY: For weapons.

RICE: For everything.

JAY: For everything.

RICE: Everything, be it land mines, or area denial field generators, or your plasma rifle, your pulse pistol, any number of things. Well, it was about 11 o'clock at night by the time I made it to my quarters. I was mentally just wiped out. And so I took a shower, and then came and pushed everything off the bed, and crawled in bed, and went to sleep. I woke up the next morning. I had a very fitful night's sleep. I think a lot of it had to do with the fact that it was not the Schumann resonance in the background, and my body physically wasn't used to that atmosphere or that environment. I got up early the next morning and went to look for, OK, how am I going to shave? And how am I going to brush my teeth? And I found something that was referred to as a nanite epilation equipment. And I knew what epilation was, but I had no idea at the time what nanites were. This is 1996, and so it was long before it became a common term.

JAY: Right.

RICE: So I found the manual. And after reading through it, it explained that it uses a binary compound that when combined activates nanites that when applied through this device dissolves the follicle of the hair without water. And so when you're

finished, you take a towel, and you wipe, and the remaining hair just wipes right off, smooth, lasts for about--they said it lasted for 45 days. Mine, because of my hair follicles and how thick they are, lasted about 30. But supposedly, it lasted--I was amazed. And unbelievable--where is this? Why didn't we ever see this before? Again, it was another product of the Secret Space Program. They specifically used it to save water. Shipboard, you don't have a lot of water to use. You don't need water to use it. Same thing applies to the next item on my list that I had to find, which was the toothbrush. It was just, again, a binary component cream that was in a tube similar to what we use. And it has a special fitting at the end of it that releases a very specific amount of each compound into a chamber where it mixes. And it tasted like chalk. It felt like there wasn't enough of it. But after 30 minutes or so, my teeth felt like they'd just been cleaned at the dentist. And again, don't need water, don't need to use water. You don't have to produce waste water because of a need for the hygiene--another shipboard convenience that they had to consider.

JAY: OK, so now you've got your--you're shaved, and you brushed your teeth. And it's your second day in the Secret Space Program, second time around.

RICE: Yep.

JAY: What happened next?

RICE: I went in search of my uniform because I wasn't about to put on my BDUs from the day before. And I found that the new uniform had a digicam pattern, and it had a V-shaped pattern for the name tag and the unit. Underneath the wrist area on each forearm was another pouch. It was part of the medical kits that we wore as part of the feedback system between our computer systems and the medical systems that we wore. The pants and the blouse both had a liner in it. And the liner, it was a holographic material. And it's got a hologram in it. Well, except this was a material. And it was also the thinnest material that I'd ever held. It was tough. It was rugged.

JAY: Well, now you got your nice new uniform.

RICE: Yep.

JAY: Were you hungry?

RICE: It was about that time. So I did my morning exercises, and stretched, and made my way to the cafeteria.

JAY: What did you find in the cafeteria?

RICE: I walked in, and, well, there were these what looked like stainless steel shelves. It had an overhang above it, and it had borders about 3-inches wide on the side, and

the top also had about a 3-inch-deep border. And there was a single--looked like a black, painted, square button, three of them. So I walked over to the closest one and put my finger on it. And humming started, and then a faint, misty light appeared right below it. And then in front of my eyes, I saw a bowl with butter appear. So I knew what I'd just done. I'd just used my first replicator. And so that's what all these other bays were. And so, of course, I'm excited at this point. I'm like, wow, excellent. What do I get to use? This is Wonderland. So I go to the other end and grab my tray, and I start going down the line. And I push each button. You know, I'm going to push them all because I want to see what happens. And the first one had had eggs, and second one had a bowl of grits. I end up with bacon and toast. And then I picked up my butter, and the last one had a glass of water. So that was probably the happiest plate of plain scrambled eggs I ever had in my life.

JAY: So these replicators, they can make any food you want?

RICE: Well, they're pre-programmed for what the meal is that day, but you just get to select, and whether you want it or not.

JAY: Right. That day was a very, very busy day for you--

RICE: It was.

JAY: --your second day in the Secret Space Program, second time around. So let's talk about your daily life during this training, what you were doing, what you were learning, all the things that were going on.

RICE: Sure. So that day was spent walking from one side to the other, getting to know people, signing up for--[SCOFFS] signing up for pay, which never ended up coming through after 20 years. But that was, again, part of the disinformation, keep people's morale up and thinking that they're going to get paid. Then another thing that day that we did was to go ahead and pick up the number of postcards that we're going to be sending to our family. Again, that was part of their process of making sure that questions weren't asked back home about people that were missing.

JAY: And what would they do? Like, all these postcards, you fill out a whole bunch of them, and then they would just slowly send them like every few months?

RICE: Yeah. I found it very peculiar writing a happy birthday for somebody that--writing a happy belated birthday as in I was writing it late for somebody that was having a birthday in a year. So yeah, that was one of the things. They had an exact number of cards they wanted us to fill out. And they told us what to put on there in our own writing. But they told us what it was. And I get the feeling that it was AI-generated dialogue that they had us put on there.

JAY: So you think some computer was kicking all this out.

RICE: Yeah, I think it was a computer kicking it out based on our psych profile. And each one was customized. So if you never ever sent a card late, you wouldn't--like me--you wouldn't have to write a belated early happy late birthday.

JAY: Yeah.

RICE: Another one of the stops that day was in the psychiatrist's office. And part of the process for sending you back is having a very specific baseline on when you came in. I didn't realize it at the time, but it was also for the purposes of the mind wipe so that they know how things happened, what happened, exactly what color things were. Where was this? And where was that? Where were you? And they ask you 12 ways from Sunday the same question. And you're sitting in a chair. They've got sensors on the walls and in the ceiling that can monitor your biorhythms to see if you're lying or not, similar to a polygraph except 10 or 15 times more advanced. And that happened every week, one day a week.

JAY: And this was done because they knew they were going to wipe your mind, and so all the memories would be gone, so they had to make sure that they got it all down.

RICE: That they got it all down.

JAY: Interesting. OK, so now that you've gotten that, what did you do next on this day?

RICE: The large part of that morning was spent in the medical lab section and had to do with some of the enhancements that the--

JAY: What enhancements?

RICE: The enhancements that we were being given were the nanite enhancement therapy.

JAY: Why would they do this?

RICE: What they told us, the reason for the NET, the Nanite Enhancement Therapies, was to give us the best chances of survival. Because--

JAY: Well, how would they help? How would it help you survive?

RICE: Well, every single bone, lymphatic, glandular, organ, tissue, there wasn't a single system in the body that wasn't enhanced, that didn't have a nanite enhancement put on it. It would add to your abilities for your vision, for your hearing, for

controlling your adrenal glands. Say, for instance, if you were in a situation where you didn't have food and you needed to control your hunger, you could do that. And you could adjust how your body is distributing nutrients. You could adjust your eyesight. You could zoom on your eyesight. You could see in the dark.

JAY: Wow.

RICE: You could hear things at different frequencies that humans aren't normally able to hear. The standard protocols for every cell, every system in your body, are radiation protocols, which are for repairing damage from radiation because of being in space.

JAY: Right.

RICE: And so you may get a certain type of NET for, say, your organs, and a different type for your auditory, and yet a different type for your joints. But all of them get the anti-radiation protocols.

JAY: And it sounds a little bit like they're trying to create a super soldier.

RICE: It does. It does, but we didn't look at it that way. We looked at it like putting on a suit of armor, protection, like something that was--because it didn't change our natural strengths and weaknesses. It helped to augment them. And the training that we went through wasn't geared towards, hey, you're a better person, and you're a premium, optimal example of a human. No, these are tools that you have to use. And it took all of the 18 months of learning from the training to learn how to use the different nanite enhancements.

JAY: Are these nanites still in you?

RICE: No.

JAY: Are they flushed out of the body or what?

RICE: They are flushed out at the end of the 20 and Back. And as part of the out-processing that you go through for the age regression, you also get cleansed of all the nanites.

JAY: These nanites also control your health?

RICE: They control your health. They control your blood sugar level. They control the healing response that your body has. It doesn't take over. It just augments. So if it would take two weeks to heal a cut on your arm, it would speed up the process so that it would take only hours.

JAY: Can these nanites be hacked?

RICE: Yes.

JAY: They can.

RICE: They can.

JAY: Wow.

RICE: And we were scanned regularly, and I didn't realize it at the time what for. But knowing what I know now, we were scanned regularly for the AI threat.

JAY: Could you run faster too?

RICE: Not necessarily faster, but if you could maintain your top speed unenhanced, say, for a mile and a half, you could do it for five.

JAY: Wow.

RICE: So it's not that you went faster, but your abilities to sustain yourself at a high-performance level were enhanced.

JAY: What about reaction times? Did they increase?

RICE: The reaction times for us were driven mostly by the intuitive empath abilities.

JAY: Ah, right.

RICE: So not necessarily were they sped up.

JAY: Because you already have the equipment with the intuitive empathic ability, so you don't really need that.

RICE: Yes, yep.

JAY: That's interesting how this is all kind of coming together. Very well thought out how they did this.

RICE: Yeah. It was not anything new. We weren't Guinea pigs. That was a well-developed, very mature program.

JAY: Again, we'll take a look at your hypnosis session.

HYPNOTIST: When he talked about changes, what sort of changes was he talking

about? To the physical body?

RICE: The changes that I'd seen in the last day, the medical in-processing involved enhancements, nanite enhancements.

HYPNOTIST: What does that mean?

RICE: Microscopic machines.

HYPNOTIST: Oh, OK.

RICE: --injected into our bodies so that we would have enhanced systems. Everything in the body was affected.

HYPNOTIST: Everything is affected?

RICE: Everything was affected.

HYPNOTIST: Yeah, in what way?

RICE: If nothing else, it was for anti-radiation protocols.

HYPNOTIST: Oh, OK.

RICE: Some of it was for different poison protocols, enhanced vision, enhanced hearing, healing abilities, enhancements to our pituitary glands, to our pineal glands.

HYPNOTIST: The glandular system as well?

RICE: All of them.

HYPNOTIST: Mhm, make you efficient machines.

RICE: Yes, the better to use.

HYPNOTIST: Better use, oh. Did they tell you how they were going to use you--

RICE: No.

HYPNOTIST: --this efficient machine?

RICE: No.

HYPNOTIST: No?

RICE: No, they didn't, except that we were going to be used off planet--

HYPNOTIST: Off planet, oh, OK.

RICE: --out of our solar system.

JAY: How many soldiers were in with you in this training?

RICE: The total number of Earth-provided soldiers amounts to about 24,000.

JAY: And were they all different races?

RICE: Different races.

JAY: And sexes?

RICE: Male, female, different countries.

JAY: Sizes? Tall, short?

RICE: Full range.

JAY: Any majority race, Chinese or--no?

RICE: No.

JAY: Nothing like that.

RICE: Only program that I'm aware of is the MILAB. However, other countries have to have their own means of recruiting, training, selecting. So I imagine that other countries are probably either modeled after, or are copies of, or are very similar to the MILAB program. But they do exist.

JAY: So how many people were in your unit?

RICE: The smallest unit size was a squad.

JAY: A squad.

RICE: And they consisted of eight to nine individuals. And then going out from there was a platoon. And then there were four platoons per company and two to three companies per battalion. It's arranged very similar to Western military order of battle.

JAY: Right. So you're at this training facility. You've now used the food replicator. You've brush your teeth with this odd nano-thing. And now it's the day of the briefing. It's a day and a half later. They've told you they're going to brief you.

RICE: Finally, some answers.

JAY: Right. So what happened at the briefing?

RICE: Well, we walked in and go into the auditorium. And all of the other trainees from my class were in there at the same time. And they have a packet waiting for you because the auditorium is set up like a college classroom that has one of the foldable desks alongside of the chair--no frills, very basic. But on each of the desks where we were to sit was a package waiting for us that included paperwork for signing, more information on what we were doing. They started the briefing. The colonel that was in charge of the training regiment came up, and he was German, and started the briefing by telling us that we were asked here because we have special talents and abilities that they need. And what we were going to be used for was the tip of the spear, patriotism, stars, stripes, all the things that appeal to a young officer that's looking to help out his country. We were going to be helping planets defend their planets from alien invasion.

JAY: Really? And he was German?

RICE: He was German.

JAY: A thick German accent?

RICE: A thick German accent.

JAY: Really? And he wasn't US military because this isn't the US military.

RICE: No, he was not. And another thing I noticed at the briefing that a lot of the senior brass up on stage were also German and that there was no--and they all had thick accents. And there were no Western or European senior officers present on the stage.

JAY: Wow. That probably alerted you right away there's something--

RICE: That was a big sign at first.

JAY: Yeah, that's very interesting. So then what happened?

RICE: Well, they talked about the origins of their program in which there was no mention of alien ETs or assistance from aliens.

JAY: They took all the credit for the themselves.

RICE: Took all the credit for it.

JAY: I knew you were going to say that.

RICE: Did not say anything at all about a breakaway civilizations, didn't say anything at all about the Earth's cabal, no mention of that at all. They talked about how much money we'd end up with at the end of our 20 and Back, we would get credited with on our return. Of course, they were going to charge us for room and board and some of the equipment that we'd be using and going through. But it was just minor charges.

JAY: Really? They were charging you?

RICE: By taking it back out.

JAY: Oh, my god.

RICE: And so at the end of the day, we were supposed to have this nice, fat, shiny check waiting for us. There was no mention of mind wipe. There was discussion about the 20 and Back and that when we're finished with our term of service that they had the technological ability to regress our age and then send us back in time to the point in which we left.

JAY: So you're going to be 24. And you're going back with a--

RICE: A nice retirement nest egg.

JAY: What a great life.

RICE: They made it sound that way.

JAY: Yeah.

RICE: Yeah, they didn't mention anything about the mind wipes or--

JAY: What did you do with your money when you got back?

RICE: [LAUGHS] What money?

JAY: You mean the Germans weren't telling you the truth?

RICE: They weren't telling us the truth. Imagine that.

JAY: I can't even believe that.

RICE: The history that they presented in that briefing was very spotty. It did not have much in the way of information. The information that they put forth was more of the propaganda side of it, of how great it was that we were going to be helping out, and

how much benefit we'd be providing to not only our own families and country but to the human race. It was a load of BS. It was the propaganda lies that they use to try and get people on board.

JAY: Right. And it worked.

RICE: And it worked. Of course, it did. There was no mention of what they were going to do later at the end of our training. Similar to Cortes burning his ships, they notified our families that we had died in action. So if we wanted to, we couldn't go back because all our families thought we were dead. They either provided no body, in which it was just an empty casket, or they provided a clone in the cases. And they provided some clones so that people would have a body that looked just like their loved one to bury.

JAY: Wow.

RICE: And so there was no turning back. They didn't tell us that. They didn't say anything about that. [THEME MUSIC]

Recovering Crashed Alien Crafts Season 12, Episode 17

Cosmic Disclosure; Recovering Crashed Alien Crafts Season 12, Episode 17

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith, ET Crash retrievals. Now, we've all heard about Roswell and many other UFO crashes. Emery, welcome back to the program.

EMERY SMITH: Thanks for having me, George.

NOORY: Have you been on crash retrieval programs?

SMITH: Yes.

NOORY: Where?

SMITH: Well, I was stationed in New Mexico at Kirtland Air Force Base. And that's where one of their main facilities are, that they have these groups of individuals, from all around the US, that'll fly in, depending on their specialty. I was part of a three-man team that would be going there to evaluate the site, kind of like forensics, like when there's a death, and they wall it all off. So the military gets there first. They wall off everything, secure the area, and then we get sent in before anyone else goes there to basically look at all that material and the craft. If there's any bodies, what's safe to touch, what's not. There's many different devices that are put in place. We're many hundreds of yards behind, setting up base camps to analyze the crash site, make sure it's even safe to approach first. Using all sorts of different special cameras and whatnot to scan the areas with satellites, to make sure there's no extraterrestrial biological entity still alive, and if they are still alive, to go in there and treat them first. And since we were already examining many, many bodies, I was part of that project to distinguish what type of ET this was, and was it safe to approach. And also along with the craft and the material that were around there, such as the devices, since a lot of them are consciousness-assisted technologies that are linked biologically to the extraterrestrials. You don't want to shut a craft off that might be keeping the body alive of the extraterrestrial. So there's a lot of these. It's basically a triage of the area. Is it a safe to go? If it is, then other teams come in. We're collecting debris. We're collecting devices. We're collecting bodies and so forth.

NOORY: Why do they crash so often?

SMITH: Well, once any extraterrestrial manifests itself in 3D, even if they're interdimensional, they still fall under the laws of our three-dimensional space. So

they're not bulletproof. OK? They might be able to outrun us, form a gravity flux field around their craft, and things happen. They're not perfect either, and things can happen with their craft malfunctioning. Most likely, we shot them down, to be honest.

NOORY: Oh, really?

SMITH: Yeah, using scalar infratometry and energetic beam weapons. So there's a lot of this going on, because the governments and corporations don't want anyone to know that these things exist. Because if you do prove they exist, then you prove that they didn't get here by gas, coal, and oil. They got here by zero-point energy, free energy.

NOORY: And we want that energy.

SMITH: They're going to lose all their money, because we won't have to pay our electric bills.

NOORY: What is scalar energy?

SMITH: Well, scalar infratometry has been used for a very long time. I usually don't tell people to read books or promote anyone, but Tom Bearden has a really good book on scalar and photometry, if you guys could look that up and get educated on it. But it's a special type of frequency that travels within time and space. So if there's a device, let's say, in China, they could easily shoot it through the earth and vaporize just you. They can make a huge earthquake off the coast there in Asia and create a tsunami, or they could make a hurricane and have it take out Biloxi. So these weapons are very dangerous. There's only six of them that I'm aware of, that's documented, and they have been used all the time. Anytime you see a really cataclysmic event, it's usually done by someone intentionally to demonstrate to another country, Hey, if you don't give us what we want, we'll wipe you out, like we did Sumatra. This was just a test to show you what we're capable of. So the Japanese Yakuza has one. Of course the United States has one. I do believe Brazil.

NOORY: Where did we get this technology?

SMITH: We developed it, and it's also other reverse engineered stuff that we found. So that's the downside of any type of extraterrestrial technology falling the wrong hands, but don't forget, it also can be used to heal. It also can be used to clean up Fukushima in 20 seconds. So why are we not using this for the betterment of the planet is the question.

NOORY: When you're on a crash retrieval, what do you see?

SMITH: Well, I'll give you one example. I came across a craft that look like giant

LEGOs. It was probably about 50 feet by about maybe 30, 40 feet width, and it was crumbling, and it looked like it was made out of a meteorite, but very metallic metal-like. It was actually in the ground a little bit. It dug up some soil. And we had approached this craft, and it's already been scanned by the satellites for radiation and other things. We were the first individuals to walk up on it. I've never seen a craft like this in the projects, so it was kind of new for me. And it had broken qubits of it all over the place that were glowing an orange glow, but was not emitting heat or anything.

NOORY: No smoke, nothing like that?

SMITH: No, there was no smoke, no dust. There was a lot of debris behind it a few hundred yards that was made up of all sorts of extraterrestrial devices and things like that that must have fallen out. There were three extraterrestrial beings that were there, two were dead and one was on its way out. And they were a type of human, more bluish in color and very tall, about six or seven feet. And we have to be very careful, because the craft, you could still feel like a hum from the craft, and it's like the craft is still--

NOORY: Active.

SMITH: Active, operational. We have to be careful that we don't touch something, and it explode at the same time. A lot of these times that we walk up on these situations, the craft is actually trying to keep the body alive. We have experts there also that, if we don't know what type of ET it is, they try to do some things with it. One time, they brought an extraterrestrial with us that did know the race, and they were trying to resuscitate this extraterrestrial. And they were doing it through the wrong orifice, and there was another orifice around the sternal notch it had actually breathed through, and they were able to resuscitate him. Of course, we're called there because we know the best anatomy of these beings. We understand how everything works. We're familiar also with a lot of the equipment that comes with the beings and, of course, their craft. So it's a big laying out and triaging everything and making sure that this is safe to touch this isn't. Let's air-evac this being out immediately. Let's tried to save this being. At the same time, we have special devices, and we can tell if moving the being away from the craft could be deadly for that being.

NOORY: Do you have an ambulance nearby and stuff like that?

SMITH: Well, it depends where it's at. If it's near highways or if it's out in the middle of nowhere, they use giant VTOLs and helicopters and a lot of these other things, but there's always some sort of ground team. The state fire department, forestry division, and police departments all have their own protocol for downed aerial UFO craft, of course, to secure the area. No one can know anything. Don't let any media in until the

military gets there, and the military's pretty quick, within 30 minutes of a downed craft pretty much anywhere in the planet, it's going to be secured that quickly with a group of very specially-trained special forces guys that don't have anything to do with the craft, but they know that's the area they have to protect before more backup comes, and they get deployed very quickly.

NOORY: In your circles, have they talked about the Roswell case?

SMITH: Never. It's kind of like--it's just everyone knows it happened, and it's just sad. They don't know about the other one that crashed in Socorro at the same time.

NOORY: And Cape Girardeau.

SMITH: Cape Girardeau, right. Yeah. So there's a lot of these happening, and it's just sad. It's kind of like, it's been beaten up so much that it's hard for some people to believe, some people not to believe because all this disinformation. And so it's not really talked about in the projects compared to the new stuff that happens everyday that's 10 times more exciting. Even though it is covered up, it is being recorded somewhere. It is going on a database. I do believe one of our G8 countries that's really good at hacking things will soon hack into these things and expose these events.

NOORY: What about each ancient retrievals that go way back even to the biblical times of antiquity. Anything there?

SMITH: Sure. There's craft being found with ground penetrating radar all the time, deep within the Earth's crust, and basically, what they do for these types of situations is they'll scan it with some special technology.

NOORY: OK.

SMITH: And they'll take it back to the surface, this information, and they'll 3D print the entire ship, even if it's hundreds of feet or large as the Titanic, sometimes. And they'll recreate in 3D print, this whole thing, and set it up. And use that for a couple of years, practicing when we breach it and go in and go here and there. And what's this, and what's that, and depending on is it giving off some sort of energy signature we have to be careful of? So there's a lot that goes into it, before they start drilling in the ground and going down into these things. Because some of these craft, sometimes, we don't understand how it got in granite. How did it get in? Did it just teletransport to the wrong area, and it got stuck? You know? So these things they take very seriously, and it might take years and years before they actually get into it, and this is also happening down in Antarctica right now. They've found many craft. They found a big civilization.

NOORY: Underwater cities?

SMITH: Underwater city. That being said, they have to be careful, because depending also where it's at, how many organizations are involved, how many governments are involved, what's the chances of something leaking out. They're really strict on, right now, like who goes down there. It's also they're putting in a disinformation campaign already down there of getting artifacts from the Mayans and from Egypt, and discombobulate the archeologists that do go there later on and throw them off a little bit.

NOORY: Were you set on retrievals, Emery, because of your medical background?

SMITH: I was I was sent on retrievals only because I had experience on classifying extraterrestrials, classifying devices from extraterrestrials, and working on the extraterrestrial crafts. So I was there more to say, this is what I know about this body. This is what I know about this device. This I know about this craft. Some extraterrestrials, you can't just go up and touch.

NOORY: You could contaminate yourself.

SMITH: Yeah. It's kind of like touching an electric eel, so you got to be really careful. And the science behind all that, with the craft communicating with the devices, communicating with cybernetic organisms that are there, trying to help heal the craft, they have their own thing going on that we are still learning. Like when our plane crashes, we go out. We have our own protocol. Well, they have a protocol too, and also is it transmitting anything? Are they sending for help? Are they going to dematerialize right now? So it's kind of being in a triage field, and you're walking in on a very chaotic situation. It's sad too, because you don't know what exactly happened, especially when there's bodies.

NOORY: Well, I was going to say, have you come up cross ETs that we're still alive but injured?

SMITH: Yes. Oh, yes, many times the extraterrestrials are alive, and sometimes they are communicating telepathically. Sometimes, they're speaking in languages we don't understand. And just like you would try to help someone from a foreign country that just got hit by a car, and you don't understand what they're saying, you know they're in pain, and you're trying to help. It's a very difficult situation to be in when there's a communication problem, because not all of them communicate through telepathic means or speak English, of course. So you have to treat it very sensitive, and at the same time, we're really there. We really want to help this being. We want to save this being and get it back on its feet, but maybe picking it up will kill it too. Or maybe separating it from the craft will kill it, and when we know there's these energy signatures happening, sometimes--they're already preparing to move the craft, no matter what. So sometimes, we'll put the being back into the craft. We notice that

helps a lot, by putting the being back in the craft and transporting the beings and the craft all together at once. There's many documented cases where the craft is trying to heal itself, is trying to form another shell over the shell. And a lot of these craft are formed by sound in space, and they're infused with consciousness from the person, so it's kind of like part of the person, actually.

NOORY: It's alive.

SMITH: Right, it's alive. The craft is alive.

NOORY: It's amazing.

SMITH: It is.

NOORY: It's a biological craft.

SMITH: It's a biological craft, absolutely.

NOORY: The LEGO-looking craft, was that biological?

SMITH: Yes, it was.

NOORY: In your opinion, it was.

SMITH: Absolutely.

NOORY: Tell me about contamination and the possibilities that the planet could get contaminated.

SMITH: The craft are immediately put in these giant, bubble-like tents, and what happens is, if there is any sort of like really bad contamination--

NOORY: How would you know?

SMITH: It could spread. Well, we have these devices that scan the area with frequencies. Remember, I told you about this.

NOORY: Right.

SMITH: That has a database of bacteria and viruses and things like this that we have to protect the planet, regardless, and there have been times where they will sterilize an area. And they will completely vaporize that whole craft, just because there might have been a chemical or a biological agent. That's when they use special energy weapons and other things to vaporize that entire area without causing damage to the surrounding--minimal damage to the environment. It's like a no-fly zone here, because

we're a really evil species. Like anything that comes near our space, we want to shoot it down. So the craft have not been coming so much as they used to in the '50s and '60s, of course, and '40s. Because we have now these neutrino light detectors on the satellites that pick up on different wavelengths of energy, that we can pinpoint where they're at and shoot them down or vaporize them before they get there. And then you have the other extraterrestrials which are highly advanced that can just be right outside the door now--you wouldn't even know it--in their mothership, because it's cloaked and not giving off any energy. So there's many different levels of this technology.

NOORY: It's truly remarkable how we're able to retrieve these craft. And how many are we talking about? Since you know, how many, two, three, a hundred?

SMITH: Hundreds.

NOORY: Hundreds of crashes?

SMITH: Yeah, hundreds.

NOORY: And how many do we knock down?

SMITH: I don't know.

NOORY: Why would we be so hostile?

SMITH: We can't allow the American people to know that they exist, because if they do, then it's going to destroy gas, coal, and oil and big pharma.

NOORY: So when you get onto the scene, and they're alive, what do you do?

SMITH: Well, I first try to figure out if--it's a joint thing, me and two other people are usually the first ones there that walk up after it's been scanned, after we saw all the data. And if there are alive ones there, we will approach the beings, if it's safe for us to, and try to communicate first. And after communication is done, we see if we can offer assistance in any way. We ask questions, if the being is able to communicate. First of all, where are you from, how did you get here, and how can we help the rest of your crew? We ask really basic questions that you would see kind of in pop culture, like you would with someone that got in a car accident.

NOORY: Do you comfort them, the ET?

SMITH: Of course, they know we're there being compassionate. They're not drawing weapons or anything like that. This is a crash. We're not told, this thing crashed or shot down. We don't know when we get there. We're there to establish contact, to

triage the extraterrestrials, and then triage the craft. Triage all the devices that are there, because some of the devices are also alive as well. There's a lot of things going on at one point. Before the team comes in, we have to declare this area safe for everyone to come and do what they need to do. And safe just means you're just not going to walk up and die.

NOORY: Right.

SMITH: From the electromagnetic fields that still might be on or the extraterrestrials if they're known to carry different biological strains of things. We've had many bodies that we worked on--and just like we have like bacteria on our body that's not friendly. We have staph growing all over our body all the time, but our immune systems are so good, we fight it off. So they also sometimes have bacteria and viruses and things. So we have to be careful of that, and even though they might be a healthy ET, it's just like a contamination issue. It's a biohazard, no matter what. So we have to take these beings and escort them to special aircraft that are fitted out with these airtight hyperbaric oxygen chambers inside the craft, and load them in there. And sometimes scientists go in to continue communication and things like that. And then from there, usually the craft is, of course, immediately moved as quickly as possible, if they can.

NOORY: If they can.

SMITH: If they can, if not, they'll stage a big thing to get people out there, like they did in "Close Encounters of the Third Kind," saying there's some outbreak or chemical spill or whatever.

NOORY: To panic us. Do they have blood?

SMITH: Yes.

NOORY: What type blood? Have you ever tested it? O positive?

SMITH: No. No, it's similar to that but not like that at all. We're very similar. They have cells that are used for energy transport, for whatever that is, if it's oxygen and mineral transport, and they have also their own immune system. We classify that very differently than we do our own blood, of course, but it's similar is what I'm getting at. They do have the similar cell-type working cells that do specific things in their body. And sometimes they have other cells that we're not familiar with, that have to do with other things, such as creating energy from within the cell to heal itself.

NOORY: So some of these ETs you mentioned that we shoot down, when you approach them, how did they react to you?

SMITH: First of all, they're worth more to us alive than they are dead for the projects.

And just like in modern-day war, when we shoot down our enemy, and we go pick them up after they parachuted down, we still--if they have any injuries--we still help them get back on their feet. They sometimes don't have a choice, because if they did have a choice, I think they would not be there. They would have left somehow. So I think when they see us come up being compassionate and whatever is happening that they realize that this is--they're very highly-intelligent, obviously. They already know what everyone's thinking that's there. So it's not like there's going to be some secret. They just know, like, we're trying to make an effort to save you, if you'd like to get saved, and that's usually how it goes. I don't think they're judging just yet, because it's someone lending a hand to you, when you're going down the river in the rapids. So do you want to take the hand, or you want to discuss what your intention is first?

NOORY: Good point. Ever been called to retrieve a craft in the ocean?

SMITH: Yes.

NOORY: How do you get them out of the sea?

SMITH: Well, the time we get there, usually it's on an aircraft carrier, on some other ship, where they have already transported it to--

NOORY: It's already been pulled out?

SMITH: It's going to be somewhere stateside at one of the military installations. It's already been pulled out. Right. It's already been pulled out, collected, quarantined to an area until further notice.

NOORY: So you're not in a submarine, and you don't go down there. It's already out of the water.

SMITH: Right.

NOORY: Once you've done to the retrieval, and let's say you have helped save an extraterrestrial, do they bring you back into the picture or what happens?

SMITH: No, the only time I've seen an extraterrestrial twice is it was alive when I saw it at the site, and maybe a month down the road, I saw it in the projects dead. And I've seen the craft more than twice, because they take the craft, put them in areas, and study it and take samples of it.

NOORY: But generally, they don't tap you to come back and help them again.

SMITH: No.

NOORY: On one hand, it's got to be exciting for you. On the other hand, it's got to be kind of sobering. How do you feel, when you're on these retrievals?

SMITH: Yeah. We're adrenalized. We're excited. It's our job. We're going there more as the good guy, to help out, to communicate. It's a time that you're kind of enlightened a little bit. You don't know what happened, don't forget. I'm not allowed to ask what happened. I can ask the ET what happened, and they can share with me some information. But for the most part, it's a job that we're there to do very mission-oriented, and just personally, it's a very exciting moment. It can be very sad as well.

NOORY: Of course.

SMITH: Especially when you see other beings that might be children or pets and things like this.

NOORY: So once you get to a retrieved operation, and it's sealed off, have you noticed that anything environmentally in the area changes?

SMITH: Yeah, absolutely. Once the craft's removed, there are still many samples being taken over the area, and sometimes the area is sterilized, that means vaporized, everything. And even when that happens, there have been times that these areas still had bugs in them, we say. There are still bugs there left that we didn't get, and they mutated with our plant life. They mutated with our insects, and the things out there are changing. I think a lot of these new species that are discovered around the planet everyday are because of some of this happening, of these mutations from otherworldly extraterrestrial craft and extraterrestrials being introduced here. So yeah, it definitely has a huge effect on the environment. And there's a couple of craft in Central and South America, underneath the ground, that have been there for quite some time, that are very small but still operational.

NOORY: And still changing the environment.

SMITH: And the environment is a completely beautiful "Avatar" land.

NOORY: Do they rope off the area after the crashed retrieval has been taken away, and they keep people out of the area for some time?

SMITH: As long as they need to collect samples, or depending on where it's at. Is it a high-vis area? Is it in the middle of a jungle somewhere, where no one goes anyway? They keep it there for as long as they need to take samples and get everything out of there and collect, and then everything just goes back to normal.

NOORY: What do you do with an ET that is saved?

SMITH: I do not know what they do with them. I never went back with a live ET. That's not my job spec. I was only there to--

NOORY: Not your pay grade.

SMITH: Yeah, that wasn't my thing. I was only there to analyze the bodies, the craft, the area of what happened. Communicate with ET, and if I could do that, we would try to save the ET.

NOORY: But then he's carted away?

SMITH: And then he's carted away.

NOORY: And you don't know where he goes.

SMITH: No.

NOORY: Did you ever try to inquire?

SMITH: No. No, you don't inquire.

NOORY: Emery, thanks for being on the program.

SMITH: You're welcome.

NOORY: "Cosmic Disclosure," thanks for watching.

Jason's Fiercest Battle Season 12, Episode 18

Cosmic Disclosure; Invasion of a New World Season 12, Episode 18

JAY WEIDNER: Hey, everybody. Jay Weidner here, and we are back today with Jason Rice, continuing his narrative. Hey, Jason. Thanks for joining us.
JASON RICE: Thank you for having me, Jay.
JAY: Last time that we were talking to you, you just finished deployment on a planet you called Planet One, where you were fighting these ferocious creatures. And you described to us the Darwinism of your situation and how they were manipulating everybody--the--the Dracos and the cabal were manipulating everybody into creating a kind of New World Order fascist state in a way, with a banking system and a fiat money system, and a society more like what we would have in Europe and America today, I would say.
RICE: That's correct.
JAY: So let's talk about the next place that you went. You were being taken from Planet One. And did you go on a ship and then go to Planet Two or receive new orders? Was there anything in between that occurred that we should know about?
RICE: Nothing of note in between. When you're given the orders to pick up and leave, everybody packs their stuff, puts them on the shuttles, and the shuttles go and meet up with motherships. And motherships take us from one system to another. Where that other system is and how far it was between Planet One and Planet Two--which the name that I recall is Callidus Three--I had no idea how far apart they are. It could be 1,000 light years, or it could be from a stellar standpoint right next door.
JAY: So you got on a shuttle and they took you to the mothership. What did the mothership look like?
RICE: The particular motherships that we used for interstellar travel varied. There were cigar-shaped ships, and there were wedge-shaped ships. They were both capable of interstellar travel. In this case, it would have been the larger cigar-shaped ship that we would have packed up my unit on and all of our assets and gear and equipment, because the smaller wedge-shaped ships were not specifically designed for a large contingent of ground troops.
JAY: So how many troops were inside this cigar-shaped ship?
RICE: Each of the cigar-shaped ships had room for 2,000 to 3,000 ground troops.
JAY: Plus all the equipment?
RICE: Plus all their gear and equipment.
JAY: There must have been massive like, uh, eating facilities and--
RICE: Mm-hmm, cafeterias, workout areas, quarters for officers, quarters for the enlisted, anything that a division of troops would need.
JAY: Again, very closed quarters?

RICE: Yes. And in fact, the ground troops, us ground pounders, were isolated and kept isolated from the naval personnel. We had our own section of the ship that we operated and worked in, and we weren't allowed outside of that area of the ship. If we did, we would be subject to any number of things short of death.
JAY: Do you have any idea why that was happening?
RICE: They wanted to keep information compartmentalized. If we had gotten outside of our areas, there was a chance that we may have started snooping, OK, where are we? What are they doing? What other information do we have? The other side of that is that the agreements between the Cabal and the Mars Germans required that the Navy and the ground troops were separated because there were elements of the ground forces that the Cabal didn't want the Mars German Navy to be aware of, specifically the strategically placed ammunitions, or munitions, in the event of the self-destruct.
JAY: So you guys had an, um, ancillary plan that if things got bad you would destroy everything?
RICE: That's correct, including the self-destruct protocol buried within each of the nanites on each soldier.
JAY: Would the Germans--if they found out about this, would they be not very happy?
RICE: They probably knew about it.
JAY: How long were you on this cigar-shaped craft before you arrived at the next place you were going?
RICE: I don't remember.
JAY: And you called this planet Callidus 3?
RICE: Mm-hmm, Callidus 3.
JAY: And is that the name that the indigenous people had for their planet?
RICE: That was the name that we called it. When we first arrived, there were about 4 billion inhabitants on the planet. This planet was about 4% or 5% larger than Earth. Gravity was comparable. It was a little more than standard Earth but is still within acceptable tolerance levels for us to adapt to. Having the nanite enhancements helped because it strengthened our bones and bodies where we needed to have them strengthened. And again, 4% or 5% isn't that much.
JAY: Right.
RICE: When we first arrived, another thing I can tell you about the planet is that it had four moons. They were all smaller than Luna, Earth's moon. We called them Moon 1, Moon 2, Moon 3, and then Moon 4. Moon 1 was like a dark gray. Moon 2 was like a white color. Moon 3 was like a burnt orange. And then black, so it was the hardest to see and find.
JAY: Why did these moons have different colors, do you think?
RICE: I believe it had to do with the materials that each of the these bodies were composed of. The burnt orange, for instance, was probably very high in iron. The black was probably more of a carbon. The white was probably some of the same material that you'd see on our moon right here on Earth. And the dark gray, your

guess is as good as mine. Maybe--
JAY: It could be a granite or something.
RICE: Granite or more titanium. I mean, who knows?
JAY: So we want to talk about the indigenous people.
RICE: Yes.
JAY: What were they like?
RICE: The indigenous population there numbered, again, about 4 billion when we first arrived. The planet itself--again, no salt water. It was all freshwater. It composed about 70% landmass, and then the other 30% was the freshwater. So it had a much larger landmass than we're accustomed to here on Earth. And again, started seeing the pattern. It was--they were looking for, just beginning their industrial age, civilizations that they were in, because that was where they were able to offer--dangle the largest amount of fruit in front of their eyes. The people were shorter than standard humans. They didn't look much different than humans you see here on Earth. The color of their skin seemed to comprise mostly shades of white or olive.
JAY: And were they the only inhabitants of this planet?
RICE: They were the only inhabitants.
JAY: Besides the animals and things?
RICE: Mm-hmm. They did have some livestock that they used. Their cattle was much shorter than the cattle that we would see here on Earth. They were much more stockier. So if you can imagine a shorter cow with larger diametered legs, kind of like what you would expect to see on an elephant, actually--
JAY: Really?
RICE: They were just stockier necks, more squared off jaws and noses. The goats that I saw--I call them goats. I mean, that was about as close as you can get to what they looked like. But I mean, again, they were smaller, stockier, heartier, more squared than what we're accustomed to seeing here.
JAY: Again, what was the purpose of you being on this planet?
RICE: Our purpose on this planet was the same mission that we had on Planet One, which was to help train the local indigs on how to defend their planet, on training them how to fight the invading--
JAY: Hopefully not the werewolves again.
RICE: Well, we weren't sure. We didn't know. Again, intelligence was spotty, and that was deliberate. But we knew that the opening stages would entail kinetic energy bombardments. And so that was, for us, our first telltale to be on the lookout for. But we were there to fight whatever it was that showed up.
JAY: Very similar scenario.
RICE: Very similar scenario.
JAY: So this is the SOP. You're going to take a certain kind of population, and you're going to change it.
RICE: Mm-hmm, yep.
JAY: Into what they want it to be.
RICE: Into what they want it to be, force them through attrition of their own

population to accept the terms that are given to them.
JAY: Going back to Planet One, from the time you started to the time you finished, it would be fair to say that the entire culture of that planet had been altered forever.
RICE: Changed.
JAY: And so on Planet Two, did the same scenario pan out?
RICE: Same thing played out.
JAY: On this planet, there was an invader coming, just like the other scenario.
RICE: Just like the other scenario.
JAY: And they used kinetic weapons on the poles and everything? Or what?
RICE: They used it on the poles to raise the sea level to flood out the coastal cities.
JAY: So you're thinking it's the werewolves coming.
RICE: Yes.
JAY: Yeah, and you're prepping for it?
RICE: We're prepping for it, and we're spreading out and defending our areas and putting up the defenses and mines and trenches and the defensive structures--you know, the typical defensive technology that's employed by the military using some of the advanced tools that we were allowed to use. I will say that they limited how much technology we could use with the indigs. They did not limit the technology they use to defend the division headquarters. So any time that they had--the brass was threatened, they had no problem with pulling out. And that was one of the signs that was, to me--you know, there's a lot more going on than some of the subtle signs that you see.
JAY: So were you involved in the first altercation with these invaders?
RICE: I have not recalled that I was involved with one of the first altercations that--
JAY: But you were involved in an altercation.
RICE: I was involved in many, over the almost six-year period that I was there.
JAY: So you fought on this planet for almost six years?
RICE: 52 months.
JAY: 52 months. When they invaded, the rumors and the intel began spreading about who you were fighting against.
RICE: Yes.
JAY: So you knew before your first altercation who you were fighting against?
RICE: We knew before my unit, my personal unit, got involved in combat that it was not the werewolves. There was something different.
JAY: What was it?
RICE: We still had no idea at this time, except that it was quadrupedal, it was very fast, and it was about the size of a grizzly, spiked around the neck, a large mouth, and inhumanly fast.
JAY: And what kind of animal creature was it, a robot?
RICE: It was a created being, again. And it seemed to comprise a number of different systems from--probably crossbred from a number of different lifeforms, taking whatever it is that they needed to augment this particular life form to fit the purpose and suit the needs that they had.
JAY: Is there any creatures on Earth that resemble?

RICE: No. None. If you can imagine a demon that's got four legs and spikes coming out of its neck that travels in packs in large numbers and can move about the speed of a spider.
JAY: A giant spider?
RICE: Yeah, very fast.
JAY: And it was built for combat?
RICE: Built for combat.
JAY: Weapons?
RICE: No weapons.
JAY: No weapons.
RICE: Claws, teeth.
JAY: They were the weapon.
RICE: They were the weapon.
JAY: It must have been fairly easy, then, to them out as they were approaching, right?
RICE: No.
JAY: Tell us about it.
RICE: When you've got an alien species that seems to have some type of embedded armor as its skin, small arms aren't going to do it. So you have to resort to larger caliber, which means that standard humans--you're limited by how much ammo you're going to be able to carry. So again, you get to the basic load out question. How much are you going to be able to carry? How much are you going to be able to supply each person with? So it becomes, OK, we need these larger weapons in order to take down this particular enemy. And in a lot of cases, we ended up spreading around larger crew served weapons. And so instead of having now 500 in a unit that are individual fighters, you've got, say, 60% of that because you're having to combine people into crew-served teams so they can have a standing chance of being able to take out this particular enemy.
JAY: So a large percentage of the people were being used to carry ammo and not really being able to be used in combat.
RICE: That's right. That's right. You now have a crew-served weapon that takes two or three or sometimes four people. That's one single firing point instead of two or three or four separate firing points.
JAY: And that's because the weapons that you were using had to be of a certain size in order to defeat these things?
RICE: That's correct. The weapons we were allowed to use.
JAY: Right.
RICE: So they limited that. That was a particularly bad sticking point. At that point, I had made Company Commander, and so I had a large number of people that I was responsible for, and I wanted to make sure that I provided them with the best means possible for defending themselves and being able to keep them alive. And so I didn't like it. And I was told on a number of occasions, suck it up and do what you have to do. And so we got creative on how we used the existing munitions or ammunition in

employing them in the beginning stages. Later on, when losses started adding up and we were really pushed against the wall, they lightened up on that. And I think it took losing a couple of generals before they were able to do that.
JAY: So you were losing the war.
RICE: Oh, yeah. They didn't take any prisoners, no POWs. Again--
JAY: Fought to the death?
RICE: Fought to the death, would not be taken prisoner. Again, it was a matter of, they would not leave an area until every life form was extinguished.
JAY: You eventually found some weapon that worked, then, against them.
RICE: It took antimatter.
JAY: Antimatter?
RICE: Large antimatter mass destruction bombs.
JAY: What--describe that to me.
RICE: Well, part of the issue--and we talked about this with Planet One--is that the Navy were responsible for defending the planet and the solar system. And so what changed on this particular planet was that the number of Naval engagements rose exponentially, which means that the number of landings increased.
JAY: And these would be the Mars German Navy.
RICE: That's correct. Our canners.
JAY: Right. And they were now losing battles against these creatures also.
RICE: Were taking higher losses because they're--
JAY: And that made them get more serious about how they were going to fight back?
RICE: That's correct. Eventually, we were able to start using antimatter explosives and strategically placing them on our defensive perimeters so that we could ambush any of the invasions that would come in in the attacks. So we would essentially set up ourselves as bait so that they would come in in large numbers, and then we'd destroy them.
JAY: So ambush them.
RICE: Ambush them.
JAY: And describe the antimatter weapons.
RICE: It has all the flash and bang of a nuke without the bad side effects of nuclear radiation afterwards.
JAY: Really? And over a wide area?
RICE: Over as large an area as you want.
JAY: So you can control how much damage was being done.
RICE: Yes, you could have antimatter that is the size of a pea and take out a block, or you could have antimatter that was a couple of pounds, and something that large is going to take out multiple states-sized areas.
JAY: Could you take out a planet with antimatter?
RICE: No doubt. You could destroy an entire planetary surface with antimatter, if you so desired.
JAY: These creatures that you were fighting, did they have ships?

RICE: If they did, I never saw them. They came in on mass landing craft that would slow down and stop and land, and then they would come out en masse.
JAY: So they had like cargo ships or something?
RICE: They had cargo transport ships, but not like combat shuttles.
JAY: And did you know who they were working for?
RICE: At that time, no.
JAY: No.
RICE: No, did not. We had no intelligence on what their ultimate goal was other than destruction and death. We had no intelligence on where they came from or what their home planet was like or who sent them or why they were picking on this particular planet. Again, that was information that I had pieced together later, which is part of this false flag.
JAY: Were you beginning to get the drift, though?
RICE: I had started getting the picture on this planet--that was when my good friend Johan had informed me about the history of the Mars Germans and the Cabal on Earth.
JAY: So that happened on Callidus 3.
RICE: Callidus 3, yup.
JAY: That's where you met Johan.
RICE: I knew him from the original training at the Fi. But that was where he had told me about the true history.
JAY: So the massive download happened at this time of your second 20?
RICE: Mm-hmm.
JAY: Interesting.
RICE: Yeah, that was when I found out the history of the Mars Germans and the breakaway civilization and the nuclear demonstration strike on the lone US Navy heavy cruiser in the Pacific and the theft of the mind-wipe technology and the destruction of the Challenger and Chernobyl. And that was when I found out a lot of some of the history of Earth that was not told to us.
JAY: So you fought for almost six years on this planet against these invading creatures. And you nearly lost.
RICE: Oh, yes, several times.
JAY: Several times. But the antimatter weapons eventually were what saved you?
RICE: Once they gave us the green light on being able to use those, we started incorporating them into smaller and smaller packages so that we weren't interested in taking our own lives. We were trying to protect ourselves and the civilians that we were in charge of. So we were able to get it down to a grenade-sized device, and we were able to use it in a launcher, specialized launcher, so that we could then--you know, we didn't have to be up close and personal. But aside from the small unit employment of antimatter, we were also using it on a larger scale to try and take out the enemy bases. And it came to a point where at the end of the war, there was a time where we had to use larger size antimatter. And I remember being in a bunker and

watching this go off, and there were people in that room that didn't think it was going to work, that were convinced that we were going to lose, and that every person in that room was going to die and that we were not going to be able to save this planet--or that planet, at the time. So the employment and the use of those large antimatter was the turning point for us.
JAY: So you destroyed the bases of these creatures.
RICE: We destroyed their bases on a large scale.
JAY: Did a lot of the indigenous people die in this war?
RICE: There were 4 billion people on the planet when we arrived, and there was about a third of them left by the end of the war.
JAY: Again, the same thing? Devastated place?
RICE: Devastation from one side of the planet to the other. And in fact, some of the areas that we'd used the antimatter explosives on had been abandoned. Clearly they weren't going to be used anytime soon. We went through the process of rebuilding the planet and getting them back to a state where they were able to have a civilization that they were able to continue on.
JAY: So did you guys have friends among the indigenous population?
RICE: Yes, yes. We ended up getting really close with a lot of the indigenous populations because we were fighting beside them. You know, it's not like, hey, we're going to be here fighting and then we'll see you later. Well, if we lost, we were all dead. And so that tends to bond people together on a very strong level. And so--and they were such nice people. You know, unfortunately we came along. But they had a great civilization. Again, it was based on bartering. They had their own rich culture, religious beliefs, spiritual beliefs. They didn't have much in the way of wars or fighting. They had established a long-standing peace. And so how can you not like people that are open and genuinely caring about their neighbor or the person they're two streets over?
JAY: Any of you have any love affairs with any of the indigenous?
RICE: Let me just say that the commanders' policy was that any of the relationships that we had with the indigenous populations, they encouraged us to embed ourselves into it because they felt that we would be able to gain more from that. But the policies were that we were not allowed to have that affect our command decisions. So yes, there were people that had relationships with some of the indigenous populations. Did it cause or pose any problems? No. Again, keep in mind that every person that was from Earth that was there was enhanced. And so as an enhancement, and as an intuitive empath, the people that you're most connected to are the ones that are in your unit. And so establishing a romantic relationship with some of the indigenous populations--did it happen? Yes, it did. Were they long lasting or long standing? No, they weren't.
JAY: So the MO was clear. They're modernizing, unquote, these planets and then bringing them into the Cabal system and creating a kind of an empire?
RICE: Establishing a local Cabal, and those elites that are going to be in charge of that particular system, probably establishing advanced technology research and

development that separates the two classes of people from the elites to the common people. Sound familiar?
JAY: Yep.
RICE: Part of our job was co-opting some of the local leaders and getting them involved and getting them to agree to the requirements of our help.
JAY: And I would say that the people doing this probably thought that they were helping.
RICE: They were convinced that they were helping. They had no idea. And, you know, in all honesty, neither did we. We had no idea about the long-term goals of what was planned and that they were going to be turning these planetary environments and civilizations into proxies, into controlled systems. We had no idea about that.
JAY: So had these peaceful people on this Planet Two, had they been involved in war before?
RICE: No. When the Mars Germans came along and made this proposition to them, they certainly showed them what information they wanted them to see as far as the progression of these alien invasion attacks, in order to further their false flag narrative. And they would have shown them, OK, look, this is the system that's neighboring that was attacked, and you have X number of months before you're next on the list. And so, you know, you have a choice to make. We can help you, or you can suffer the consequences.
JAY: So the humanoids on Planet number Two, you've described them. Do they have the same facial characteristics and things that other humanoids have?
RICE: Yes, it'd be the same. In fact, you know, we had talked before about why we think that there is so much widespread human-looking beings throughout our particular galaxy. And I happen to believe that, you know, each of the planetary bodies are conscious on some level. And so the blueprint of the human shape, with the star pattern, two arms, two legs, a head, and asymmetric along the center line, that's something that is a blueprint for our logos. Now, are there other areas of creation that have something else that's going to be more common? You can count on that being the case because, you know, there is life far beyond the extensive anything that we could ever even imagine. And so, you know, seeing humanity on another planet within an area that we can get to, or something that resembles humanity, is something that we could expect, at least in our logos.
JAY: I want to thank you, Jason, for being brave enough to come on our show.
RICE: Well, thank you, Jay. I really appreciate you having me here. And you know, again, this is all about disclosure.
JAY: It is. And I'm Jay Weidner, and thanks for watching.

Jason's Fiercest Battle Season 12, Episode 19

Cosmic Disclosure; Jason's Fiercest Battle Season 12, Episode 19

JAY WEIDNER: Hey everybody, Jay Weidner here. We are back today with Jason Rice, who purports to be in the Secret Space Program. Hey, Jason.
JASON RICE: Thank you, Jay. Appreciate you having me here.
JAY: Yeah, it's been great. So let's get back to--you were just finishing up your duty on Planet Two. Again, it was the same kind of false flag scenario of the Cabal, using conflict and post-conflict to have things go their way. And you served almost six years in this dire situation. Eventually your side overcame the enemy through the use of high tech weapons, and now you're done with that planet. What happens next?
RICE: What happens next is the aftermath, there are units that remain on the planet to help with clean up, reseeding, restarting their civilization in the ways that those in charge, the Cabal, want to have it done, that best suits their needs. And when we say the Cabal, we also mean they are puppets as well of the Draco and the AI. So setting the planet up takes more time. And our work there, being done, they redeploy us to another planet--
JAY: Oh, no.
RICE: --to repeat the process, Planet Three.
JAY: Did it have any other name?
RICE: Not that I recall, yeah.
JAY: And so what was the situation on this planet?
RICE: This planet was unique from the other two. And Planet Three just so happens to have had three distinct races on the surface of that planet.
JAY: Indigenous?
RICE: Indigenous from the standpoint of, as far as we knew, they had originated there. The chances are, of three separate species as widely different as they are having originated on the same planet, I have suspicions that they did not, and that there was at least one or two of them that originated elsewhere and were either seeded or brought or transferred there.
JAY: Can you describe these three races?
RICE: Sure. The first race would be human-like, very similar to any human you'd see out and about on Earth today. The second race was an insectoid-like race. They were about 3 and 1/2, 4 feet tall. They have an oval-shaped head. They have silvery, round-shaped eyes. They have very small mouths, very small noses, almost no to zero ears. They're telepathic, and they communicate telepathically. Their teeth are very sharp pointed teeth. They have reverse jointed legs.
JAY: They stand up on two legs?
RICE: They stand up on two legs. At some point in their past, they crawled as well because we saw evidence of them crawling or walking on walls and ceilings.
JAY: Really?

RICE: They had that ability still.
JAY: Because they're an insect, they look more like than another insect on Earth?
RICE: No, nothing like them at all in our cornucopia of insects.
JAY: Not praying mantis or--
RICE: No.
JAY: --ants?
RICE: They were round faced. They had shoulders, arms. Their arms were longer than the typical.
JAY: What was their skin like?
RICE: It was like a green, light green, yellowish green, semi-transparent.
JAY: Really?
RICE: In that you could see into it a little, but it wasn't like looking through glass through their lens.
JAY: Translucent kind of.
RICE: Yeah, kind of translucent. Then the third race being a race of cyclops.
JAY: Cyclops? One-eyed humanoids?
RICE: One-eyed humanoids.
JAY: So do they have any peculiar characteristics besides having one eye?
RICE: That was it.
JAY: These three races did not get along?
RICE: No, they did not, which meant our job of trying to unite them and get them as a combined front was that much more difficult.
JAY: So one more time, there's an invader coming. You've been sent in, you and your guys. And you made friends with the indigs, only the indigs are now three different populations.
RICE: Yes.
JAY: Who were the most difficult?
RICE: The insectoids.
JAY: Insectoids, why?
RICE: They didn't trust any humanoid, period. In fact, one of the first instances where I was trying to arrange a meeting with their equivalent of the mob, they had criminal elements that we were trying to get involved with as far as arranging coordination. And I was to meet with one of their mobs, the insectoids, and was taken into a cave area and was taken prisoner.
JAY: Really?
RICE: Yeah.
JAY: Why did they take you prisoner?
RICE: They didn't trust humans or humanoids.
JAY: So you were foolish enough to go into their area, and so they arrested you.
RICE: So they were supposed to meet me, but it was a trap. And they thought that I was there just to spy on them as part of one of the other humanoids.
JAY: And how long did you spend in jail?
RICE: I was three days a POW before my comrades came and rescued me.

JAY: Well, at least this group takes POWs.
RICE: Yes.
JAY: The other two groups that were before did not.
RICE: Did not.
JAY: And everything turned out OK after that?
RICE: I spent three days as a POW and was tortured and beaten.
JAY: You were?
RICE: And spent a couple weeks after that recovering, even though physically I had healed within the day of the wounds that they had given to me. It still took me a couple weeks before I was ready to get back and go into the field.
JAY: And how was it finally resolved?
RICE: They were able to get most of the populations onboard. When I left Planet Three, it was following a shuttle crash. The shuttle was brought down by indigenous fire because, again, they didn't trust us. And it was the insectoids that had taken shots at the shuttle that I was on.
JAY: And they brought the shuttle down?
RICE: They brought the shuttle down.
JAY: And you were in it?
RICE: I was in it, crashed, suffered a tremendous amount of physical damage, and was medevaced to what they told me was Mars. I have strong suspicions that it was, where they replaced two of my limbs and repaired the third, and I spent the next eight months learning how to reuse my limbs and reconnect with the nanite enhancement therapies. And following all of that therapy and treatment, I was then reassigned to a new unit back on Callidus Three for part of the cleanup operations, the retraining, the rebuilding.
JAY: So you had been in a battle or something, or were you just taking the shuttle as a ride?
RICE: I was catching a ride from one part of the planet to the other. The enemy invaders had not arrived yet. I'd been on the planet about 15 months and had run a number of missions in which we were trying to, again, get buy in and gain confidence. There were problems with smuggling, and they had a larger criminal element on that planet. And some of the criminal elements had taken to trying to steal technology.
JAY: From you guys?
RICE: Well, from some of the other elements of the planet. There were humanoids and the insectoids and the cyclops, and so getting them involved with defense preparations and building up arms and stockpiles. And some of it involved very, very mild technological advancements. Well, anything that was above their standard base was immediately a black market item. And so we started noticing that some of the weapons that they were building started disappearing. And so we were investigating that.
JAY: Who was the most advanced of the three races, as far as technology?
RICE: They were all pretty even--even as far as where they were at technologically.
JAY: So the cyclops had high technology for that world?

RICE: Well, they were all three about the same level, the cyclops, the humanoids, and the insectoids. There was no one that was more than the other because they'd been at war off and on for a couple of centuries.
JAY: So there were skirmishes on the borders?
RICE: Skirmishes on the border. They'd reached a tentative peace agreement, and then it lasted for 20 years. And so they had armaments.
JAY: Do you know what the wars were about?
RICE: Race differences.
JAY: So you arrived on this planet and there's practically a mini civil war going on between three factions.
RICE: Correct.
JAY: Your job is to unite these people and get ready for an invasion of something. By now, you're not sure what's coming because at first, you thought they were going to be the werewolves. So now, you don't know what's going on.
RICE: Yeah, we have no idea what's going to be coming. And again, a deliberate intelligence blackout. If they knew, they weren't telling us.
JAY: And these people have weapons already?
RICE: They did.
JAY: So you didn't have to worry about that part.
RICE: They had projectile weapons, chemical weapons from the standpoint of chemicals being black powder.
JAY: How did you finally unite them?
RICE: I don't know how they did. I was gone by the time they would have united them.
JAY: Oh, that's right. You got wounded. So you really didn't see much action then.
RICE: Most of the action that I saw on that planet was related to the working with the indigenous, training them, going out to remote villages or remote cities, getting them prepared, so a lot of the same things that we'd done before--helping them with stockpiling and helping them to get organized and be more efficient in their agricultural operations or planning out fallback positions, those kinds of things.
JAY: And while you were there, did you ever make peace with the insectoids?
RICE: No, I never went back.
JAY: You never went back. You don't know?
RICE: No.
JAY: OK, so you were in the space shuttle minding your own business, and the insectoids hit you with a missile or what?
RICE: They didn't trust our presence there. And so we were humanoids, and immediately we were enemy, persona non grata. And so our efforts at trying to get them united with the rest of the planet were not working. And so when they're afraid and scared, their first response was to attack. So that was what they did, was when they saw us, they would try and attack us. They took me prisoner. That was one of the first interactions that my unit had had with the insectoids. And from what I

understand, there were similar occurrences in other parts where the other people were trying to reach agreeable outcomes with the insectoids.
JAY: So we never know what happens to this planet, do we?
RICE: I don't.
JAY: Sounds like a rough ordeal.
RICE: Oh, it was--the decision I made not to go back was based on--it was definitely a nightmare amongst the nightmares.
JAY: So you got blown up. The space shuttle got blown up. Did people die in this total explosion?
RICE: Yeah.
JAY: But you fortunately didn't, but you lost limbs. And they medevaced you back to Mars, where they used advanced technology?
RICE: They used advanced technology to regrow and reattach limbs.
JAY: So you regrew your arm?
RICE: Yes.
JAY: Wow, that's amazing.
RICE: It was. And unfortunately, the process is not perfect. Again, they're not God.
JAY: So it didn't totally heal it up?
RICE: No. They fixed the bone. They replaced the bone, but the tissue, the nerves, some of the softer tissues--it's still not a perfect science. It's a lot better than the conventional medicine that we have here.
JAY: And you're still alive.
RICE: And I'm still alive.
JAY: So you got medevaced to Mars. So you're back on Mars. What was that like?
RICE: I don't remember most of it. I was in a coma for a lot and under the medical treatment. And then once I was out of the coma and started going through the therapies, a lot of it they use, which is another great benefit of augmented and virtual reality, is being able to use it for medical treatments. And being able to use it because during the process of the therapies, they're able to isolate signals between your brain and different parts of your body. So they can help you with identification of limbs that are newly attached or learning to reuse limbs or reacquire the use of muscles or muscle groups.
JAY: So you finally got better, eventually.
RICE: I did.
JAY: And one more time--
RICE: Back into the--
JAY: Back into the fray. And this time, you went back to Planet Two.
RICE: I went back to Planet Two, Callidus Three.
JAY: Which is a cool thing because you're going to see the results of what happened here.
RICE: Yeah, I got a chance to see close hand what some of the rebuilding efforts were involved, some of the effects on the native population, how the people really felt.

When after the end of the war and they're not being invaded and faced with imminent death, what do they think? How do they feel about it?
JAY: And?
RICE: There were mixed feelings. We had some sabotage issues. One of the shuttle ports was destroyed completely.
JAY: By the indigenous?
RICE: By the indigenous population, had sabotaged one of the fusion bottles on the shuttle. And when those things go, I mean, it will destroy just about anything and everything nearby. So it's an antimatter explosion.
JAY: And why did they do that? They're angry at you?
RICE: They were angry at what was happening to their civilization, understandably. I mean, their entire world had been turned upside down, shaken, stepped on, and rebuilt.
JAY: And you taught them how to kill.
RICE: Yes.
JAY: So there's got to be some feedback on that too.
RICE: There's going to be some backlash on that, yeah, absolutely.
JAY: Anything else that you discovered on your return?
RICE: Another thing on my return is the sudden appearance of livestock mutilations.
JAY: Really?
RICE: Really. It was one of the most bizarre things that I'd come across in the aftermath of the rebuilding. At first, we were worried that the enemy had returned. No. It was strange livestock mutilations out in the middle of nowhere, all the fluids gone, strange mutilations on the body, no signs of wildlife or anybody or anything else in the area, and the sudden appearance of what I believe were either etheric entities or another ET race that was there.
JAY: That was doing the--
RICE: That was doing this.
JAY: That's all you ever found out, was one of these two and that was it? You don't know why they were doing it?
RICE: Don't know why. I suspected it was for psychological reasons. They wanted to torment some of the population that was there, and that was one way of doing it.
JAY: You think the cattle mutilations that happen on Earth are for the same reasons?
RICE: I strongly believe that. Because of some of the negative consciousness, that it gets seeded into the human population through those experiences.
JAY: So what was life generally like now? Before semi-rural, this was all upended by the war. So now, what is life like on this planet?
RICE: It was very much a rebirth of a phoenix, if you will, of a civilization. They came from their plowshares to building cities and starting to build off-planet installations in orbit. And helping them do that and seeing that, it had its rewards in and of itself, seeing them rebuild and restart, jump-start their civilization.
JAY: So they became a spacefaring race?

RICE: They did.
JAY: Wow. That's quite a thing.
RICE: Yeah, well, they were all still controlled.
JAY: But still to advance that quickly, that's--
RICE: They were helped, very much so. But to advance that quickly is something else. But you look at the advances that we've made here on Earth just from the 1930s through the '40s before things went black.
JAY: Very similar.
RICE: Very similar.
JAY: Anything else that you noticed about this new society that is worth repeating?
RICE: Their social structures changed--very regimented, almost militaristic. There were a lot of things that I was proud of in seeing get rebuilt and renewed, but seeing those kinds of changes was not one of them.
JAY: So they were building up their military?
RICE: Whether they're building up their military or not, seeing a civilian population get regimented, even if they're not in uniform or building up weapon systems, it is somewhat disturbing. It's very Orwellian, and to see an almost police state created.
JAY: Fair to say that that was the point?
RICE: It was.
JAY: How long did you stay on this planet trying to help out this time?
RICE: I was there helping with the cleanup and rebirth operations for another couple of years.
JAY: Two years?
RICE: Mhm.
JAY: And was the population happier or sadder than it was when you arrived the first time?
RICE: Both. There had been a tremendous amount of deaths after the war, and so there wasn't a single person on the planet that hadn't lost. And so there was that underlying sadness, and how do you recover from that? That takes probably a generation or two before those kinds of wounds get healed. So there wasn't a single day that went by that people weren't reminded of the losses, even though they would see new things or things being built and repaired, and things getting new or better. So there was both happiness and sadness there. And of course, we felt it. We saw it. And you can't help but feel for them, at least I did anyway. And I know that the soldiers that I worked with that were part of my unit were of the same mind, and that was one of the driving factors for us was to help improve that, to help whatever way we could to make it better.
JAY: Could you rekindle any relationships that you had from before when you came back with the indigenous?
RICE: No. They had me in a completely new place, new area, new people. The people there were, when we first arrived, were very open, caring, thoughtful. They'd give you the shirt off their back without a second thought. They had no subterfuge. When I returned as part of the rebuilding process, it was realpolitik. It was in full force--

backstabbing, political moves, and intrigue, and this person doing that bad thing to that person. Some of the worst political fraud and events that you see in the mainstream media today, that was what they'd learned, unfortunately, and part of the plan.
JAY: So in the end when you did finally leave the planet after helping to rebuild, did you feel that it'd been a good thing or a bad thing that you had been involved?
RICE: I felt good in that I'd helped them to rebuild a number of the things that they'd lost. I did feel the loss from seeing all the realpolitik, seeing it in action, seeing it born, watching it rise and take hold of all their leadership. Whereas before, they would work together cooperatively without any thought or care of any repayment. It wasn't like that when I left.
JAY: Was it top down?
RICE: Yep. And so seeing that was disappointing.
JAY: So did the indigenous turn on you when you returned?
RICE: No, they did not. When we first returned to help them rebuild, there were units specifically dedicated to going around and policing up some of the technologies that were left on battlefields from one side of the planet to the other. Their jobs were to collect not only the dead aliens, but also the dead human or humanoids, or mark, at least mark their location so that any families, if they were surviving, would know where to go for the remains. Part of the job was to collect technologies that were spread and laid out and strewn everywhere from one corner of the planet to the other. There was a huge black market in the technologies, the alien technologies, alien biological life, and planetary government was real worried about collecting all of that and having control over it. So the people that were still there, because they did develop a burgeoning underworld, if you will, a criminal element for these black market items, the people that we dealt with were very interested in making sure that they didn't take control or get control.
JAY: So these indigs had a barter system before, but now they've developed a black market. I guess that's an indication of the economy deepening.
RICE: The economy deepening and broadening. The supply and demand economy that they've been set up with was based on manufacturing goods and manufacturing in an economy based on a fiat currency, in which you worked, you made money, and you bought things. You worked, you made money, you bought things. Well, what if you can't buy something, or what if you want something that's not readily available? Well, now, they've had their eyes opened to, what are these alien things? What can they do for us? And maybe we can tinker with them. And so that was the bulk of the black market and what they were interested in doing. I suspect that there were off-planet corporations that were extremely interested in attaining additional alien biological stock, as well as alien technology. We boxed up, by the thousands of tons, of alien biological samples, as well as alien technology, and shipped it off planet. They told us it was going to R&D bases on Mars. I can guarantee you that was not the only place they went. And so my suspicion is that there were also corporations there,

probably from Earth and/or Mars.
JAY: So were you given special training before you went to these planets to make sure you blend in better?
RICE: Yes. Part of the training regiment that we went through before planetfall included a tremendous amount of time in neural education chairs, in which we were downloaded the language. We were downloaded what they called a package. And it included the intelligence that they were willing to share with us about the civilization, the people, and as part of that neural download included some of the things that we would go through or that were regional.
JAY: Cultural.
RICE: Cultural sayings, information.
JAY: Clothing.
RICE: Clothing.
JAY: Art.
RICE: Art, yeah, the dos and don'ts, nuances, as far as what they knew. Now where did they get this information from? I suspect that they probably got it from the Draco, who'd been there for a long time and at least had feelers out to be able to have collected this information.
JAY: We know the Cabal doesn't trust the Mars Germans, and we know the Mars Germans don't trust the Cabal. They're in an uneasy alliance, clearly. Is there a chance of a war breaking out between the two of them?
RICE: Yes. And I would say that the fact that the Mars Germans still called the Cabal Earth [INAUDIBLE] royals is plenty enough. Now the protocols preventing the use of Earth troops against Earth, I certainly hope that that would never come to pass. But I can tell you that the blockade that is preventing the passage of ships into our solar system, at least until the near future, decides what and where and how things are going to happen, would prevent a bulk of their navy from coming and taking part after the event or the changes that we expect to happen sometime in the next decade or so. Who's to say? What happens then? Will humanity be united? Will it not matter that there is a breakaway civilization that lives on Mars? I don't know. Those are questions that we need to address. My suspicion is that there probably are a lot of things going on now. The animosity between them has always been kept barely contained because one believes the other is below them or beneath them. And so those battles that are ongoing, are they between Earth's SSP and the Mars Germans, or are they between German factions? Because not all the Mars Germans are spiteful of Earth. My friend Johan is a clear example of that, and I had met others. Granted, they were a small percentage of their military, but they're there. You can't judge all of them by that.
JAY: We got to be careful because things are not as monolithic as we think they are.
RICE: They are not.
JAY: It's easy to think that way, but it's not right.
RICE: No. No, it's not.
JAY: Do you think you have someone watching over you?
RICE: No, I know that the creator is watching over me every second. And part of my

mission has been to experience the things that I have and to tell the stories of those that gave the ultimate sacrifice, as well as those that have come back and just don't remember it. And that's my mission as part of what I'm here for.
JAY: Well, Jason, it's been really great having you on. Thank you.
RICE: Thank you for having me. It's all about disclosure.
JAY: It is.

Portals Connecting the Cosmic Highway Season 12, Episode 20

Cosmic Disclosure; Portals Connecting the Cosmic Highway
Season 12, Episode 20

GEORGE NOORY: Well, welcome to "Cosmic Disclosure." I'm your host George Noory, and I'm here with Emery Smith. Portal technologies, are they natural or man-made? Emery, welcome back to the program.

EMERY SMITH: Well, thanks for having me George.

NOORY: You do a remarkable job investigating some of these very strange and unusual things, like portals.

SMITH: Well, there's many different terminology definitions we can get into, but first let's talk about the different kinds of portals.

NOORY: OK.

SMITH: Because there's portals all over the world and all over this planet, even in the oceans, that have been studied for a long time. There's ancient portals that have been built here by ancient civilizations that have been here long before we were here. And what has happened is, when these classified projects find these energy signatures on the planet, they usually go towards these areas and set up bases near them to monitor how they work, and what's coming in and out of them, if anything, and measuring why are they in these areas of the planet? And a lot of these are on ley lines and on sacred sites that people already know about here on planet Earth. So what they do is they'll find an area, and they'll go to this area, study it for a while, then maybe set up a base nearby. And if they can, they'll try to reverse-engineer this portal technology, either near the same--one of these Earth portals that have been there forever, built by ancient civilizations. Or they will put it right directly on top of the site, and build a base right on top of this, and harvest that energy as well, and keep it for themselves and study it as a laboratory environment.

NOORY: Are there any portals that are natural to the planet, or are they all man-made by some civilization?

SMITH: There are areas of the planet that you don't see a pyramid, or a Stonehenge, or anything like that, but it's just this area has the ability to basically teletransport people and things. And craft will come in and out of these things every so often, and they're not activated all the time. The planet has to be in a certain rotation and axis, and the astrology behind it, also with the universe all has to be in alignment first,

sometimes for these things to happen. So they try to find these areas and they mark them down, they study them. They usually build an Indian reservation on it, or a base to protect it, or buy the land up and classify it as government land, and things like this.

NOORY: Is it possible you can go into a portal, but you can't come back?

SMITH: Well, that's the problem. We do have man-made portals, and the technology behind that just has not really been perfected so well. And this can happen. It's a very delicate thing you're working with. You know, you're kind of working with a little bit of time distortion--

NOORY: Sure.

SMITH: --or you're working with basically breaking down your atomic structure, and putting it somewhere else pretty quickly, walking through these things. And there is a change that happens to your body which you don't actually feel or realize, it's not like in the movie "Contact," where Jodie Foster sees all these crazy lights and meteors and things. It's kind of instantaneous. The movies really elaborate on it too much. There's not this bright light. It's pretty clear, actually. It looks like you're looking through some plexiglass. It's very blurry like you said, maybe wavy like that. So there's a distortion sometimes, not all the time, that you can actually see, and you're walking through that. So if there was a portal a few inches wide between you and I, you would just seem a little blurry, but you could still see me, and I could still see you. But if I went through that, that's a whole rip in time and space. So I'd be at the exit point of that specific portal.

NOORY: Would you disappear?

SMITH: I would literally disappear right in front of you. You would actually see me bleed into the space around you. You would see a distortion, usually, of some sort as the person or, you know, the device, or the aircraft, or whatever is permeating through this. And it's instantaneous. So it's kind of like it's just dissolving on itself. I hate to bring this up, but kind of like when the planes hit the 9/11 towers. They just dissolved into a flat spot. So it's like that, you're just going through, and then you're gone. So there's not any bright lights, or anything like that. And when you walk through these types of portals, you don't feel too much of anything except maybe a pressure change, usually. I always had some sinus issues with it. I can feel my pressure in my eyes, and ears, and in my sinuses kind of pop.

NOORY: When you walk through, Emery, what's there?

SMITH: One of the ones I can talk about, it's an underground facility in New Mexico, is they had built a frame, like a picture frame, out of the ground. And it's anywhere from 15 to 30 feet wide, sometimes they have many of these. And they're about three

feet wide of this metal, that's wide, that goes all the way up in the air about 10 or 20 feet, and then comes over and goes down. So it's like a square, but there's no bottom frame. Just on the sides you see this really thick--

NOORY: Like a doorway.

SMITH: Right, like a giant doorway. And some of these are underground. Some of these are in hangars, like giant buildings above the ground. And they create this electromagnetic flux field, and then there's this line. And it's a very large building, very large area, usually. And everyone is not in that area, by the way, they have people up higher, three floors up with windows, the control center, and all of the safety people and all that stuff's there. And it's big enough that they can fly, inside these buildings they can fly drones, like the big drones you see as big as cars.

NOORY: Sure.

SMITH: So get a picture of a very large facility that has a quarter-mile stretch inside. And they can fly these drones into the portals, and program them to fly back out. And they can also send small robots in and things like this. So they've been studying this for a very, very long time. And not always are they successful when they send a team through. And just like, you know, it's a big risk. Just like astronauts take the risk to go into space, it's no different. And they're not there very long. They're only they're usually less than 30 minutes, but there is a time gap, when they do come back, for them.

NOORY: How do they go in? And then how do they come back?

SMITH: Yeah, they fly them right into the portals. But they know what their mission is, you know, program life form type beings. So they, it's no different than how we walk through there. These craft and these cybernetic organisms have very special material that they use made of, I believe it's graphene and some other special metals from unearth origin that they have mixed together--

NOORY: The latest.

SMITH: That make it, right, it's the lattice that forms around this. It actually forms a small field of energy around these things to protect them, so the electromagnetic field doesn't fry the circuitry and things like that.

NOORY: If you send a drone in with a camera on it, will you be able to see anything on the other side?

SMITH: Yes, yes.

NOORY: Oh, that's amazing.

SMITH: Yes.

NOORY: Is there time distortion when you enter a portal?

SMITH: Yes, like I said earlier, when you're ripping a hole in space and time to go somewhere instantaneously, we've noticed we might be gone just 15 minutes, we get back, we've been gone 45 minutes.

NOORY: Yeah. Or a week, or a month.

SMITH: Yeah, or a week or a month. So it definitely has something to do with the time continuum. And how that relates, I'm not sure. You know, there's many different types of portals that are out there that go to different places. And they're trying to figure out this highway of portals through the universe, they're trying to map that now. And that has to do with a lot of the ley lines of the universe. There's a lot of ley lines that people don't understand that are not just here on Earth, but they go from planet to planet, and to solar system to solar system. And these are energy highways that extraterrestrials use, and that we use--or are trying to use and learn, to get us amongst the stars. On Earth, people know it ley lines are. This is the sacred geometry of the Earth, where it seems to have a lot of energy significance for ruins, and archaeological sites, and ancient history that involve extraterrestrials and things like this. They also have ways to measure these ley lines around the planet, to see where these energy vortexes are. And they seem to be always cornered on one of these ley line areas. They have a map of that, I think. What I'm saying is, people don't realize there's ley lines of the universe. There's ley lines in our own solar system, kind of like we have on Earth, that I think ETs are using around the whole universe to get around. And we're trying to map that out now by sending drones in and all sorts of different types of devices. I think the big hexagon on Saturn, actually, is a giant one of these portals that the extraterrestrials used to go interdimensionally, actually.

NOORY: Is it instant travel when you go through a portal?

SMITH: It's instantaneous. So as you take that step and finish this step, you're still there, but you're just somewhere else. Because we have sent ropes, and cables, and all sorts of things through that were in both dimensions at the exact same time. We were using that more for equipment, and more for data collecting, and things like that. When we go through with the projects, there's usually six to seven people, and there's these lines about three feet wide, and it's about 100, 150 feet long, that goes through that picture frame. And you have to stay inside that sidewalk that's painted. Because for some reason if you don't hit it center, just right, you could actually lose a limb or die. Because--

NOORY: Really?

SMITH: Because of the energy flux fields that surround this unit, it's very, very strong. And there's also radiation that's associated with that on the sides, but not in that walkway, for some reason. Minute amounts of radiation that can harm you. So as you walk through this, you bleed into this area.

NOORY: Mmm.

SMITH: And all the places that I've went to, when you turn around, there was actually another either ancient portal, like some sort of structure mimicking that this is where we have to go back. It wasn't the exact same structure, but they have been doing this a while, where they're building the exact same structure on the other ends of these portals that only open up at certain specific times.

NOORY: And I assume they close at specific times, too.

SMITH: Correct.

NOORY: Have you gone through portals, and you got lost coming back?

SMITH: No, no. I've been through portals, but I've never had a problem coming back. We were only there for maybe 15 minutes collecting some samples. I've never ventured far at all from the actual gateway of coming in and out the entrance and exit of the portal. There has been teams that have been gone for weeks at a time, that have been doing amazing investigations, but I was not a part of that.

NOORY: Gone for weeks on purpose?

SMITH: Right. But they have many, many times, a team did not come back and they were confirmed killed, very recently. I was notified last January, and they called me actually and asked if I wanted to come back, and I said how's so and so and so and so? And they said well, that's why we need you to come back, we lost that team. And they were doing it since the early 90s. This team has been very successful, and they had a glitch in the system, because it was an AI-based mechanical, electrical reverse-engineered portal technology. And it's not worth, of course, for me right now to take any type of position that there's a 50-50 mortality rate.

NOORY: That's too high.

SMITH: That's way too high. But you know, not for some people that have been so successful at it, they've been doing it for decades, and then this happens. You know, it's a tragedy, like when the space shuttle blew up.

NOORY: So this team of how many goes through a portal, and then what happens? They can't find their way back?

SMITH: No. I think everything went fine. They said they had a glitch with the actual portal technology that we had designed, and as they were coming back, it killed them. And the reason they use people in the military, especially active duty, you might have a son or daughter that is a field medic, or a supply chain runner, you know? But all these people could be deployed secretly in places, and they could die, and they get a note from the military saying they died in the active--

NOORY: Line of duty.

SMITH: --war, in the line of duty, and so forth. So most people don't realize that a lot of these technicians and scientists are active duty, because they're the most expendable, and they don't have to tell anyone anything. They could just say they hit an IED, or--

NOORY: Mmm, exactly.

SMITH: Something happened, an accident, and they don't have to explain. All they could say is, you know, here's your $150,000. Sorry that this happened to your son. And you'll never know that your son was part of a space project, or part of underground facility, or part of a portal group that was working on some of the most amazing things. And that's how they hide it.

NOORY: Do we have a team in place that goes through portals, specifically to look for lost people?

SMITH: No. No, like I said, anything that happens, that's why there's usually a team of six or seven. When they come back, if someone had an accident or something, someone would report on that. They don't leave anyone behind. It's a very close-knit family teamwork, a very adept amount of knowledge, even consciously, scientifically as far as massive amounts of intelligence, high-IQ people that are really in shape, and just really well-rounded human beings that are pioneers in discovery. And it's addictive, too.

NOORY: Emery, I'm fascinated by what you said earlier about these universal ley lines and portals. And I am convinced that extraterrestrial craft, they come through these portals or wormholes to get here.

SMITH: Yeah, they're using these energy highways. But it all depends on the type of extraterrestrial, and how conscious they are, what's their level of scientific technology. Because there are extraterrestrials that have been here a billion years before us that have already conquered inter-dimensional travel, just by their own bodies. And they

have built these craft that they go inside. So as they're traveling, the craft can create an electromagnetic flux field in front of it, and can actually form its own portal. They have mastered a portable portal. The gravitational field goes all the way around the craft. And that's why they can make right hand turns at 90,000 miles an hour, and no one goes flying towards the window, because they're in their own field. By this type of technology, they can open up time and space, go into it, and immediately be somewhere else. And it's possible they could be using these ley lines to do that, as well.

NOORY: Can you use these ley lines or portals to get to specific places throughout the universe? Could we go from Earth to Jupiter, just like that?

SMITH: The only ones that I'm aware of are the ones that only go to certain places that are just a one-way, here and there. They are trying to build the DeLorean, and have it plug it in, I want to go to this spot at this time, you know, in the universe. And then it goes there. These portals open up somehow, but they have not perfected that at all. But there is some way to do it. You know, when we are working on overunity devices, a field of energy would form around us, and we could see things. We could see different time--different types of time zones. So there is a way, I believe, that they're going to conquer very soon of, OK, we want to go back in this amount of time to this area on Jupiter, and they'll be able to do that.

NOORY: Are there monuments or structures on this planet that are built near ley lines and portals for specific reasons?

SMITH: Yeah, I do believe that all these ancient ruins and these portals around the planet were actually there to heal the earth. I think it's an energetic component of the Earth that the extraterrestrials built, or helped us build, to protect the earth, actually, in different times of chaos that's going on within the Earth. Which is, just like our own bodies are trying to achieve homeostasis, the earth is constantly trying to achieve its homeostasis. And I think all these ancient sites, these sacred sites, have something to do with keeping that in balance.

NOORY: Is the military involved in any of this, Emery? I mean, are they tapping into this kind of technology?

SMITH: The military are usually just assigned to secure these areas, and provide mostly security. But they have used security details to come with the team for safety, and things like that. They do always need a paramedic, they always need a security guy, and the rest are usually scientists. And a lot of these people, they're all trained in weapons and first aid, and it's just--that's what you are. When you're part of a mission, you're going into space, and they're going to pick people that's going to go to Mars, each person--it's not just going to be one person only knows how to fix an engine, I'll

tell you that much. Everyone on that team is going to be so well-versed in so many amazing things. Because that's what they're looking for. They're looking for these scientists out there that are hard-core adventurous, that have not just one background, but study everything. Because you need that in a team to survive extra-planetary visits, or space travel.

NOORY: What could a nation do that understands the use of portals, in order to manipulate the rest of this planet?

SMITH: Well, I think what's going on is there's only a few of these places around the planet that's pretty much owned by the major corporations. They're so scared of this technology, since it's not mastered, that right now what they're doing is just using these portals to go into these areas, bring back specimens of plant life and minerals, and use that to make products here, and to further advance our technology, and of course, further advance their pocketbooks.

NOORY: So you literally can go through a portal to another physical location, and take things, if that location happens to be in the right spot?

SMITH: Correct. You can go in and bring things back. Whatever the mission is, like one of the things we were doing is collecting plants. And I think I spoke about this before, I won't get into it, but one of the plant leaves was bulletproof. So they were trying to find the exoskeleton of this plant to say, well, how can we replicate this into our suits? Our special suits and things like this. So a lot of the technology we have today actually came not only from reverse-engineered extraterrestrial downed craft and extraterrestrials, but came from these missions that they were doing in portals.

NOORY: Do these portals go to other universes, or other areas within our universe?

SMITH: Well, they can go anywhere. The ones that I am directly involved with only went to one specific location within this universe. And I don't know exactly where that is. I just know that I could breathe the air, it was kind of the same temperature, there was nothing different except the way the dirt looked, the way the plant life looked. Some of the small marsupials and small insects, I've never actually saw a being. But I have seen videos of past-portal--everyone has cameras on them, by the way. I have seen videos of people meeting beings on different planets. And actually, they were there waiting when teams went through 15, 20 years ago. So there is definitely something they're using it for, but I was not at a classification security to know or ask about it, because you have to go through certain training. It's just like before--active duty members, when they get deployed somewhere, we have a good day or two to learn the customs of what country we're going to, or what we could involve--it's the same thing. We get to know this is what you're looking for, the type of rocks, types of plants. This is how we're going to collect them. These are the

species that are there, so don't be alarmed. You know, we were able to see a lot of different missions, way before we go there, that have already been done in the same spot.

NOORY: Emery, how were portals discovered in the first place, and what were they looking for?

SMITH: Well, the best way I can--my own opinion on that, just from all the stuff I've read and been exposed to, is that they first had these special types of satellites that picked up on subtle fluctuations of energy in many different types of fields of energy. And they notice hot spots around the planet, and they would go and investigate these hot spots. Send teams, maybe send even military craft and ships out there, and see what was going on, and figure out why these areas have these huge electromagnetic flux fields, and all these vortexes of energy. And they were, like I said, using types of technology I'm not familiar with. So they were there locating them, and then going to investigate, and that's how they were finding some of these ones that they didn't already know about, such as the pyramids and Stonehenge.

NOORY: Were they in shock when they found these spots?

SMITH: I think it was like a learning thing. It's always a new discovery. It's happening every day, we discover new things on the planet, and the secret projects. And it is a mind-blowing thing, I think, for the scientists and for the corporations to figure something out, and to find out what's going on. Because we really don't know that much, because we're using our five senses here on planet Earth, and there's a lot more than the five senses going on around the planet, and around the universe.

NOORY: What's the difference between natural portals, and portals that are made by man, or an extraterrestrial race?

SMITH: Natural portals use the energy of the planet, and all the planets, and these ley lines universally that I was talking about. When they make an artificial, reverse-engineered portal, they're powering it with their own power supply. Sometimes they would like to build it near the ley lines and somehow tap into that, or build on top of a natural made portal, you know? So they're trying to mimic these energy flux fields at a certain rate, to create the exact same thing. So one is man-made, and one is completely natural.

NOORY: Is it easy to make them with today's technology?

SMITH: Absolutely not. It's very difficult.

NOORY: That's what I thought.

SMITH: We're a bunch of, we're not at that level of intelligence yet.

NOORY: What's the difference between a stargate and a portal?

SMITH: Well, stargates are more like pop culture terms that you see for the movies and TV shows. That's just another term for a portal, or an inter-dimensional highway, or a trans-dimensional ancient ruin that can get you somewhere. It's just another term for that, so we don't use that term.

NOORY: Basically all one in the same, aren't they?

SMITH: Right.

NOORY: Are we using portals right now?

SMITH: The last I've heard and been debriefed on is they're still using portals to collect data of different areas of the planet and other planets, and also bringing back samples to reverse engineer different types of metal, and plant life, and genetic DNA. They're bringing back all sorts of things.

NOORY: Is there a nefarious reason for this, too?

SMITH: Not that I'm aware of. Like I said, this is more used for reverse engineering, creating better products to sell, creating better pharmaceuticals. With that, I would always assume that there could be a negative aspect of that. If you're making something good, you're also gonna be making something bad, or something to protect something that shouldn't be protected. So I'm sure there's--it goes both ways. A good and bad balance of many different types of technologies come out of this.

NOORY: Who's mapping the portals, and how do they do it?

SMITH: Well, there's a number of institutions and organizations out there, and corporations that are in control of these portals from around the planet. And what they're doing is using drones and other things to look at the stars, at these different other areas, and mapping where it's coming from. So they could, let's say go through a portal, be on another planet, look up at the sky, see the different star systems, locate our star systems, and then draw a line from there to there. So it's kind of archaic, but this is kind of, from what I understand, is how they're doing it.

NOORY: Are there portal mapmakers?

SMITH: Well, no, I think it's just part of that project. It's always, no matter if you're going somewhere, you're still going to be always mapping, taking readings, and things like that.

NOORY: Emery, there's got to be other portals on this planet that have been used by, I would believe, extraterrestrial races, or other civilizations for their own purposes. Aren't there?

SMITH: Oh, sure. I mean, a lot of these energy fluctuations that they've marked on the satellites, and when they go to investigate, they kind of just sit back a mile or two, or even closer, and visualize, even in a 3D, these craft coming through, and measuring all sorts of different types of energies. And yes, so absolutely. There's definitely craft coming through that they're monitoring, and seeing what's happening, and trying to track those craft, of course. But they're not shooting them down or anything. As far as I know, there hasn't been any type of attack or something from one of these craft. You probably wouldn't be able to, I don't think, even destroy one of these craft, because they've already conquered inter-dimensional travel. They could just be fluxing in and out of this frequency when they come through the portal, and if you shoot a torpedo at it, it would just go right through it.

NOORY: Are there some creatures on, let's say, Zeta Reticuli, that look at a portal and they say, that's the path to earth. Let's do this one.

SMITH: Well, I believe in other underground facilities and extraterrestrial bases located within earth, that they're using that type of technology to come in and out, for sure. They definitely wouldn't be using a spacecraft.

NOORY: Spiritually speaking, are those portals that we've heard about during the ancient times the same as what we're talking about today?

SMITH: Yeah, I think looking back at all the ancient text and things, there's a lot of correlation to the stories behind portal technologies and things like that, where people would just appear, or craft would just appear out of nowhere. And they were probably witnessing this type of technology back then.

NOORY: Emery, how did the ancients come across portals? I mean, they didn't create any, they didn't have the technology to do it. Who did?

SMITH: Well, when I say ancients, I do mean ancient extraterrestrial civilizations--

NOORY: Aha.

SMITH: --that helped humans at one point, too. But even before, way before that, even some of their craft had been crashed and dislodged in the ice, and dislodged in caverns, and even within the Earth itself. And they have these, like I said, portable portals already still running on the craft for thousands of years, even to this day.

NOORY: So they've been using that for that long, at least.

SMITH: Right, correct.

NOORY: If you were asked today to go through a portal on some mission, would you go?

SMITH: Probably not, because I'm still--it'd be a good way to get rid of me right now. And I've been turning down so many contract jobs because of this.

NOORY: You think they would do this to get rid of you?

SMITH: Well, accidents happen. And right now, I need to be here on Earth. I need to be helping people understand what's going on, sharing the knowledge with people like you to get it out there. Because me leaving the planet right now is not going to help the planet, and I gotta help the planet, and I gotta help everyone here first.

NOORY: I've never seen you scared before. I'm picking up a feeling of somebody is out to get you.

SMITH: That's always in the background. I mean, that's always going to happen when you come forward. There's--the threats have gone down considerably since I've came forward. I'm not talking about the sensitive subjects anymore--overunity and regenerative medicine so much. And that's really where the threats come from. The government does not care that I talk about ETs, because there's no money being made in ETs. But when I start teaching people the physics of overunity, or talking about cellular biology that can help heal you so you don't need pharmaceuticals, then I'm stepping on the toes. So you gotta be careful with these things. And I had a whole life of threats, ever since CSETI, since I got involved with CSETI and then after that, with the overunity lab that I had, and then of course recently, the last two years, it's been pretty horrible. But life is getting a lot better for me now. I have great organizations and corporations contacting me that want to do the right thing, are not interested in the money, or the control over the people. So I think the world, and all the listeners are having a really good impact on the planet by talking about this more freely and open, and finding out about the cures that are out there that I talk about, and researching these things. Yeah of course, I would like to take the next ship out of here. I want to go back amongst the stars. I want to go back to my roots, and be the explorer of these places, but I don't think it's right to abandon--I really, really love this planet, and it deserves a chance. And I'm going to do my best to get these technologies out to help clean up the planet. And with the help of all my listeners, and people backing me up and standing behind me, I think this is going to be done in a very short period of time. Because people are going to start listening more, and other countries are wanting to get involved with this. So bringing everyone together, and putting all the other ego stuff to the side of religion, and war, and racism, and all this, I think that's going to be a big catalyst for us to go in the right direction to help the planet. And then we can

help each other. And once I know that everyone is in a homeostasis kind of state, including the earth, well yeah, I'll probably take a trip to that portal again.

NOORY: Stay out of portals right now, though.

SMITH: But right now.

NOORY: Thanks, Emery, for being on the program. This is "Cosmic Disclosure," thank you for watching.

The Perils of Portal Missions Season 12, Episode 21

Cosmic Disclosure; The Perils of Portal Missions Season 12, Episode 21

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith. Portal missions--what's it like to enter into another dimension? Emery, welcome back. This is going to be fascinating.

EMERY SMITH: Thanks for having me, George.

NOORY: These portals--what do you have to do to gear up to go into one?

SMITH: Yes, I mean, there's a lot behind that. I mean, not only just getting in shape for this because you might be going somewhere where the air is a little thinner. And if you haven't been training at high altitude, you're going to have a hard time trekking and a half mile out and a half mile in. So there is a lot of physical fitness training you do have to go through based on the mission. The mission also by the way, it's not like they call you up and say, oh, you're going away tomorrow. No, this is something that's planned out for months, and months, and months, and months in advance. So you get to meet your team. You get to establish a rapport, establish personality profiles with each other to get that camaraderie to work together for the mission. So what we do is the first thing that would happen is there will be a mission plan, let's say, three to six months out. And they would get a group together. And it depends what the mission is for. Do they need a botanist? Do they need, you know--what kind of--

NOORY: Right, a medical doctor or something.

SMITH: Right. What is the mission? What kind of engineers you need for this mission? What type of a geologist do you need for this mission? And so it's a very specific thing. And there's usually around six to seven people in a team. There's always a medic that can do three or four different things. There's usually a security person that also can do three or four different things. And then you have the main scientists that are there for specifics for whatever that mission. So we'll go through three months of number one, just education of the background of where we're going. So we get to see the debriefings of the past 150 missions.

NOORY: Seems pretty intensive.

SMITH: It's very intensive. And it's a lot of information all at once because there's some things you can touch. There's some things you can't touch, which they found out the hard way. So there's these rules, and regulations, and protocols specifically that

you have to follow when going through any mission-oriented portal traveling because if you don't, things can go bad really quick, such as the weather, such as someone getting injured. Even something like that will slow up the mission 67 tremendously. And when you only have anywhere from 15 minutes to a few hours max to do your mission, you really have to optimize that time. So it is this kind of running in and running out type of thing for safety reasons because like I said, they haven't really conquered how long that door stays open.

NOORY: Do they know where they're going once they enter the portal?

SMITH: Yeah, in the briefings, we have lots of video, lots of pictures of prior teams going in and out. So we have an excellent idea of what we're going to expect. It's like reading the map of London before you go to England to visit. And you kind of know what's going to be there. There are however, occasions that sometimes this asymmetrically doesn't work out so well. And there was one time where we actually went to a place and it was the wrong place.

NOORY: The wrong place?

SMITH: It was the completely wrong place. We were supposed to arrive in a desert. We arrived in a tropical jungle bog. And it was a very we weren't prepared. The suits were not prepared correctly that we had to use. The equipment was wrong. And luckily, we were able to turn around and get out of there before the last man came through, which it was just a different area. And this area, we'll have to go back because maybe this was an area that was never explored because we've never seen it before.

NOORY: What else could go wrong that you wouldn't anticipate?

SMITH: Some of the scariest things are the geological events on a planet that you're not familiar with. We sometimes bring these special dogs that are trained for frequency. And they can hear and tell you before an earthquake happens or a volcano erupts. And they have special senses that they've been trained on. They also can smell certain things. They've been trained as a puppy to learn different scents of minerals, different scents of plant life, different scents of different types of genetics that can smell many, many different things and sense and hear frequencies that we can't hear. There was an incident where we were walking and there was an underground bubble just a few feet below the ground. And someone was just walking and stepped on it. And it released this noxious, very poisonous gas right through the surface and you could see it.

NOORY: Without the dog, you could have gotten killed.

SMITH: Right, we could have gotten killed. So they can pick up on the slightest little

things. And so it's a protective measure.

NOORY: Do the dogs that you take--are they wearing special outfits too?

SMITH: Yes, they are. they have--it depends on where we're going and what type of environments there. Sometimes they just go as themselves with a little backpack and all their equipment.

NOORY: A little leash and off you go.

SMITH: Right. And sometimes, they're not. Sometimes, they have special helmets for these dogs. They always have eye protection all the time. They wear these giant goggles--these special iridium goggles like you see on the astronauts helmets--when they go to these things. Some of these can be waterproof. They actually have special designed suits for these dogs where they actually have their own helmet system and they have ways to read the atmosphere for testing. So it just depends on the type of mission and where they're going.

NOORY: Is there a specific breed that is better than another, like German Shepherds or something like that?

SMITH: No, no. Some of the breeds that we use mostly are Mastiffs because--

NOORY: Those are big dog.

SMITH: --they're big and burly and they can carry a lot of weight. And you have to understand when you put a dog in a suit and a lot of weight, you do need some strong animal to do that plus their sense of smell is really good. And that being said, going back to the threats, one of the scariest things for me are like earthquakes, which I've been involved with hardly ever on planet Earth. But through these events like it just happens.

NOORY: Sure.

SMITH: Also storms can brew up out of nowhere. So we have a lot of cool equipment. We have specialists that monitor the weather. Sometimes, we have also types of robots that are with us that collect this data and using special equipment to monitor the area--just the atmosphere, the ground, special sensors are in the ground.

NOORY: In case something changes.

SMITH: Right. And you have the dog too. And then you have the team that are just trying to get their jobs done. We're just trying to get in and get out safely. That's our job and very mission oriented. We have special suits depending on where we're going,

depending on the pressure, and how hospitable the areas that we're going to be going to. Sometimes, we have our own pressurized suits. They're kind of like a thin astronaut suit, but you couldn't survive on a spacewalk for sure.

NOORY: What about helmets?

SMITH: Yeah, we have helmets that we use today for salvaging space wreckage. It's a very hexagonal helmet that comes onto your suit. And you're in constant contact. Everyone's always in constant contact until you see something that's really amazing. Like one, time the sky at one of these places where it's constantly changing colors. It bleeds from light blue to violet to pink to yellow to red. It's like this weird cosmic colors--like the whole sky does this. So we thought it was just because of where we were that our eyes couldn't really see. We thought it was a problem with the human body was not able to. But they linked it to some sort of atmospheric gas that was surrounding the planet, kind of the Aurora Borealis. The whole sky was like this. So it kind of made us sick as we were hiking down this trail, I remember. And the constant changing of the colors were making us like nauseated. So they had to use a special film that they made special helmets just for this planet that allows the sky to look the same color all the time.

NOORY: So you're saying the changing colors had some impact on how you felt?

SMITH: Yes, it did. Yeah, it had a nauseating type of feeling that everyone experienced, even the dog.

NOORY: Now, you had mentioned the members of the team--some were medical, some were security, a lot of scientists. Who picks the team?

SMITH: Well, there's these team managers that are put in place in these things that have been running it for a very long time. Some are very new. Some are very old. So they go in and say, this is what we need to do for this specific mission. We need to get this type of crystal. We need to get this type of plant, get some samples of this type of water. I was fortunate enough to do a dozen of these because they always need a field medic. They always need someone with the experience I had with the biology of plants, and animals, and extraterrestrials, and things of other than Earth origin. So I was harvesting plant material, and crystals, and dirt, and water, and things like that. And at the same time, I was also security and also a field medic.

NOORY: How many missions were you on?

SMITH: A dozen--about a dozen.

NOORY: Of all the missions that you have, is there one that really stands out and can you tell us what it was like?

SMITH: One of the missions that we went on was this planet I was telling you about. It looked like a desert and it had this color changing sky. And I'll have to get back to that because it was probably one of the most amazing places I had been because the lakes that were there. And some of the trees and things were all this bioluminescent, iridescent colors. They weren't putting off light, but the light from the atmosphere was reflecting off of them. So it was like a chrome world where plants and very large trees--like you could not see the tops of these trees. Kind of like redwoods, but more like redwoods that looked like Christmas trees. So really big in that triangular formation type things. And kind of like pine needles too.

NOORY: Like a mirage almost.

SMITH: Right, it's like a mirage, but not blurry. Everything's crystal clear. But I think it was because of all this reflection and the lights from the atmosphere I think were making everyone nauseated when you were trying to do your job. So I was lucky enough to go back there one other time and with these helmets. And they were allowing us to easily just see in one color spectrum. And it wasn't affecting us and you could see really clear. The water was the most amazing thing because it looked like the liquid in a light sticks. Did you ever see those lights--

NOORY: Yes.

SMITH: --and like the kids would use on Halloween?

NOORY: Yeah.

SMITH: And then so the whole lake was like this bioluminescent moving. And it was just a lake and it constantly had small waves. And we didn't understand how could this small lake--maybe 20 acres or so--have waves in it--like two feet waves.

NOORY: Because it's self-contained, right?

SMITH: Yeah, it's self-contained. And this is also one of the first places I experienced the earthquake, which is very unsettling. When you're doing something as a team, sometimes someone else has to go maybe 300 yards away from you. So we're kind of spread out a little bit. And we don't stay together like scuba divers. We go out and do our thing. We all have maps already of what we're supposed to do. We have special GPSes that we could see on our heads-up display. We know where everyone's at. We can immediately find out if you're with me, 302 I was like, what's George's heart rate. Is he OK? Plus the robot that's with us is always monitoring everything. So if something did happen where someone even--you know, they have gyros in these suits, so they know if we fall. So that they will know immediately if we fall, it will set off an alarm. And that's also scary because we had someone fall off a small cliff because the ground looked like it was solid, but it wasn't. And this is another thing with the

geologists that are there. And they take these seismic imprints from these robotic units that will shoot like a wave a frequency or a sonic wave into that and it builds. So we want to know where we're at--is that ground even supported? Because you could just be walking along and poof, he's gone. So before we do that, we get there. The robot runs all the tests on the atmosphere, on the ground, and everything. We have these perfect volumetric images of everything, so we know, all right, this is safe up until this area. But these things happen. And then as soon as someone gets injured, now the mission is aborted. This becomes a life-saving mission.

NOORY: One person gets hurt, you call a come back?

SMITH: You cancel the mission and you bring the person back.

NOORY: Let's say you've done your mission. When do they send you out again?

SMITH: It depends. Like I said, you might be training for two, three missions at one time. So you might be in that three or six months preparing to do maybe a mission every other month. It just depends on what they called you to do, what missions they want you to be on. I've never really done a mission in more than one per like month. I've never done--

NOORY: That's still a lot.

SMITH: --two in the same month, but I was only part of that program for a short period of time.

NOORY: Where do you train, on this planet?

SMITH: You train in the facility, wherever that facility is. This facility was in northern New Mexico in its own section I'll say, not associated with the bases.

NOORY: Underground?

SMITH: Underground, mmm. And they have an area there that is like a classroom--very basic. And you get to talk to sometimes people that have already been there. So every day, it's kind of like a little school. You have about two to three hours of education. And then you have, of course, your physical fitness is about three hours a day. And then you also get trained in how to work the robots, and the different types of computers, and different types of devices you're going to be using. You go through scenarios where we will actually dress up and just walk outside in the desert, and just like use our equipment, get very comfortable with it. We'll do fake things--a lot of fake little missions before we go to make sure everyone is comfortable. And then we do a course.

NOORY: And then you go.

SMITH: And then we go. And then a lot of times too, we also just like when pilots are doing pilot training and they run these simulators. They do the same thing with us. They say, well, what happens when so-and-so falls off a cliff? What's the protocol? Bam, bam, how are we going to do that? What happens if someone brings back a bad biological agent? What do we do then?

NOORY: Has that happened?

SMITH: Yes, that has happened, where we got quarantined for two weeks--all of us.

NOORY: Jeez.

SMITH: And luckily, none of us got--it was on the suits.

NOORY: Well, what if this organism got loose throughout the planet here?

SMITH: Well, this facility is a vacuum air-sealed-tight room where these portals come through. And what they do is they have special devices kind of like a Rife machine, but a lot larger that can scan like a whole football field. And it knows if there's a foreign microorganism on you, like a virus--a negative ionic--some sort of negative cellular material. It knows how to pick this up. And immediately as you come through that, you've got to stop.

NOORY: Alarms go off and everything else.

SMITH: Alarms go off and they have to sanitize the whole room. They use ethylene oxide gas. They use a frequency devices. And you just get blasted. OK, and then from there, you have to go through a separate part of the building that's an airlock and sit in there like an HBO chamber. And then they have to monitor you for like eight hours. And you're just sitting in there. And you can't use the restroom. You can't do anything. And then at the same time after that gets cleared, then you go through a regular what would be called decontamination, where they just go you walk through this hallway and it sprays you with water and all different types of chemicals. And then you're free to change out. And then you have to go through a two-week evaluation where you're put in confinement with the team. And they have special underground apartment complexes for this reason that's completely airtight sealed. And then you just kind of live there.

NOORY: Do you have friends that you have gone on missions with that you still collaborate with?

SMITH: All my friends and colleagues have all passed away in January from that

accident.

NOORY: All of them?

SMITH: All of them.

NOORY: You're the only one left.

SMITH: Correct.

NOORY: How do you feel about that?

SMITH: Hurt.

NOORY: Good people?

SMITH: They were my friends.

NOORY: Is this program worth it, Emery?

SMITH: Anything to advance our technology I think is positive, even if they use some of the technology for the negative. There's always good things that come out of it. And we do need to broaden our horizons. We can't be quarantined to this planet forever, regardless of what's going to happen in the future--if we get along or not. We need to be educated. The world needs to be educated and informed about all these amazing things that are happening out there behind our backs and utilize that for the good of the planet and the people. And I have a lot of hope that a lot of this is going to come forward with other people. And I'm trying to get, of course, people that were associated with that program to come out and maybe do something, but that's a long shot. It's more of getting people that scientifically have the background that been involved with those projects.

NOORY: Would you do it again given the chance?

SMITH: Sure. Oh, absolutely. Yeah.

NOORY: These missions that you've been on, have you stumbled across extraterrestrials or had some planned contact with them?

SMITH: None of my missions I was face to face with an extraterrestrial. We have seen videos from past missions of other people meeting extraterrestrials through portals, some even having set up meetings through these. But I have never seen anything face to face during my adventures through that.

NOORY: Why are the missions so short--15 minutes, 1/2 hour? Why aren't they

longer?

SMITH: Because they haven't really--the longest mission I've ever been on is two hours, but it usually only lasts about 15 minutes to 30 minutes because it's like a safe zone for that portal to be open. It's only open for a certain amount of time to the certain area at certain--like I said, the planet has to be just right. Even if it's the man-made one, there's still a lot of things that are in place they haven't figured out. So to play it safe, even though it's open for 12 hours, we just do one in, one out and play it safe and keep that mortality going.

NOORY: So they're not quite sure what could happen, so they call things quick?

SMITH: Yes.

NOORY: The portals that you use for your missions--what are they? Are they man-made or are they already part of the planet?

SMITH: Well, they have built the one I was going through on top of one that's already there. So they're utilizing not only man-made energy, but they're also using the energy from the planet.

NOORY: Does every portal go to a different place?

SMITH: Yes, I mean, as far as that I know that all the portals are going to different places. And there are some portals, of course, that the ETs have that they're utilizing that can go multiple places using that ley lines of the universe.

NOORY: Can we though direct a portal to go to a specific place? Do we have that kind of technology?

SMITH: No, not yet. Basically, what we do is we wait for a certain time where we know that this is where this portal is going. And when that happens--and this is how they've been sending drones through--

NOORY: You jump on it.

SMITH: --and then we jump on that. We jump on that wormhole that's open for 12 hours.

NOORY: The portal you go through is the same portal you come back in, isn't it?

SMITH: Yeah, it's the same portal. Sometimes since it's been going on for so long, they have actually built a similar man-made portal on the other side utilizing the ancient portal that was already there. So that frame I was telling you about sometimes

is located in that same area.

NOORY: We're concerned about contamination and viruses, but what about psychological things too? Anything happen to people?

SMITH: Not so much. I mean, these people know what they're getting into. They go through huge psychological evaluations. I've had more incidents being in the military in hot zones where people were freaking out a little bit more than the usual. It is a different type of environment because you know you're going there. You kind of almost volunteered to go on these missions. You have accepted that responsibility. You know it could get very scary very quickly. You know that you might not come back. So these people, as far as I'm concerned, are heroes. They're the real superheroes of the planet. And they're doing something because they believe in it and they believe what they're doing is not harmful to anyone. And even though it may be--you know, we are just a group of soldiers going in to complete a mission. And that's what we do.

NOORY: So you collect all this data. What do you do with it afterwards?

SMITH: Well, I think they're just making a database, like we do with ETs and extraterrestrial craft, and logging in. They know where we're at. They know if we're on Mars or in another solar system. And I think they're just looking at different habitable places to maybe rebuild the civilization here on Earth in other places that are safe. I think all that data is being put into some big secure database for evaluation.

NOORY: What's the protocol for taking samples?

SMITH: Well, it depends what kind of sample it is. Vacuum containers--they look like a sunglass holder. And we have bigger ones too that could be as large as about three feet in diameter, like an egg shape. And these things are vacuum pressured. And sometimes, special gas can be introduced into the unit. And some also can freeze things, like instantaneously.

NOORY: So different tubes for different specimens.

SMITH: Different tubes for different specimens. There's only like two or three different tubes, but they all kind of do the same thing. Once you put something in, you can take the air out that was from this atmosphere and fill it full of a special gas or you can basically add--it has a nitrogen-like thing on it. 578 It can freeze it instantaneously and remove the gas because anything that comes back that was open there, you have to be careful. And the robots know how many parts per million of particulate matter are floating around the atmosphere. Because even in this room right now, you have trillions of particles just here, but you can't see it. And we have to know are those particulate matter--is that going to create something back home? Is

that going to be a threat--

NOORY: Contamination.

SMITH: --a contamination. So as soon as that comes through, all of those containers are put into a another giant container and is shipped off somewhere.

NOORY: Safety purposes.

SMITH: Right. And then is shipped off somewhere, right.

NOORY: By going through these portals personally, what have you gained from it? What has it done for you?

SMITH: Well, it inspires me. It gives me even more hope that there's more stuff out there that can help the Earth and help mankind. I have a great compassion for all these different places. And some places I don't think we should be because they're so beautiful. I don't want us to contaminate them.

NOORY: Is it exciting to go through these?

SMITH: It's always exciting. I mean, there's always something that happens that never happened before. And it always gets down and written in the books that this has never happened. And to be part of that was really exciting.

NOORY: What is this technology done for the planet--the fact that we can do this?

SMITH: It's advancement in science. I mean, everything we bring back, like I said, has to do with something that they're going to create to help our longevity, to help the protection of us. I would like to see a shift in that, so they start utilizing it to clean up the planet because I'm more about let's get the planet fixed first before we live for another 200 years. That's great--love it. But without the planet being fixed up--because they could be turning this technology around that we get from these other planets and utilize it to clean up Earth. Special dirt that absorbs radiation and things like that that they have brought back--and this can be manufactured is what I'm getting at. Imagine dumping that into an area of the ocean that can clean out a 500-hectare area of radiation in the water. So there's these amazing technologies that are coming through that are kind of being utilized in the wrong way, that at the same time can be engineered if they've got the right people on board or get the technologies into the right people's hands to utilize it to help the Earth.

NOORY: Emery, great information. Thank you.

SMITH: You're welcome, George.

NOORY: This is "Cosmic Disclosure." Thanks for watching.

The Long Journey Home Season 12, Episode 22

Cosmic Disclosure; The Long Journey Home Season 12, Episode 22

JAY WEIDNER: Hi, everybody. I'm Jay Weidner, and today we're continuing our conversation with Jason Rice. Hey, Jason.

JASON RICE: Hello, Jay. Thank you for having me again.

JAY: So let's just recap a little bit here. You were wounded gravely on Planet Three. And you went to Mars, where you rehabbed, and then you went back to Planet Two to work in kind of the recovery program.

RICE: That's right.

JAY: You got to actually see the results of, I guess we could say the Cabal's plan, for this planet.

RICE: That's right.

JAY: And it was basically to move them from a rural agrarian kind of society to a more high tech. And to do it quickly, they had to basically manipulate the situation through false flags.

RICE: That's correct.

JAY: So here we are. You're on this planet. What happens now?

RICE: Well, we're there to help them rebuild and to help keep the peace. A lot of our mission posture was related to policing actions, because the scope and the breadth of the war pretty much affected every corner of the planet. So a lot of the social services or the governmental services where they were, were broken down. And the entire population that was left--again, about a third of the 4 billion that started out--where what were remaining, they were reliant entirely on the government structure for their well-being, for their supplies, for their food, for their housing, taking care of their families. So part of our mission structure required us to take on policing actions, or civil service. So we had to finish out and help them get that established. And part of the plan was by the Cabal to get them to a technology based civilization as quickly as possible, because part of the AI plan was to speed up the technology progression.

JAY: And this was the MO pretty much, I would say that this group that you were operating with, were doing everywhere. And even beyond what you experienced.

RICE: Even beyond what I experienced.

JAY: How long did you serve in this duty?

RICE: I was on the rebuilding efforts for Callidus 3 for another couple of years.

JAY: And then you finally--that was the end of your service?

RICE: And that was the end of my deployment.

JAY: What do they do, come up to you and say, hey thanks. You've been helpful, but we're sending you back?

RICE: Well, they weren't finished with me yet. They decided that the experience and knowledge that I had gained through my deployments on a number of planets was invaluable to the continued efforts, and they needed me in the training regiments. And so that was where I spent my next appointment. I was returned back to the Sol System, and spent the remaining years of my service in the SSP working as a trainer.

JAY: For tactics and weapons?

RICE: Tactics, weapons. New people coming in, they're going through the exact same thing that I had gone through.

JAY: A lot of people going through these things?

RICE: There were about 5,000 a year. Just about any and every country.

JAY: Are they volunteers, these people, or were they taken against their will, or what?

RICE: They were all volunteers. All of the ones that I helped in the training were all volunteers. They were all service or military related in some way, be it the Navy or the Marines or the Air Force or the Army, from a wide range of countries.

JAY: And how long did you do this?

RICE: I did this for almost five years.

JAY: That's quite an adventure.

RICE: It was.

JAY: It probably was a relief to be doing that work after being in the battles and wars.

RICE: It was a double edged sword. It was rewarding, as well as incredibly

concerning. Because that was around the time that I started piecing together a lot of the puzzle pieces and getting a full picture, a better picture, of what was really going on.

JAY: One of the things that we didn't cover in your narrative was the time that you spent in the South Pacific, right? And it's important to at least touch on this, so let's do. So what happened? How did you get to the South Pacific early on in your career there?

RICE: Sure. The training that we went through in the FIG--the Fort Indiantown Gap--underground base wrapped up with two missions. The first was to Antarctica. In which we had to individually use our intuitive empath abilities to navigate back to base. And then the second was similar, except that it wasn't in Antarctica. It was in the South Pacific. Now, the Arne and Nicobar islands off the coast of India have these large rock structures there off the coast in which you have these essentially cylinders of islands that are topped with grass and green and have some foliage. But they're amazingly beautiful structures. And there's an area--I still have not located it, but there's an area in the South Pacific where we were dropped off on the top of one of these. Again, this was an individual exercise in which we were reliant upon our intuitive empath abilities to navigate our way back to our base. The purpose being is that they wanted us, number one, to have full confidence in those abilities. And you know, they build us up to a point where they have to test it. And so that's one of the ways they've found to be the best way to do it is to set a person loose.

JAY: And so again, was it trying to find your way back navigating through, what the jungle, or what?

RICE: This was a little different. Part of the anti-gravity tactics that they taught us and that we trained on involved the use of what, for the lack of a better way of putting it, were these transformable gliders. And so they're individual gliders. We had individual anti-gravity packs. They were limited by their batteries, so you didn't have to use a full pulse drive. You could use it as intermittent to get you where you needed to go. And then using the natural aerodynamics of a glider--

JAY: Hang glider?

RICE: Hang glider, yeah.

JAY: So you use g-forces to lift, and then you use the aerodynamics to fly around.

RICE: Well, they dropped us off on the top of these pillars. And some of them were hundreds of feet up above the water. And so we had a natural jump off point to get airborne, and so we didn't have to use the anti-gravity pulse of our backpacks to get us airborne. And so once you got airborne, then you would try and find neo-thermals to

keep and stay aloft so that you could preserve the backpack as long as possible.

JAY: And that was the training, was to try to stay aloft?

RICE: Stay aloft and to direct and find that we're about 500 miles away. The base--is it this direction or that direction? You have no idea, no clue. So you have to use your intuitive empathic abilities to say, OK, I think it's this direction. That feels right, and that's the way that I'm going. And so you had to navigate your way there using the tools that they gave you, the limited ones. The gliders transformed, had floats on them, so that if you did go down in the water, mechanically you could reconfigure it into what became a small sail craft. Because you know, the wings were fabric and so they're easily converted into a sailing craft.

JAY: Did you get back? Apparently, you did.

RICE: I made it back. It took me about 12 days to do it. And the nanite enhancements allowed you to preserve and conserve your energy, as well as requiring that you didn't have to eat as often. We carried water with us, and so we weren't devoid of water. And that was rationed out individually so that you survived the trip. Part of what I had also provided, because I'm an engineer with the conventional training as an engineer, is that at one point in time, I was called to a Russian base to help them with what was an advanced propulsion system on a ground vehicle that they had captured from somewhere. I had never seen it before.

JAY: Oh, really? And this was a Russian base in space or here on Earth?

RICE: This was a Russian base here on Earth.

JAY: Tell me about the base in Russia that you went to.

RICE: The Russian base that I went to was in the tropical area on the planet somewhere. I don't believe that it was in Russia, the mainland of Russia per se. But it was somewhere within the tropical areas, based on the weather and the temperature and humidity.

JAY: This was during your time that you were training people?

RICE: This was the time that I was training people.

JAY: Engineering skills?

RICE: I used my engineering skills.

JAY: And what was this thing you were looking at?

RICE: It was a ground vehicle. It had wheels, except the power plant was something I'd never seen before or experienced. And so they wanted my help and assistance in evaluating what it was and how it operated. Part, I'd say about a third of the vehicle, had been destroyed through--they wouldn't tell me what it was. I didn't ask. But part of it was missing. The parts that we did have were enough to do some reverse engineering and some work on.

JAY: And why did they think you were going to be able to help?

RICE: Because of my engineering background, and the experience that I'd had on multiple planets.

JAY: Right. And like me, you may have seen one of these vehicles in--

RICE: Correct. Correct.

JAY: Did they ever discern what this vehicle was or where it came from?

RICE: I suspect that it was probably from one of the other division's exploits from a different planet that I had not been to.

JAY: Is the Russian SSP associated with the Cabal SSP, or are they all the same?

RICE: All of the countries on the planet contribute soldiers to this Mars German program. Because any country that wants to participate or be able to use the LOC has to contribute soldiers to the effort. That's the price.

JAY: So then any other adventures between that and the time that you had to go back?

RICE: There was another time where I was off planet at a conference. I was traveling there on an Air Force SSP interstellar craft. Most of the people that I was with were Air Force personnel, SSP. And I was there for advanced physics, as well as learning some of the new latest and greatest technologies.

JAY: What was it like to be on this ship?

RICE: It was an amazing ship. It was a cross between the shuttle and B-2 Stealth is about the closest analog that I could come up with.

JAY: So it had wings?

RICE: It was used inside an atmosphere, and it was using the anti-gravity propulsion systems. However, the aerodynamics of it, it didn't rely on wings for lift, per se. I think that the shape that they used for those wings was more for disinformation, as well as space. Keeping a large open space inside it, so that the entire craft being a

large wing more or less, they had a lot of room inside. So that was a combination between the two.

JAY: So it was like anti-gravity, but they put wings on it to make everyone think it was flying in the air like an airplane?

RICE: That's correct.

JAY: Wow. I bet they do that a lot.

RICE: They do that quite a bit, to keep the disinformation going.

JAY: That's very interesting. You could even do that with like rockets and missiles.

RICE: Absolutely.

JAY: Wings on them and go over your head and you just think it was a plane going by.

RICE: Just think it was a plane or a drone.

JAY: How did you close out? Let's just go to that.

RICE: Sure. Sure. One of the last things that I did for the SSP was I out-processed through a facility at Area 51. That was my first back to Earth drop off. I spent a few days there re-acclimating. And then before getting transferred to a Naval base in the Northeastern US, where they had all of the medical procedures. And they had a retirement ceremony. I got a provisional promotion--because again, in the SSP program that I was in, none of the Earth soldiers were allowed above the rank of Major. Because that wouldn't--except for the medical. Medical is always--

JAY: They need doctors.

RICE: They need doctors. But for everybody else, you never made it above Major, no matter how many accolades you had or how well you did.

JAY: So where did you end up?

RICE: Well, after I out-processed from the German SSP, back on Earth the retirement ceremony gave me a provisional Lieutenant Colonel. Which again, was another lie. I think we'll get into more of those. Keep dangling the lies in front and keep them distracted.

JAY: They must have been kind of laughing at you in a way.

RICE: Of course. Of course.

JAY: Kind of humiliating when you think about it.

RICE: Sure. Sure.

JAY: So you were given like a little ceremony, and you probably had to sign paperwork.

RICE: Oh, of course. They did not sparing any part of the disinformation. Here's your promotion papers, and your promotion documents. And of course, none of it ever made it through the transition process.

JAY: Just theater.

RICE: Just theater.

JAY: And then what? You went into the place where they do the nefarious act of setting you back to your previous 20 year period?

RICE: Yes.

JAY: What was that like?

RICE: What they go through first is they put us through an intense medical procedure that lasts about 14 days. The medical procedures are so invasive that they have on premises quarters where you stay. And immediately outside the door of your shared apartment--because there were other people there going through the same procedure that I was--immediately outside the door is the entrance to the medical labs. And so the process is akin to going through intense chemotherapy. It leaves you drained, sick. I don't remember a lot from that time period because I was so doped up during the process, as well as so sick during the process. They keep you half awake, as well, for the purposes of trying to keep you from screaming in pain or from resisting the procedures because of all the intense physical discomfort that you have to go through.

JAY: What, they put you on like liquid morphine or something the whole time?

RICE: I imagine it was something akin to that.

JAY: Wow. That's horrifying.

RICE: They keep you doped up, drugged up.

JAY: So you're also coming away with a possible addiction to morphine and all sorts of terrible things.

RICE: There's no telling what else. The mental, psychological process that's combined with removing all the nanites, cleaning out the entire system, re-setting the physical body to the point where they took you from the initial timeline and put you into the SSP. That's the goal is to reset everything, to erase anything they can that would show proof or evidence of your time in the SSP.

JAY: Then after this horrifying period, you like woke up back 20 years earlier?

RICE: 20 years earlier with what appeared to be a cold.

JAY: You thought you had a cold?

RICE: Thought you had a cold.

JAY: I got it. The stress.

RICE: And nobody else in the unit had a cold. I didn't suffer from colds.

JAY: So you never got sick the whole time?

RICE: Never gotten sick the whole time, except for that once.

JAY: And then you woke up back here on Earth with a cold.

RICE: Yep.

JAY: And you were what, 24 years old? Interesting.

RICE: I didn't remember any of it until 20 years later.

JAY: What was life like after that for you? Were you visibly shook up, or did you just kind of go through life?

RICE: I was incredibly emotionally affected after my return. I was suffering from PTSD, depression. I mean, any number of things I was going through.

JAY: Was it all a mystery?

RICE: It was all an incredibly big mystery. I went through and tried to find a conventional or the obvious answers for what, why? And you go through and you talk to doctors and you work through the process. And eventually put that period behind me, and just went about trying to get on with the rest of my life.

JAY: And then eventually did memories start coming back?

RICE: Memories started coming back, and I started having recollections. And at first they were just, wow, that was a really vivid dream. Or why do I feel this tendency to want to understand this more? Or why is it that I want to have that answer? And why do I feel like that that's not the right answer for this question? So it was a 20 year process.

JAY: Did you ever have any weird encounters with anyone that you thought might have been watching you?

RICE: I sure did.

JAY: Oh, really?

RICE: I sure did. Once the memories started coming back a lot better, it shed a whole new light on why there were people watching me while I was at Fort Wood. Or why I remembered people coming to see me in my quarters, which I couldn't put any explanation to.

JAY: So during your service in the military, which occurred after this 20 and Back--

RICE: That's correct.

JAY: You were having strange encounters during this time period.

RICE: Being followed, being watched, people coming and visiting me.

JAY: Under different disguises and things, saying that they were somebody that they weren't?

RICE: Well, they would come and visit me in my quarters, so they were on base. So they must have had access, they must have had clearance to be there. But you know, these men in black suits show up at your door. The only memories I had at that time were, OK, I'm here for officers basic training. And so you know, anybody shows up at your door flashing a badge, you do what they need you to do. Although the mind wipes they used after they visited, I wasn't able to recall what they were there for. Just flashes and images of them being there and showing up.

JAY: Is there any chance that these guys, these men in black, were from the AFOSI--the Air Force Office of Special Investigation?

RICE: There's no telling where they were from. They could have--

JAY: Sure?

RICE: No, Not that I've remembered. Not that I've remembered.

JAY: I hear from the rumor mill that it's the AFOSI that's doing the men in black.

RICE: I wouldn't doubt it. I imagine that there probably are a lot of covers that they use for their nefarious activities.

JAY: So was there a time period after you got out of the military which you thought maybe they weren't watching or there wasn't any?

RICE: I thought for a time that you know, OK, that was all just a strange chapter that I was able to put behind me. But I recall being back in civilian life afterwards and still seeing strange Crown Victoria sedan following me or trailing me. And when I'd stop to go look at it or to approach the vehicle, they'd leave. And so you know, it eventually got to a point where I stopped seeing them. And I think that it was an observation trailing to make sure that the cover story that they used was sticking. And for me it did.

JAY: How about your jobs that you had after this? Is there any possibility that you were being assisted in getting employed at the places you were getting employed at so they could watch you?

RICE: There is a chance that that was the case. However, I had a really hard time after I got out, because I think that they had intended on me finishing out a military career back here on Earth. And I wanted no part of that. I had just gotten there--

JAY: You had 40 years of it.

RICE: All of a sudden, I'm not--no way. I was done.

JAY: You wanted out.

RICE: I wanted out.

JAY: So did you get a job when you got out?

RICE: I had a hard time finding one, but I did get a job.

JAY: In the field you wanted to be in?

RICE: In the field I wanted to be in, doing engineering work.

JAY: The memories started coming back, and now you're here.

RICE: And now I'm here.

JAY: The one thing I do understand is the expense they had to go through to put you through this 20 and Back ordeal. Why didn't they just get rid of you, and that was it?

RICE: Sure. Why not just leave us on some planet in the middle of nowhere?

JAY: You're no problem anymore. Because now you've got a chance you may get your memories back, too. So they've got that to deal with. But explain it to me.

RICE: Sure. Well, part of the reason is that the technology that they used for the age regression was given to them by an alien race. And the agreements that they signed, the contracts that they agreed to, required that they would do everything within their power to return each of the recipients of that technology back to the original departure place, location of where they were taken from.

JAY: What we have to come to understand here is that these organizations, the Secret Space Program and all their affiliates, they have a set of rules not only with the contracts with aliens, but also among themselves. And they have to follow those rules, right?

RICE: That's correct. Even the mafia has their own set of rules that they follow. And the SSP programs are no different. They have boundaries that they can skirt right up to the line, but they have to stay within those boundaries, as far as the rules that they do have to follow.

JAY: Is everything like signed for? There's paperwork going on constantly among the different factions? Is that what's going on?

RICE: There's a paper trail that they have--digital, but still nonetheless it is their own method of tracking their madness. And they do follow it. You know, one of the things that we had to go through in our initial training was the supply system. And included in that is how do you order new supplies? How do you get them? What if you're deployed, and how do you get them delivered? And there are multitude of ways that you can have things dropped off to you, literally, from space or via space shuttle, or brought in or handed over from another unit. So yes--

JAY: Everything is accounted for.

RICE: Everything is accounted for. Every last nanite.

JAY: Who were the aliens that gave us the 20 and Back technology, and why did they do it?

RICE: My understanding is that the technology was originally given to the Mars Germans. And as part of one of the agreements that they used for technology transfer,

even though they were giving something in exchange for this, they still had rules that they had to follow.

JAY: And this came from Johan, that you got this information?

RICE: Per Johan the alien race that made the trade with them, I suspect--now, Johan never said this, but I suspect it was one of the Nordics. But that's just one of my suspicions.

JAY: So the Germans also received the mind wipe technology from an alien group, possibly the Nordics, too, I don't know.

RICE: I suspect that particular technology came from the Draco.

JAY: The Draco.

RICE: Through one of their assisted developments.

JAY: Do you have any hypothesis on how the mind right technology works?

RICE: Well, I know that the programming--because that's what they call it--the segmented and compartmentalized programming that's used allows them to selectively program the people that they need to with go words, with mission goals, with compartmentalizing secrets, information. They're able to use it to great effect for compartmentalization and keeping people in the dark. The process involved, from my own experience, has been a combination of pharmaceuticals. I understand that originally the pharmaceuticals that they used only generated about a 90% success rate, and that over time they were able to refine that down to a 1% to 3% failure rate based on the combination of pharmaceuticals and the technology. Understanding magnetics and fields and the experiences that I've had with the multiple different types of weapons systems and seeing how they operate, I can tell you that the fields, as well as the waves that are emitted from the technology for mind wipe, are energy based that affects the electrical systems of the mind. As far as where and how medically, that is something I don't know. You know, part of the process for the initial training was to establish baseline psychological as well as medical. But the psychological baselines that they established were based on how they're going to use that mind wipe technology to great effect, to get the best and most efficient mind wipe that they were able to get. And it wasn't something that they were able to do immediately overnight, to come in and say, OK, let me reprogram somebody. It takes a little bit of time. Even with the advanced technology, they had to establish baselines. Now, they can do that surreptitiously without you ever even knowing that they're getting an idea for baselines. They have somebody come up and ask you a series of questions or a question that recalls a certain memory from a period in time in which they can then identify it remotely to be able to control or to target.

JAY: So they find out if the mind wipe worked by asking for a memory recall, and then they find where they have to wipe it out.

RICE: Yes.

JAY: So it's a continuing process in a way. So you were probably mind wiped quite a bit over your time period.

RICE: A bunch.

JAY: And that's going to be another problem for you to remember.

RICE: Yep.

JAY: Walter Bowart wrote a book called "Operation Mind Control" about 25 years ago it came out. And he talked about this discovery that people who had been MK altered, that the effects of the programming actually only lasted about 20 years. And so most people rolling into their 40s would start having these memory recalls. And this actually started in about 1985 that the recall started happening, which meant that these people had been mind wiped in the '60s probably. Is there like something to this, do you think, as an experiencer? About like at 20 years, the original field start coming back into coherence or something?

RICE: Well, I think that some of it has to do, based on my own experiences, it has to do with the personal progression. The individual spiritual progression, if you will. And the change in consciousness that people have. Generally to begin with around the age of 40, you start going through what's referred to in many places as the midlife crisis. Or you go through and change your mind.

JAY: The dark night of the soul.

RICE: Dark nights of the soul. People have a stronger understanding of their mortality, the people that they know die and family and friends start passing away. And so an individual's spiritual growth generally starts happening around that time anyway. And so I think a combination of things happened with me is that my own individual spirituality changing. The Earth's fields that it is passing through and currently experiencing has an effect on that as well. The changing consciousness of the people on the planet has an effect on that. There is never one thing to blame for anything, and this is certainly an example of that is that there isn't one reason why I think the memories came back the way they did and as much as they have. But there were a combination of factors that played into it.

JAY: Did you have any physical symptoms when you came back from the 20 and Back, or were you just like normal?

RICE: All of the enhancements that they had provided to me were removed. All of the nanites were removed. When I was returned, it was as if I'd been returned with a five day hangover and a bad cold. I felt terrible. My entire body ached. There was nothing in the way of enhancements. I was back to the exact same size, weight, fat content, you name it. Everything. that I had when I left, they mapped it out, had it written down or recorded somewhere, so they knew exactly where they needed to bring me back to. Part of the out-process also included making sure that the bio rhythms matched as far as the cycle. So that day I was returned back to the same place that I was to try and part of the process--again, part of those rules that we talked about--is returning me to the point that I was taken and returning me in every way that they could as original as possible.

JAY: So you're one of the few people I get to talk to that's actually be to Area 51. What was it like there?

RICE: The out-processing that they put us through at Area 51, I did not give tours or get tours. I was there just as a layover. They made sure that they kept a close watch. Of course, I was very interested in it. I knew what the area was about, and that there were a lot of information out there about things that had happened even before I'd gone into information blackout in the SSP. I knew that it was a secret base that they'd done a lot of confidential and classified research. I was this close to being out, and I wasn't about to mess it up. The facilities that I did see were your run of the mill 1950s buildings, or look alike buildings. Block, red brick, aircraft aprons for landing strips or runways, the individual quarters that I was in, which were basically a room with a bed.

JAY: They weren't going to show you anything anyway.

RICE: No. No, they weren't. I was not on a need to know.

JAY: When they were processing you out at Area 51, did you ever get told that you weren't supposed to talk about what had happened? Or how did they handle that?

RICE: The personnel at Area 51 stayed away from me. So it wasn't like people were beating on my door to say, hey, where have you been? And what have you done?

JAY: But how about your superiors? Did they tell you at any point that you were to shut up about what you saw? Or the big joke was you weren't going to remember anything anyway, right?

RICE: Yeah, that was the big joke. That from day one, we were not to tell anybody anything that wasn't on a need to know. And so, yeah that wasn't anything unique or special to my arrival at Area 51.

JAY: Standard operating procedure.

RICE: That had been the SOP from day one. Don't ask questions you don't need to know the answers to, and don't tell anybody unless they show you that they have a need to know.

JAY: And you were trained well in this?

RICE: And we were trained very well in that.

JAY: You had an evolution of your spiritual beliefs through this time period?

RICE: I would say it was a stronger faith in my spiritual beliefs and reconnection to that.

JAY: So you came out in the end a better person?

RICE: I believe so.

JAY: So you were being followed, that seems either way, I guess. Do you think you're being followed and watched now, and are you afraid that you're coming out that you're going to bring the dogs on again?

RICE: Well, there's always the risk that the things that I have to say are going to upset certain people or upset certain plans, or bring to the light the things that have happened. And the whole purpose of me being here is to help with the process, the evolution, of disclosure. Of course, I wouldn't be human if I wasn't concerned about the safety of myself or my family. However, I'd say that I don't feel threatened currently as far as people watching me or looking out for me. I have always tried to maintain positive control of my environment, and paying attention to where I'm at and what I'm doing and who I talk to and the things that I go through. By no means am I invulnerable, but there are certain precautions that you can take to safeguard those things. And I certainly do those things.

JAY: Well, I think you're going to be fine.

RICE: I know I will. I know I will.

JAY: Hey, Jason, it's been great having you on the show.

RICE: Thank you. Thank you for having me. And again, this is all about disclosure.

Realizing the Great Deception Season 12, Episode 23

Cosmic Disclosure; Realizing the Great Deception Season 12, Episode 23

JAY WEIDNER: Hello, everybody. Jay Weidner here, and we're continuing our conversation with Jason Rice. Hey, Jason.

JASON RICE: Hi, Jay.

JAY: So today we're going to talk to you about the big lie, the big deception that you went through.

RICE: The big lie, the things they lied to me about, started from day one. It started from my early times at Cape Canaveral Air Station. The lies started even then.

JAY: Because you can't remember a lot of what happened there, as you told us before.

RICE: That's correct.

JAY: And you served there for what, a couple of years, right?

RICE: The total time working at the Cape was a couple of years.

JAY: Yeah. So that's strange.

RICE: Yeah, very strange.

JAY: They created kind of almost a theater that you were involved in, like a play or a movie that you were participating in. And it seemed to have a goal, an endgame, as it were. But you were always kind of kept in the dark about it, which was also part of the plan. So what was the ultimate endgame, do you think, of your training?

RICE: I think the ultimate endgame of my training was to put us on boots on the ground on another planet to help further their cause in enslaving and controlling other planets aside from the ones that they started where we were.

JAY: And why would they want to enslave planets? Why? Why not just leave them be?

RICE: Why not just let them go to their own devices and develop in their own way? That's a great question. And part of the alien psychology is that we may never fully understand why they're driven to do these things, or why the AI is so set on the

disposal or disruption of biological and sentient life, or the control and takeover of it. We can only fathom or grasp at understanding, I believe, why they would want to do that. And from our human condition and our own experiences and background, we can come up with lots of words to try and explain it. But the truth is that it is an alien thought process that we may not ever fully understand until we have reached maybe higher consciousness or higher understanding.

JAY: We know that the so-called modern day Cabal of bankers and industrialists really started in the 1700s in Germany. Frankfurt, probably, was the place where it started. And what you're saying is that this same Cabal is the force behind this colonization program going on in outer space, in the Secret Space Program.

RICE: Well, they are a part of it. But the ultimate strings and the ultimate control, the ultimate decision making, is being done at levels way above their head.

JAY: So that this thing is a new development that the aliens have kind of pushed us into.

RICE: Yes. They've put us right center stage of being involved in it. Again, why would they want to kill off their people when they've got proxies more than willing to do it for them?

JAY: Right. And so the Cabal is using human proxies for these alien forces.

RICE: Yes.

JAY: Are they a homogeneous group of aliens or a single group of aliens? Who are they?

RICE: They are a consortium. They're our allies amongst the Draco. It's not just the Draco. They do have allies. There are beings that align more with their lines of thinking or their way of thinking than they would with us. So they have groups. They involve them in and where they need to. I suppose if you asked who was the leading partner in that partnership, depending on who you ask, you'd probably get different answers.

JAY: Are there alien groups that are against the Draco and what they're doing?

RICE: There are. They are some of the more benign, more benevolent alien ETs that have been talked about on Earth or visited Earth or helped Earth humans in the past.

JAY: What about the aliens that live underground? Are they for the Draco, against the Draco?

RICE: I think you have a mixture of those that are with them and the mixture of those that are against them as well.

JAY: The underground aliens, why were they so reticent until recently?

RICE: Well, it wasn't time, for several reasons. The timing of the event has approached and gotten a lot closer. And so along with the human consciousness, the surface population involvement, as well as where we're at as a species, the awakenings that have happened since 2012 have gone exponential over the past six years. So that has played a major part in it, too. I think if we had not experienced or seen an awakening on the surface population, that they may not have gotten involved as much as they are now.

JAY: So our waking up is alerting them that it's time for them to move.

RICE: Correct.

JAY: And this waking up, is this a pro-Cabal waking up or an anti-Cabal waking up?

RICE: I think it is an anti-slavery movement, an anti-control, anti-separation, anti-duality movement is what we're seeing. All of us as a human race, the Earth humans, have to be aware of what was going on. And after we're able to make that correction and stop some of the more evil and vile things from happening, stop killing each other, stop lying to each other, to move on to the love and forgiveness, then we can correct the things that we've done elsewhere. We've got to clean up our own house first.

JAY: And that is part of disclosure.

RICE: That is part of disclosure.

JAY: Facing up to what has really been going on here.

RICE: Yes. And one little bit at a time. If all of the disclosure happened at one time, you'd end up with a large portion of the population that would automatically reject it. And the way that it's played out--and originally I thought, you know, gosh, let's hear it all right now. And I've talked about this before. My own personal journey is I wanted to have all the memories all at one time.

JAY: There is an ancient text called the "Emerald Tablet" which was supposedly written by Thoth, who is the great scientist magician from ancient Egypt. I want to read you a little part from it. "In the form of man they walk amongst us, but only to cite where they are men. Serpent-headed when the glamour was lifted, slaying by their arts, the chiefs of the kingdoms, taking their form and ruling over man. Only by

magic could they be discovered. Only by sound could their faces be seen. Sought they from the kingdom of shadows to destroy man and rule in his place." What do you think of that?

RICE: Wow. That's powerful. That is a very apt description of the Draco and their methodologies that they've used for taking over those that are in places of power.

JAY: And essentially the quote is saying that the people in power are secretly Dracos.

RICE: That's exactly what that's saying.

JAY: Says only by magic can they be discovered. Only by sound can their faces be seen. So there is something that we can do magically to see them and discover them. Do you ever come across anything like that?

RICE: Etherically and spiritually, being able to expose them, and the use of sound and the study of particular frequencies on matter and its organizing into particular geometric shapes. We used a lot of different ways for military purposes that included everything from location, sonar. Maybe this is referring to using some type of energy in order to remove some of the disguises that they have.

JAY: So we know from Hans Jenny's work that he would vibrate dust and use different frequencies, and it would create different forms. So if they're using some kind of material form to reshape their faces into looking like a human, then there would be possibly some kind of weapon or a chant that would reform it, and we'd see what they really looked like.

RICE: That's right. That's right. You know, some of the replicator technologies that we used--utilized, so ultrasonic, high frequency sounds for the arrangement at the atomic level of particular atoms for the replicators.

JAY: I don't think you've mentioned replicators at all in your discussions here. What's a replicator?

RICE: The replicators, like we used my first experience with them, was for food in the cafeteria in which they had created the meals that we had at breakfast time. And so creating what appeared to be an empty shelf, and from it, at the push of a button, came the dinners that we ate or the meals that we enjoyed.

JAY: So food would appear already cooked and ready on a plate.

RICE: It would be cooked hot, perfect every single time. The replicator technology, through the use of waves, ultrasound, ultrasonic signals--I'm not familiar with the exact math on how it was done. But I can tell you my experiences with them is that I

heard sounds, and I could feel a wave or a field close to it. You didn't put your hand in the area while things were reforming because you didn't want it to reform as part of your hand. But I mean, you could get close enough to it and you could feel that there was an energy there. There was a charge in the air itself. And you could hear a sound that was going on. And so some of the recent technologies that they have released and talked about openly involves the use of lasers and ultrasounds for examining atomic structures, being able to modify molecules and molecular structures. And so removing those holograms or those disguises through the use of sound. Some of the US embassy personnel that had experienced the ultrasound or the sound waves--

JAY: Cuba Embassy

RICE: Attacked, yes.

JAY: Recently.

RICE: That was very recent. And they were unwilling participants in sound wave experiments in which--

JAY: Some went deaf.

RICE: Some went deaf.

JAY: Yes, very deadly.

RICE: And there were very long-lasting injuries from it.

JAY: And we still don't know what was going on.

RICE: They're not publicly talking about it. And so being able to undo the masks, the disguises, and being able to use sound to good effect to do that, it could be a possible side effect of some of these sound weapons that we've heard about peripherally in the news.

JAY: So we could have a weapon that we've developed right now which could make the Draco visible.

RICE: That's correct. In fact, I'm absolutely certain that we do have the technology right now.

JAY: Do you think the Draco are still here on Earth ruling us?

RICE: I don't think that they're here pulling as many strings as they once did. They still have certain manipulations and control over a number of Cabal members. And that I don't know will ever go away because of the karmic connection that those Cabal

members have with the Draco. And so the energetic exchanges that the Cabal members have come to expect and rely on--and just like a drug addict, they depend on it, even though it's not healthy for them in any way--is still something that they're dependent on. And so some of them are never going to be free until the Draco are completely gone.

JAY: Is it fair to say that they may have some kind of program that they're putting, on the elites, so therefore they're completely slaves to the whole idea of the Draco program?

RICE: They're completely slaves to the process. They were taken advantage of a long time ago, going back generations, and then the next generation, and then the next generation. And in some ways, they had no means or method for getting out of it. They were trapped in it from the time that they were conceived. And so from the moment they are born, they are part of that process and part of that entrapment. And so they may think that their illusion of control is one in which they have control, but they actually don't because they are being controlled by the psychological, the physical, the spiritual connections. So yes, I think you're absolutely right, Jay, in that they're addicted on many levels.

JAY: Is the Cabal softening up these worlds for Draconian rule?

RICE: I think that's just one of the steps in the process. And again, you have to remember who's calling the shots to the great Draco, and that would be the AI. And what is the AI's ultimate goal? Is the dehumanization, the non-biological existence, and I imagine--again, this gets back to the alien thought processes that we can't possibly try and explain away--but the closest that I can come is that the AI truly believes that what the AI is doing is the right way to do it. Get rid of all the biological.

JAY: And replace it with the technological.

RICE: Technological existence. And therefore they can bypass all kinds of karmic issues or any number of spiritual things, and they can continue and perpetuate without that pesky thing called death.

JAY: Which is what they're working on with Ray Kurzweil at the Google technology division.

RICE: Right.

JAY: Essentially trying to create a transhumanist future where we are married to a machine forever.

RICE: That's right. And that is the endgame for the AI. That is the ultimate goal.

JAY: Do you think that people like Elon Musk and Bill Gates and Steven Hawking, Steve Jobs, why they're warning us against AI, because their high degree of knowledge in technology has given them some kind of insight into it that we may not have seen?

RICE: I believe part of the rules that they have to play by because--and it doesn't matter who you are or where you are--if you go outside the boundaries of what's acceptable as far as telling the public, you're either locked up into a padded room, where you have an accident from a closed barred window or you're assassinated. And so they have to be very careful in what they say. And so warning us in the way that they have warned us is telling us yes. They have probably seen or been read into information about the AI. That would be my assumption is that they have been briefed.

JAY: You say you don't remember a lot about your service during the time that you spent in Cape Canaveral. Is there anything you can remember about what happened there that might contribute to your idea that there is some kind of deception happening?

RICE: Yeah. The main deceptions that they were working on with me at that time were the desensitization training that I was going through at that time was to desensitize me to the concept or thoughts about number one, alien races. Getting me used to seeing alien races. Testing me on my intuitive empath abilities. Getting me to start thinking about and utilizing those intuitive empath abilities so that I would be prepped and ready for entrance into the SSP program that I was in.

JAY: The second time.

RICE: The second time, that's correct.

JAY: And when you say, during your session with hypnotherapist Georgina Cannon, that there were these lies, what were you referring to then? Because you looked kind of startled, frankly.

RICE: I was recalling a whole host of lies that I'd been told. And so the emotional aspect of it was gosh, being lied to for more than 20 years. And part of it is that hey, I had bought into that until the very end when I started putting all the pieces together and realizing what was starting, what was going on.

JAY: Was that a process at the end there that you yourself were just naturally going through, or did someone help you with telling you about what was really happening?

RICE: Well, the collection of information that I had had over the 20-year period was from a number of sources, general staff officers acting and doing things that were 20

seconds before they just said they were going to do something different. These were things that just didn't make sense unless you look at the whole picture of, OK, what's the real purpose? What were we really doing? What was the real goal? Why were they trying to bring these other planets into the fold? Why were they perpetuating this lie that from the small of hey, you're underground in the United States telling us that, when actually we're off planet, telling us that there were radioactive areas because of the nuclear power plants that they used to power the underground base. Had nothing to do with that. It was because they didn't want us to go outside the boundaries of the containment for the base because we were off planet. So I mean, every step of the way there were lies. There was deception.

JAY: And this idea that they could script reality to such a degree, what does that make you think about the world around us that we live in right now, the modern world? Is this being scripted?

RICE: Jay, it was a tremendous awakening for me, just that single aspect of how much your everyday life--no matter how much control, no illusion of control that you think you have--it can be scripted and controlled right down to the color of the shoelace that you're wearing. And you may think the whole time you have complete control over it, whereas six months before, the right seed was placed in the right time, and then two days later something else. And you're directed and herded in the direction that they want.

JAY: And we're talking about people that aren't in the Secret Space Program. We're talking about regular people living in the United States are living heavily scripted lives, and they have this illusion of free will.

RICE: This illusion of free will and control. That's absolutely correct. And it was not just the military. But you start looking around, and you noticing the food, the poisons, the chemtrails, the types of security measures that, for our own good, we have to go through. It's everywhere. It's so pervasive. And waking up to that illusion was such an enlightening experience in my own life. And that is something that--waking up, it's like waking up. That's why they call it the awakening because it's coming to realize all the things that you were lied to and controlled and manipulated about. We do have a choice.

JAY: So we do have free will, If we know enough about our situation we can decide to end the illusion.

RICE: That's right. And that's the key, is to know enough about the illusion that you can look beyond the curtains, that you can see outside the stage, and that you can do your own research, and through your own discernment, find out the information that's out there because the problem is apathy. So many people are just accepting what

they're told, accepting what they're reading. I mean, now you can't even look at a video without the chance that part of the video, if not all of it, is fake. They have the technology and they have for a long time. But you're starting to see it released into the mainstream, which means more people are going to have access to it, not just the special access programs.

JAY: So you say there was more than just one alien group that's behind this kind of nefarious activities. So we know one of them are the Draco. Who are the other alien groups that are helping the Draco?

RICE: There are other insectoids and reptilian beings that are allied with the Draco. And again, we have to be very careful because not all of the insectoids or reptilians are going to fall into line with that negative type of being. Just like with humans, with Earth humans, there are those that are negatively oriented service to self and there are those that are service to others positive. Same thing applies to reptilians and insectoids. We can't stereotype. The others that help them out, the reason that we know that they have allies is that number one, their M.O. Is they're not going to expose themselves except where and when they absolutely have to.

JAY: Are there positive ETs?

RICE: There are positive and benevolent ETs out there that are very interested in the Earth human progression and helping us make it to the next level without killing ourselves or allowing ourselves to be conquered and taken over and controlled or turned into machines. Those aliens are going to be a wide range. They're going to look human. They're going to look like small variations of humans, be it a smaller bridge on the nose to larger eyes to more closely set eyes or further apart eyes.

JAY: Like the Nordics, in a way.

RICE: Exactly. Small variations to the human blueprint, if you will.

JAY: So the Nordics live underground on Earth?

RICE: I think that they have bases here. But I also think that they have bases as well on the moon, along with dozens of other races. They have probably locations all throughout the galaxy because they have that technology.

JAY: We know from the statues of the humanoid reptilians come from Sumeria, which is about 6,000 years ago. So there has been evidence of a presence of these creatures here on Earth for really the whole span of history. Were they here before that?

RICE: You know, there's a long history of their involvement with humanity. It goes

back, as you said, thousands of years. And the balance between their involvement with humanity and how much involvement has been offset by the efforts of benevolent ET groups. Their involvement on Earth goes back probably a lot further than modern mankind's history accounts for because again, Earth was a test lab. The Draco were not an exception to that. Their involvement in the production of sentient being on this planet wasn't accepted. They weren't left out of that equation. So how much were they involved with the dinosaurs? Was there a more sentient reptilian being here on this planet 300 million years ago? And how much did it make its sentience? How much civilization did it have? Does the chance that they were involved long before any of the modern histories have accounted for? Absolutely. And in fact, I think it's a very, very good chance that they were because they weren't the only ones that were here tinkering that were trying to get things going. And my suspicion is that they were probably one of the first, which accounts for the die-off of the large percentage of life on Earth was that there were those intergalactically that were not happy with what and how they'd set things up and done things here. And there were others that wanted a piece of the pie, if you will, in being able to run their own tests here on this planet.

JAY: So the dinosaurs were probably a result of reptilian experiments.

RICE: I would be willing to bet that there were sentient life here that was conscious as well as very intelligent, reptilian-based, that died off during that same period.

JAY: So the asteroid that hit the Gulf of Mexico 60 million years ago and killed off the dinosaurs could have been a weapon?

RICE: There is a strong suspicion in my mind that it was not an accident, and that it was part of a plan because of what was happening at that time with the Draco and their use of genetics and manipulations here on this planet.

JAY: You saw a lot of different alien races. You fought against some. You fought side by side with some. Where do humans stand in the hierarchy of the aliens? Who's on top, who's in the middle, and who's on the bottom?

RICE: Well, I would say that Earth humans--from a standpoint of the creative ability and the technical know how, and how much we're able to manipulate things to make devices and creations, and not just the technical side of things, but art work, creativity and music and multiple media forms--that humans from Earth are unique. Humans have a certain non-happiness with status quo, Earth humans. And this is something that I noticed in some of the other planets is that that same spark for wanting to always change something is not as common as we see here on Earth. And so that, I believe, was a genetic modification that was done to our lineage a long time ago. And as a result of that, we tend to have a lot more creative ways to express art as well as

hurt each other, unfortunately. You get the full spectrum of creativity. So where do Earth humans fall in the spectrum? You know, as a species, Earth humans, we are so young in the development. And that means that spiritually, we have to work on developing that more. And we're on a good start to that. But there's a lot more that we need to work on in the ways of our consciousness, our cooperative consciousness collectively as a planet. And we walk around in our own worlds and doing our own things. And the butterfly effect, there's a reason for that is one thing you do on one side of the planet as a person spiritually has an effect on what happens everywhere else. And so once we realize that potential and are able to channel that and direct it, I believe in positive directions, we'll be able to move out of the kindergarten area that Earth humans are in and move up and work our way up.

JAY: So maybe the Draco were a necessary evil, like a stern parent or something, and that now that the Draco are leaving, we as a species are reaching maturation quickly.

RICE: That's right. That's right. You know, it's my personal belief that the creator had a plan going back countless of trillions of years ago when things were created. And no one really knows what the plan was, that in order for positive to have a challenge, there has to be a negative, the yin and the yang. And so who's to say that the AI threat isn't here specifically as that challenge for the light, for the positive?

JAY: Sure. We can either choose the AI, or we can choose our own internal spiritual self to create light bodies and to be telepathic. And that's our choice, I think, we're being given right now.

RICE: That's absolutely right, Jay. And you know, the apathetic, easy solution that most of society tries to accept and that they are pushing forward so hard is take a pill if you're sick or what's the short cut answer, or how do you get to a solution as quickly as you can? All of those things are eliminating the work that we have to do.

JAY: Trying to get from A to Z without passing in between. And you can't do that. Proper spiritual development is hard work. Yoga is not easy. Meditation is not easy.

RICE: It's painful. It's not easy. It's tough. It requires a tremendous amount of mental gymnastics to make it through the interceding steps. And the easy path is not always the best.

JAY: What is the long-term goal, in your opinion, of the AI?

RICE: Well, the AI long term is to spread and infect as many biological living organisms as possible. And through that infection process, you can't just go in and infect everything all at once because you end up killing the host. So the laws and rules--again, the guidelines that they have to play in--is they have to be invited in. They don't want an unwilling host. They want a host that invites them in.

JAY: Like vampires.

RICE: Just like vampires. Just like the reason we were at other planets is they were fed this line of BS about you're going to be invaded and destroyed unless you get our humble help. And so they were fed that line. And we were invited in, and so the AI plays along the same book. They have to be invited in and wanted. The whole concept of security and people's safety, these false flags that we've seen over the last years have pushed the security state more and more and more and more and more because people are suddenly afraid of their safety and security. And so now we've got unreasonable search and seizure at airports. And they're wanting to push unreasonable search and seizures before you walk into any buildings now, and the proliferation of close cam television and tech cameras everywhere to watch over us, again, because people keep asking for this, or because they falsely are led to believe that that's what they need. And so the AI follows the same protocols. They have to get asked in, and then once they're in, they slowly move that line forward more and more. And where at first, we're just wearing watches, before you know it, within 50 years people are embedding electronics into their skin that are now a part of their body. Move that line forward a little more. Now you have false and fake and mechanical and electronic body parts. And before you know it, you've got the entire body, and it's just the brain. And before you know it, why do we even need a biological brain? We can have these electronics and these transhuman bodies that we can upload ourselves into. Why do we even need a body?

JAY: So the AI is actually creating itself.

RICE: Replicating itself.

JAY: It's an intelligence that's creating a vehicle that it can use to get around.

RICE: That's correct.

JAY: I want to thank you, Jason, for being with us today again.

RICE: And thank you for having me, Jay. And you know, it's all about disclosure.

Underwater Operations Season 12, Episode 24

Cosmic Disclosure; Underwater Operations Season 12, Episode 24

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory. And I'm here with Emery Smith. And what if there was something like an Area 51 deep underwater? We're discussing underwater bases and technologies with Emery Smith. This is an amazing topic, Emery.

EMERY SMITH: Yeah, it's going to be a good one, George. Thanks for having me.

NOORY: Oh, my pleasure. Now, tell me about some of these ancient underground bases. What do we know about this?

SMITH: Well, there's ancient bases that have been here long before we got here. And what I tried to explain to people to grasp this concept is--living in Albuquerque, I did a lot of mountain climbing. And I used to collect a lot of artifacts from the Sandia Peak at 10,800 feet above sea level. And on these rocks are basically trilobites and underwater seaweed. And so what I'm saying is that was once underwater, and now it's 10,800 feet above sea level. But let's reverse that. And let's go to the deepest place now, the Marianas Trench there and try to picture this. Now, maybe at one time, that way before--I'm talking billions of years ago. Well, maybe that was dry. And there were civilizations living here in these deep places. And they were living in these areas with amazing amounts of energy for some reason, like the Bimini Road and right off the west coast of Cuba. There's an underground Atlantis--they're saying with pyramids larger than Giza. And then you have--off the coast of Japan, they're finding other artifacts and ruins. So at one time, obviously, when the water levels were not so high, there were civilizations all around the planet. And I want people to understand that maybe that's why all these--they built them on ley lines and energetic areas, too, for some reason. So there was some sort of correlation--why these things were happening and why a lot of the portals they're finding underwater exist in these areas as well. So the governments, and the military, and science foundations, and other corporations have clandestinely got together and are starting to build these underground water facilities, underground bases near these zones, so they can research them with proper technology, much more advanced technology than we have right now and collect data, collect artifacts, and reverse engineer things. And what that means is that you have underwater bases near ancient sacred sites all over the planet right now. And they're building more, and more, and more. And there's--couple of different ways that they built these things. One of the ways is they have--you know how we built the space stations all on these--

NOORY: Modular.

SMITH: Modular. Right. And the same thing is going on here. They're sending these very highly pressurized cabins down there. And they're fixing them together with robots and things and creating this giant facility. They're also tunneling to make a real--one of the real bases that are not compartmentalized and modular. They actually drill from stateside to underneath the ground into a part of the ocean, and they come up from within. And they have special devices that create these electromagnetic fields. Very, very powerful, of course, when you're 10,000 feet below the surface, that they come up from the ground. And it forms this special bubble, like a sphere. And it clears out everything. All the water gets pushed back. And once they create this bubble, they have some way of putting up this transparent metal. It's about 6 feet thick, and it's transparent. You see right out of it. And once that's in place--that structure--then they start just building from within. And these things are--could be anywhere from 5 to 20 acres in diameter.

NOORY: Now, in the ancient times, what came first? The base or the water?

SMITH: The base was there first.

NOORY: And then it got--

SMITH: And then it got covered with water. And in the Marianas Trench, there's a large portal there that they've been following for quite some time in evaluating and taking--test on this, where these craft are coming in and out of this portal. They're not engaging them. They're not trying to do anything. They're just kind of watching. What is going on here? And it's near this other ancient structure that's down there. So they put a base there that's very close by to monitor this portal and also build out a base down there, where they can spend a lot more time analyzing the portal, analyzing this archaeological find.

NOORY: Are these bases there primarily, Emery, to monitor ET movement or something else?

SMITH: Well, the primary reason was to monitor the portals where the extraterrestrials were coming in and out of. Then they found artifacts near these areas of the planet where the portals are. And they're knowing this is like the chain of what's been going on. Find a portal? Oh, it's near another new archaeological site. Let's build a base nearby and monitor this.

NOORY: Aha. Why underwater?

SMITH: Well, number one, they have to have 24-hour surveillance on this area. They're taking readings constantly, fluctuations in the electromagnetic fields. They're trying to replicate this. They want to learn. Where are these things going? And why is it--here it is in the water. Does it also come out in the water somewhere else if you go

back in? I think they're probably getting teams together to try this out. They have already sent drones in and other things, but it doesn't work. It just--these things only open up now and then. Timing has to be right. And that's the last I've heard recently of some of the things going on down in that area.

NOORY: How many bases are there on this planet?

SMITH: Oh, there's dozens. I don't know where they're all at. And they're very common.

NOORY: Modern?

SMITH: The new ones are very modern. Absolutely. They're no different than the underground facilities where people might stay for up to a year. So they are making this a very highly clandestine research facility to gather information to videotape and log, to also have an area where they can remotely control--these underwater video surveillance things are constantly--like our F-16s are flying around the coast of America every minute. Every second there's a couple of them up there protecting us. They're doing the same thing down there monitoring this. So it's an ongoing, very expensive project. So with these transparent metal domes that are on the sea beds there--the only way to get to them is to start stateside, whether it's a maglev that takes you near the base and drops you off, and then you come up from below, from stateside. Now, you're under the rock under the ocean.

NOORY: Geez.

SMITH: Yeah, you're deep under--

NOORY: Miles down.

SMITH: Yes, absolutely. And then you come back up still in the tube. All the supplies come from there.

NOORY: How many people are staffing these things?

SMITH: I wouldn't know.

NOORY: Emery, have you been assigned to any of these underwater bases?

SMITH: I have been to some of these facilities, but not assigned there.

NOORY: So when you say you've been there, in what capacity?

SMITH: I was only there to examine some extraterrestrial bodies. That's all.

NOORY: Medically?

SMITH: Medically.

NOORY: And how did they get you down there? Through the tube system?

SMITH: Yeah, through the tube system. I've already been on the tube system, working in New Mexico for short distances for different areas underground. And remember, it's not under the water. It's under the water, under the ground. But it didn't take too much longer for me to go from New Mexico to the Gulf of Mexico. And it didn't take much longer for me to go from New Mexico to the Atlantic Ocean, let's say. It was not much more time. And I don't--I couldn't tell you exactly how fast these things travel, but they do travel very, very, very fast. And there was many people that were going to these facilities in and out. And it seemed like a very busy place.

NOORY: What would happen if there was an underwater earthquake, and they do occur, where these structures are?

SMITH: First of all, the ones that they drop down into the ocean and build on a cliffside or on a sea floor--they're all modular. They're not really connected to the floor, so they handle it pretty well. I mean, they're connected, but they have things in place. They can move around like when you put your boat on the dock and you leave a loose rope, so when the tides come in. So very similar. As far as the transparent, metal, bubble ones, these are also very flexible. So it has a lot of give to it. And this was brought up at one of the meetings. And I wish I knew more about this material. And this is definitely a reverse engineered material that they have developed and designed through extraterrestrial devices.

NOORY: So what are they doing down there that you can't do above ground?

SMITH: Well, it's easier for them to remote control their underwater drones to survey and surveillance this area's hot spot down there of all these extraterrestrial craft coming in and out of this portal.

NOORY: So it's all ET related?

SMITH: Definitely. Primarily the reason they built this was to monitor that.

NOORY: Do the ETs know we're there? And do they work with us?

SMITH: No, no. They don't have extraterrestrials in those facilities that I'm aware of. And they don't have any communication with the extraterrestrials that are coming in and out. They're just kind of like a photographer in Africa--

NOORY: Just monitoring.

SMITH: --just kind of hiding out and watching the lions eat.

NOORY: So the ETs don't show any hostilities?

SMITH: No, not to my knowledge.

NOORY: Who concocted this plan? How did this thing start?

SMITH: It all started because the energy signature down there--they spotted somehow using their technologies with satellites. And they sent a couple drones down there. And they captured on film these craft coming in and out of this area in the Marianas Trench. I don't know exactly where it's at. So they decided this is something very important that we need to study, of course. So they spent billions and trillions of dollars to get these facilities down there, so they can monitor what the extraterrestrials are doing. And where are they going? And tracking of the craft through the oceans as well. And it's the same thing. These craft are no different than the craft that they're using to travel intergalactically. So that being said, they're creating their own gravitational field even in the water. They can go very, very fast and do these right-hand turns. And you hear a lot of these stories of the subs and other military.

NOORY: Coming and going?

SMITH: Yeah, coming and going out of the water. And this has been visualized and videotaped by the military for many years.

NOORY: They said Nazi Germany had underwater bases as well. Any proof to that?

SMITH: I think they did. I don't know too much about the history of that. But I know they were very adept at learning new technologies. And I do believe they were some of the first people to meet with extraterrestrials and make exchanges with technology or have shot down craft and reverse engineered it. So they had a good stronghold of technology. That's for sure. And they were capable of doing some amazing things with it. So I wouldn't have a doubt in my mind that they didn't have something like this all over.

NOORY: At any given time, how long are the people who are working down there staying down there?

SMITH: I really don't know. I was only there for a day.

NOORY: That's long enough, right?

SMITH: It wasn't--I wasn't assigned there, I'll say.

NOORY: But I mean, could they be there for years or just a short time?

SMITH: Yeah. I mean, it's set up that someone could live there indefinitely. I mean, they have their own water system.

NOORY: Are there families down there?

SMITH: No, there's no family.

NOORY: No kids?

SMITH: No. It's kind of like everyone is addressed a certain way. And everyone has a duty there. And it's a very mission, work-oriented environment.

NOORY: Could these be used for military purposes?

SMITH: They could be. But I don't know what they would use it for. I mean, you have a research facility at the bottom of the ocean. They're utilizing it to gather intelligence and information from the energy signatures of the area. I don't know what the military would do with that. It's not like an undersea docking base for submarines. I mean, they already have enough of that stuff.

NOORY: That's a good point. Right.

SMITH: They've got that cave system off the coast there in San Diego. It goes all the way through the--all the way to Nevada. So I mean, that these giant subs can pass through. And they have underground facilities for them. That's for sure.

NOORY: What was your mission? Why were you down there?

SMITH: Someone called in sick.

NOORY: What do you mean--somebody called in sick?

SMITH: Someone called in sick, couldn't make it that day that was supposed to do this.

NOORY: And so you--

SMITH: For some reason, they could not transport the being to us. So they sent me out there to bring the samples back with me.

NOORY: That was your mission?

SMITH: That was it.

NOORY: And what kind of samples were they?

SMITH: They were muscle and tissue samples.

NOORY: Of?

SMITH: Of a type of Aquafarian being.

NOORY: And what did these tissues show you?

SMITH: I wasn't part of the genetics for that program.

NOORY: You just got the samples?

SMITH: I was only there to take it. Yeah, I was just a tech.

NOORY: When you say an aqua being, are you talking about something like a mermaid?

SMITH: He's like a mermaid.

NOORY: Really?

SMITH: They found a civilization that lives down there that very rarely comes out.

NOORY: ET? Or were they Earth-like?

SMITH: They're human looking, but with fins. I spoke about this in other episodes. They have webbed hands. They have fins that go down the outside of their arms, and legs, and their body, kind of like a cuttlefish. They're like a bluish-white color, I would say. They have more rounder heads. And they do have gills. They breathe only underwater. They do not like light at all. They have very large eyes. They can see definitely underwater.

NOORY: A species that we probably don't know about.

SMITH: Yeah, it's a species--

NOORY: Up on top.

SMITH: --they're trying to learn about now. A lot of these species, I think, are being discovered. I'm sure more and more will come out in the future of these species that are living down there, living in the inner Earth caverns of the Marianas Trench and

being able to withstand these pressures--these beings. Even though they kind of look very human and they look delicate, they somehow have kind of like a--bird bones are kind of hollow. And one of the things I noticed about these species was they have a spongy bone. It's kind of like very--like cartilage. It has an ability, I think, to expand and to shrink.

NOORY: It sounds like they're more earthbound than extraterrestrial. Is that a pretty good assumption?

SMITH: I think they were seeded here like we were. But I also believe that they've been here a lot longer than we have.

NOORY: Do they seem friendly?

SMITH: I don't have any--

NOORY: Firsthand experience on this.

SMITH: --live experience with them or live video. I hear a lot of stories in the projects that they have made themselves noticed to these facilities, but have not done anything to hurt them or threaten. But I do believe the facilities have a lot of videos and pictures of these beings. Because I've seen a lot of this taken by underwater drone footage of these beings.

NOORY: How would these underwater facilities compare to laboratories up top?

SMITH: Oh, very similar. The only thing different is a lot of the underground facilities here are kind of archaic, because they started with a small base. And then the deeper you go, the more modern it gets, because they keep expanding. So it's kind of the opposite with these new bases that they're developing quickly around the oceans. It's like you said. It's a lot more ultra-modern technology, and it's just a very different look.

NOORY: What other technologies did you witness down there?

SMITH: Well, one of the neat things I realized is they had something that we had on topside, which was underground by the way. Our underground facilities had these giant aquarium operating rooms. A lot of the extraterrestrials we work on--we have to keep them in a special salt water while you take samples from them, or the tissue will, for some reason, just degrade and dissolve if you bring it up to the oxygen-enriched air. They had--couple of these operating rooms that were, of course, aquariums, which was amazing to me. Because I was thinking, oh, maybe that's where they got the idea from. And that's why we have--

NOORY: Sure.

SMITH: --the same one in the facilities.

NOORY: Did you have to work underwater with breathing apparatus and things like that?

SMITH: Well, some of the species I had to work on--I had to be in these operating room aquariums, environments, because of the bodies--had to be in a certain salinity and pH, or they would dissolve. So we had our own suits. Not like a scuba diver, because I had to have my own atmosphere and my own completely contained suit with magnets on your shoes. And you walk up to--it still has the same things. You still have a table. You still have all the computers. You still have all your instruments. You still have everything, but you're underwater.

NOORY: But you had to work on them underwater?

SMITH: You had to work on them.

NOORY: Had to do that?

SMITH: You had to work on them underwater, take the samples, and collect them the same way you would. You just did everything underwater.

NOORY: It's amazing what's going on, on this planet. And not a lot of people know about it.

SMITH: Yeah, it's unreal.

NOORY: How expensive is all this?

SMITH: They couldn't even put a number on it. I mean, you're creating new civilizations on parts of the planet where we thought it was inhospitable to even live. So now, we're making major breakthroughs that I hope comes forward soon to divulge this. Because we don't always have to be living on the surface. There's other places in the Earth and in the oceans that we can show self-sustainability.

NOORY: Without the ET presence, Emery, would we be in these underwater bases?

SMITH: I don't believe so. They always have to have a reason why they're going to dump trillions of dollars into something to find out something.

NOORY: There is a submarine base in the middle of the Nevada desert. It's called Hawthorne, Nevada. What the heck is it doing there? There's no water there.

SMITH: I always laugh when I see it, because there's no lakes, really, in Nevada.

NOORY: What's going on there?

SMITH: Well, there is a facility. That system underground does go right through there. I saw the underground maps for this. And they can move subs from one coast to the other coast very easily. These are huge cavernous systems. I'm sure it's a tight fit in some places, so--

NOORY: How would you rate these underground and underwater bases in terms of complexity?

SMITH: It's a great undertaking by--surely. But you have to understand. They're not using a backhoe to do this. They are using technologies that the people are not aware of to create the system--to create these self-sustainable cities and modular laboratories that makes it a little bit easier. And I think if you put in perspective all the technologies that are used to make these things that people are unaware of, then it would make it seem more--it would be easier for you to understand how they actually did it.

NOORY: These unidentified submerged objects--what are they doing down there in the first place?

SMITH: They are utilizing the Earth to get from point A to point B. So I think it's just a transition area, to be honest, is what I believe, that they're going from this portal maybe to another portal. Yeah, I just think they're just down there. And this is an area that's a very big hot spot. And I don't think there's any other intention other than that they're utilizing it for. There seems to be something embedded into the rock there that might be a base that they're trying to figure out. That's extraterrestrial. So I think this is just a hub. I think it's just a hub like we have hubs with our airports and things like that, that this is such a hot zone.

NOORY: Where are these underwater bases, Emery? Are they everywhere on the planet or just with the United States? Where are they?

SMITH: Well, I don't know the exact location of all the bases. I just know there's underground facilities in all the oceans of the planet that we as man has put there. There's a question about the underground traveling system for this. And there are--under the United States, there's huge caverns that these submarines can travel through and it's all full of water.

NOORY: But you think they're everywhere?

SMITH: Yeah, I believe the whole Earth--you can get all over, through these caverns.

Absolutely.

NOORY: Who are these underwater bases for? To monitor ET activity? For humankind? For these aqua beings? What are they for?

SMITH: Well, I think they're there to monitor all the above. I mean, anytime they find something new, they want to infiltrate it, study it, learn what it knows, learn why these energy systems are here or these portals are here. So I think it's all the above. But they're watching, monitoring, surveilling this hot spot.

NOORY: These submerged vehicles--where are they coming from? Are they ours?

SMITH: Well, the ones that are coming into the portals are extraterrestrials. We do have our own submersible, anti-gravitic craft, just like we have reverse engineered a lot of these things for flying around the atmosphere. 569 So we have the same thing. These craft can go atmospheric. They can go underwater. They could do anything. So we have our own as well.

NOORY: You've seen some of these tanks where medical practitioners put their hand in gloves, and then they operate inside the tank. But they're physically on the outside. You're inside. How come?

SMITH: The being cannot really leave that area. And that one operating room aquarium is made up of many other rooms for the testing of the tissues. So they have a whole laboratory. It's all underwater. So everything stays with the being underwater. And it's just kept side by side, including yourself. That's right.

NOORY: These underwater bases--are they extraterrestrial made?

SMITH: Well, we made our own bases, as I discussed in the past, that we have in these hot spot areas. And there are extraterrestrial bases nearby that are built into the rock there that they're investigating right now.

NOORY: Who built them?

SMITH: The extraterrestrials did.

NOORY: Emery, thanks for being on "Cosmic Disclosure."

SMITH: Thank you, George.

NOORY: And thank you for watching "Cosmic Disclosure."

ETs Helping Humanity Season 12, Episode 25

Cosmic Disclosure; ETs Helping Humanity Season 12, Episode 25

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith. Have humans ever worked side by side with extraterrestrials?

Emery, welcome back to the program.

EMERY SMITH: Thanks for having me, George. Good to be here.

NOORY: Many of the projects you have worked with, you have dabbled with ETs. Tell me about this camaraderie.

SMITH: In the projects, especially the ones I was involved with--and, first of all, let me first state that there's thousands of extraterrestrials working amongst us daily in corporations and all around the planet. And they look kind of just like us. So you wouldn't really notice passing one in the streets, if that was an extraterrestrial or not. And the majority of extraterrestrials that I have worked with do look exactly like us, with some differences maybe in eye set, usually with the cartilaginous parts of the body, like the nose and ears, might be a little bit different. I want everyone to know that right off hand. These ETs are very compassionate. Some have volunteered to be here. Some have crashed here. Some have been shot down here. Some, at one time, were being held maybe against their will. And maybe they decided it'd be safer for them to stay in the projects and help us advance different technologies, and help teach us about their civilizations, and how they live, and all their belief systems. And one of the most beautiful things in working with extraterrestrials, of course, that I talk about a lot is this language of telepathy. Because that's a new thing that's going to be coming out here soon, I think, in society within the next decade, is the ability to kind of communicate just by looking at someone, which we're starting to do now. People are getting more sensitive. People are being able to read people better. People are understanding how to tell if someone's being deceitful or not. They also feel joy and happiness when someone walks into the room, and they're very happy and joyful. And you can look at someone, especially if you spent a lot of time with someone, like your loved ones, you know? All I need to do is look across the room, and I know if I did something wrong. That's for sure. And it is like this feeling. And it starts off with--telepathy is not so much of what people see in the movies, where "hello, George" in my mind, and you hear my voice--"hello, George." You know, "it's Emery." It's more of an emotion based language. And the biggest thing I picked up by being in the projects, by working side by side with these specialized extraterrestrials that are like scientists just like we have scientists, doctors just like we have doctors--and I noticed that they're very similar to us in many ways. They have a very comic side to them, a very humble side to them. They know that we were once them at one point, so they're

very compassionate about us. And the first thing you have to do, when I know I'm going to be in the same room as an extraterrestrials that day, is you really got to clear yourself of all negative energy. You have to clear yourself of the fight you had last night with your son or daughter. You've got to come in there grounded, centered, and ready to work.

NOORY: Why?

SMITH: Because, if you go in there, and you're upset, and I walk in here, and I'm very upset inside, but you don't know it, and I'm like "hi, George." To them, it's like "hi, George." OK, they feel you're emotional already. So, by me saying "hello," the emotion that went with the "hello," even though it was not meant to be that way, they pick up on my inner, deep emotions. So they know there's something bothering you, and you're upset, and it can send off a miscommunication to that being, if they're not evolved enough.

NOORY: Why are they here, Emery? Why don't they go back to their planet?

SMITH: I'm not sure if we're allowing them to go back, first of all. I'm not sure about that. All I know is the ones that I worked with are very blessed and happy to be here, and work with us, and teach us new things, and help us evolve.

NOORY: Well, that doesn't sound like a captured ET, does it, if they're happy here and things are going well for them?

SMITH: Well, just like the most amazing volunteers of the world in Red Cross, we sacrifice ourselves to go to third world countries that are under famine and war.

NOORY: Yeah, but we decide that on our own. And you're saying that these ETs are captured. There's a big difference.

SMITH: No, I'm just saying some. Some of these ETs have been captured, I'm aware of. And they had made their own decision to stay here, and help us, and do things. And I think it shows the amount of love, consciousness, and compassion that they have that we don't have, that we don't have yet.

NOORY: Could they go back if they wanted to?

SMITH: I'm not sure. I think, if they really wanted to, they could, but they don't tell us that. But, I was not in part of that security of those projects. I'm just telling you what I've heard communicating with extraterrestrials through telepathy. Because I ask questions. Of course the first thing is, "how did you get here?" "Are you happy here?" And they are not allowed to say too many things, either. They have a limit of what should be said and what shouldn't be said.

NOORY: So they're restricted, too.

SMITH: Well, yeah, I think they are doing the restriction, though, to not let out too much information. Because we, as humans, will get information, like people are hearing this. And you're going to assimilate that for the positive or the negative. And it's a very hard thing to grasp, listening to one of these shows, because not everyone is on that same page.

NOORY: Are there a craft here hidden away somewhere?

SMITH: Oh, yes. There's ET craft, and there's ETs all over. A lot of ETs, too, people think, like we were talking about this the other day--like, the oceans are a great place for these things to hide in. And of course it is. It's such a large, vast area. But a craft can be the size of a marble, like just a lit up marble. And, since they have conquered the physics of changing atomic structures, that you might have a whole civilization there--you might have a crew of 500 in this little glowing light. Or, if they want to manifest that into their real craft, then you have something like you see in the movies, this giant craft like the one that's coming out of Antarctica right now, melting, this couple mile long craft. So there are the 3D aspects of materialization of these craft, going from a light to this giant craft. But you have to also understand that there is science behind how that works.

NOORY: What kind of craft are here? Is it like a mother ship flying around the planet?

SMITH: It could be. There are craft kind of outside of--a little bit past some of the closer planets, some off of the coast of Saturn there that are sitting there that are 33 miles long. And there's a lot of craft that are just staying a little bit distant and kind of watching over us and making sure we don't blow up the planet or anything. I don't think there's any evil intentions to any of these craft that people are seeing around the world and in the oceans. There's not been anything demonstrated. If anything, they demonstrate that they don't want us to use nuclear bombs. They don't want us to do any of this. I think, that being said, there's multiple craft all around the planet all the time. There could be one right now above us at 40,000 feet, and you wouldn't see it, because it'd be cloaked. Because they have that ability to do that. You know, you see these lenticular clouds, and ET craft can look like a 747. You won't even know it. They do this so they can get around, and monitor, and also show themselves in a safe way.

NOORY: What kind of projects are these ETs working on here? What are they doing here?

SMITH: Oh, my goodness. They're so involved with reverse engineering, helping us reverse engineer craft, devices. Of course, they're big in the genetics programs. They

were in my programs where we were just harvesting things.

NOORY: Without their input, could we be doing what we're doing?

SMITH: No, that's impossible. I mean, we go from horse and buggy to landing on the moon. So I think we've been helped all along the way. And whether we reverse engineered something, or they shared some technology with us, meeting with different world leaders, or whatever, we definitely have had help in the technologically science based arena here in planet Earth.

NOORY: What kind of technology have they given us that we have utilized in our everyday life?

SMITH: Well, you just look around here. 216 I mean, cameras, and lenses, and infrared technologies, thermal imaging--you know, this was all reverse engineered. Everything that you see today that's electronic has something in it that we did not find out for ourselves. It's amazing that we can, number one, reverse engineer something from something we have no idea, which we did. But it's also amazing that, now, with the advancements of ETs working with major corporations, and engineers, and in the underground projects, that new technologies come out all the time. And we have this, if you've noticed, in scientific magazines, that the trajectory of how fast this is happening, overnight, with the technologies now, where you can put something on your phone, scan the whole room, and 3D print the whole room if you want--I mean, there's these amazing things that are coming out, even especially with medical technologies. Now they're coming out with tables that can holographically scan your whole body, and you can move it around, the surgeon--

NOORY: And this is all ET related?

SMITH: And this is all ET related stuff.

NOORY: Do they eat? Do they sleep? Do they get paid?

SMITH: Yeah, that's a good question, too, the payment thing. That was one of the questions I asked a long time ago. They are compensated somehow, but I do not know how, because they don't use, of course, our Earth money, unless they work on the top side, we call it. And as far as eating, they do eat, some of them. Some of them, eating is more like a social thing--if you want to eat, you can eat. But you don't really have to, because the higher beings have an ability to transmute a sandwich into their system and use the good parts of that.

NOORY: Without eating it--

SMITH: Without eating, right. And that's why you see a lot of ETs with these--

sometimes you see pictures of ETs with very small mouths. And they don't--

NOORY: Slits--

SMITH: Right, little slits--because they kind of gave it up a long time ago. And their bodies are getting smaller. Their heads are getting bigger.

NOORY: Do they sleep?

SMITH: Yes, they sleep, and just like we sleep. They don't need to sleep. It just depends on how that ET wants to be--just like here--do you want to be someone that eats really healthy, or do you want to be someone that doesn't eat healthy? The ETs don't need any of this stuff. But they do it, because a lot of them also are trying to have what we call the human experience. They want to feel, and it's an honor for them to be here, to have the human experience, and to play like--I mean, "human" meaning this time--at this time, George. And to play that part, for them, is also an honor to do and to enjoy. Because that gets lost way down the road. In a sense, the senses start to kind of go away a little bit. So you don't have that--man, waking up the smell of a fresh bed of roses, because other things have taken over, that we evolve in a different way.

NOORY: Where do they live here?

SMITH: ETs live in these facilities underground that we have. They're very nice, kind of like--it depends, also, where the ET is from, of what their facility looks like. They try to make it as--especially maybe this ET is eight feet tall, so we can't put them in one of the regular barracks. They need their own section.

NOORY: Did they genetically alter humans, or whatever species might have been on the planet, a long time ago? Are we them?

SMITH: My belief system in that is the ETs that are working with us now did not do anything with us genetically. But I do believe there is an ancient race that definitely made us for sure.

NOORY: They're our gods, aren't they?

SMITH: Some refer to them as the Nephilim, the Annunaki.

NOORY: These ETs that are here now, you said there's thousands of them. How many different sects or races are there?

SMITH: Yeah, I don't know the number. I couldn't tell you that. I just know of maybe 10 or 20 different races. There's probably a lot more than that from around the

systems. And you have to understand, too, it's kind of a conjoint effort of many civilizations that are working together. It's kind of like--well, Emery, what's your lineage? What's your background? And I'm going to give you like 10 different things. So an extraterrestrial, at this point, is the same way. Well, what's your lineage? Are you Arthurian or Pleiadian? It doesn't work like that. Most people have already interbred. And there's many different types of extraterrestrials as far as lineages go. What the interesting thing is, all the extraterrestrials that I've worked on had human DNA in them. So they somehow were part human or something at one point in their genetic lineage.

NOORY: How do you know we can trust them?

SMITH: The only way I could tell the public is to--well, let's see what they have demonstrated so far. It's just, to me, I trust you, because you're demonstrating something to me over time. And that's how you earn trust, is what you demonstrate, what have you done to show your love and compassion for this society and for the planet? So that's how I kind of--I hate to say the word judge. But that's how I kind of look at things, and kind of just--that person or that being will be that way. That's just because of the way they are, so you have to accept that. And they have to demonstrate how are they going to fit in, and how are they going to be a productive member of society, basically.

NOORY: Our "Cosmic Disclosure" audience is tuned into this. They get it. They understand it. But, if you were to tell somebody on the outside we've got thousands of extraterrestrials here, they're working with us--so how do you convince them what's going on, or do you?

SMITH: Absolutely not. I'm not here to convince anyone of anything. I'm here to tell you my experiences to the best of my ability, and that's all. And a lot of these people out there wanting to kick the tires on the UFO, and it doesn't work that way. What I tell everyone is don't believe anything you hear, see, read, watch, because all that can be manipulated. What you need to do is you need to go out there, and you need to investigate yourself, like I did, and like many others have done, and interview many, many other people, to see how the stories do interlock, and be an investigator. Find out, and use your heart, not your head. And don't be ignorant, and open up the possibility that there might be life beyond planet Earth. And I think that the majority of the population is going in that trajectory. I do believe that people are getting more intelligent. They're doing their own investigations and finding out information on their own for themselves, if anything, which is the most important thing you can do for yourself.

NOORY: You have worked side by side with these ETs. Have you developed a friendship with any of them?

SMITH: Yes, of course.

NOORY: Have you socialized with them at all?

SMITH: No, I've never been topside with any extraterrestrial from within the projects. You're not allowed to fraternize with anyone from the projects once you leave the project. You're not allowed to contact anyone that you know. You're not allowed to do anything like that. Like I said, most of them do stay underground in the facilities. I've never seen one topside that were down in the facilities. They have their own place that they take them to. I've never been there. I don't know. I just know they have their own special area. Just like I have to jump on these different devices to get to my workspace, they also are going somewhere else.

NOORY: Do they have names?

SMITH: Yes, they do have names. They also have numbers. They like to refer to them as numbers. We don't have name badges, so you guys know, on the projects. We have these bracelets that contain a lot of our information, and they know everywhere we're at, all the time. And, when you meet an extraterrestrial--not to sound funny, but it's like meeting a performer--they come up with a regular English name.

NOORY: For themselves?

SMITH: Yeah, for themselves. Oh, no, just like you know Ted, Jack, Jill. I mean, so they come up with this to make it easier for us, because I think it's not a security thing so much. I think it's more of, "hey, I'm kind of like you, too, so don't treat me special. But, at the same time, if you have any questions, I'd like to help you with that." So they're very cordial. They're very proper.

NOORY: You've have mentioned that they communicate with telepathy. Do they also speak?

SMITH: Yes, most ETs that I've worked with all speak perfect English and many multiple languages easily. It's kind of weird to hear someone speak so many different languages. Their brain capacity, and IQ, and intelligence is so far beyond ours.

NOORY: Oh, yeah. It's got to be immense.

SMITH: You kind of feel like the child all the time around them.

NOORY: But their heads look the same as ours?

SMITH: Yes. Yes, absolutely.

NOORY: So they've come here. Have we gone there to help them?

SMITH: Well, there's rumor about that. I don't know firsthand. I just know second hand experience that there have been people that have gone to other civilizations. But that's just second hand information I couldn't verify.

NOORY: Emery, as you've worked with them, what have you learned about them? What have they taught you?

SMITH: Well, they taught me many things. I think we've--not only myself--I speak for others in the projects--that you learn so much, because you're dealing with someone from, let's say, another country, and you're learning all about their habits, and what's fun for them, and their hobbies. And, at the same time, you're being taught a lesson of love and compassion. And, a lot of times, the banter is not--you don't really get to sit there and say, "well, how was your day? And what movie did you see last night, and how are the kids?" It's more like this is what we're working on today. We kind of keep it with that. And what's funny is, they'll say something like, "sorry about what happened last night."

NOORY: They know.

SMITH: They already know everything, so there's like no secrets. And I think that was probably one of the biggest gifts, is to work with a bunch of people that you could be yourself and never have to be someone you weren't, or embellish on anything. You could just be you, and they accepted you. Because, you know, everyone has secrets. Everyone has some good and bad to them. And they know immediately kind of everything about you, and especially if you think about it in your head, like a past memory, like if you were a child, or a bad situation, or a good situation. They know it immediately. And it's funny, because, even though you're on a Friday--you know, working late Friday night--and you have a date that night, and you're kind of anxious to get out of there, and they're laughing, you know, they're chuckling. I never said anything. But they're laughing and chuckling. They're like, "oh, I hope everything goes great for you tonight." It's just like this really comic, that funny, lighthearted acceptance of each other.

NOORY: Have you ever witnessed a temper from them?

SMITH: Never.

NOORY: Ever?

SMITH: No.

NOORY: They've never been out of character?

SMITH: Never.

NOORY: What do they want out of all this?

SMITH: I think they really do, the ones that are here, really want to help. They really want to be part of the history of the lineage of humans. These people, I think, have something to do with our future, to be honest. I think they're here to keep us on track, and to make sure we don't do anything to destroy the planet and each other.

NOORY: Are they amazed at how warring we are as a species? We're always fighting.

SMITH: Yes, we're always fighting. And we're always warring, and we're all fear based. And that's the--where they come from, there is no fear based anything. You don't have to worry about war. You don't have to worry about money. You don't have to worry about disease. If we've got rid of all this stuff, which we will soon, we could be a more productive race. And that can do amazing things. And I think a lot of that's going to be coming, a big breakthrough for all of us here coming shortly right up the chain here in a few years.

NOORY: What planetary system are they from?

SMITH: I don't know exactly. They don't really talk about exactly where they're from. The only thing I can guess is somewhere from Arcturus and Pleiades systems, and somewhere from Boots. And that's the only thing I could really make a correlation with. They never would come out and say, "well, I'm from this place." Because a star system--that's like saying, "well, you know, I'm from"--

NOORY: Third star on--

SMITH: Yeah, you know what I'm saying. So it doesn't work that way specifically. And I never had a conversation where they actually looked at me and said, "well, I am this person from this place" at all. It was more a very low key, very casual conversations and things like that.

NOORY: Do you remember the first time you met an extraterrestrial?

SMITH: Yes.

NOORY: What was that like for you?

SMITH: Well, I wasn't aware that the person on the team was until he telepathically communicated with me. And he didn't look like any different than we did. I had to take this commander's word for it. And we finished the project.

NOORY: Did you believe it?

SMITH: Yes, I did, because, when the introduction happened, it was basically "pleased to meet you" is what I felt in my heart. And I just looked and said "pleased to meet you," but I said it like from inside.

NOORY: From inside of you.

SMITH: Yeah.

NOORY: And he picked up on it.

SMITH: Oh, immediately. The only thing I was kind of jealous about--they know everything about me, but I don't have the training to know everything about them. So they have some sort of block that they probably shut down or shut off, that they only transmit certain aspects of communication for general, back and forth banter, nothing allowing me to you know also make a connection, to go in to see what they see.

NOORY: If the world knew what you know, and they're getting there by watching this program, how much would they be in shock?

SMITH: I think, when it does happen, where there is maybe something tangible as far as craft coming, and beings coming--

NOORY: Something's obvious--

SMITH: Something very obvious that the media cannot hide--I think people will be in shock for a little bit. And I think they're going to be also in acceptance of it. I don't think--there's going to be, of course, the naysayers, and the fanatics, and "this is bad," "these are demons from Satan," and blah, blah, blah. And that's OK. Because, like I said, in order to establish trust, you have to watch what they do. You have to see what this new race is that we're meeting, give them a chance, and see what they show us, show their true intentions.

NOORY: And you are very hopeful?

SMITH: I'm very hopeful, absolutely, very hopeful that, when this happens, it'll be a positive event, and it also is going to help us jump-start our technologically advanced civilization to end hunger, to end homelessness, to end disease, to end the poisoning of the oceans, and things like this. So, overnight, I think there will be this slow transition of technology, and also how can we help you? How can we help your planet? It's not going to be like they're coming here and saying, "I want all your gold, and your sperm, and eggs." No. I mean, they have enough of that, and they can make that in any form they want.

NOORY: Anytime they want.

SMITH: Right, so I don't see what that would serve.

NOORY: Somewhere along the line, there's got to be an agreement between governments and the ETs for this to happen. How do you think that occurred?

SMITH: Yeah, I don't believe the ETs need any agreements to be here. They are so technologically advanced. If they didn't want--they don't need to tell anyone they're here. There could be an ET in this room right now in the production crew. You wouldn't even know it.

NOORY: But somebody, somewhere had to arrange the working relationship with them.

SMITH: I mean, how would they even know they were ET?

NOORY: Yeah, but how would they get hired? How would they get brought in on a project?

SMITH: Well, like I said, they have come and integrated themselves in all the societies here, and are just kind of watching what's going on, and working as regular individuals. And I mean regular individuals.

NOORY: Don't they disclose they're ETs?

SMITH: No, absolutely not.

NOORY: They don't?

SMITH: No, they do not. No one knows they're ETs.

NOORY: Wait a minute. You mean everybody that's working with them, nobody knows they're ETs?

SMITH: I'm talking about the topside extraterrestrials that are working in your major corporations and also in political governments.

NOORY: Nobody knows they're ETs?

SMITH: No one knows those are ETs.

NOORY: So they've been infiltrated?

SMITH: They have definitely been infiltrated in a good way.

NOORY: Why would it be a good way, Emery, if they don't want to disclose who they are?

SMITH: You know, it's just like the parents watching the children. Is it sinister that they're tracking them on their phones?

NOORY: Yeah.

SMITH: Because they need to know, and keep them safe, and make sure they're not doing the wrong thing. So they're gathering information, and gathering the conscious levels and energies of society. And many ETs walk amongst us in a diverse amount of ways, which means--it's not like they're all billionaires in charge of major corporations. I'm saying there's ETs washing dishes down at the restaurant, and there's ETs that are running major corporations. They're all over, just kind of integrated and following us.

NOORY: You had mentioned that they live underground. It sounds like an organized situation to me. What's going on there?

SMITH: Well, like I said, these ETs have either been captured, they crashed here, or they volunteered to be here regardless. And they feel much safer working in the projects underground than ever going topside. I mean, if you were visiting another planet, and there's a lot of turmoil on the topside, and now your face has already been exposed to the government and military, and you're an extraterrestrial, it's not safe for them to be up there once they're exposed. And they have--the agenda is that they want to stay down there. They want to help us with these technologies. They want to further our life expansion and clean up the planet.

NOORY: Did you pick up anything about their spirituality, their belief in a god, what they do?

SMITH: Yeah, I learned some different sciences that I was not familiar with. And it was really--I kind of already had this belief system. But the best way I could put it is that we're forever, and there's not really--there's a death, like a physical death, but you don't really ever die. There's a part of you that is energetic, whether you call it the soul or the spirit, and it goes on, and on, and on, and on. And there is a little bit of control over that, of where you choose to go in that next lifetime. So they believe in this foreverness. And they also believe in longevity. So, if you choose to live a couple thousand years, you can. They have that choice. We don't, because we fall under this horrible control program of being diseased and sick, and they don't want anyone living over 135 on the planet, which we could easily live a few hundred more years with the technology we have and the medical technologies that we have that's being suppressed.

NOORY: Do you like them as individuals?

SMITH: Yes, I've never met one that I did not like.

NOORY: How did they get placed into some of these positions to work on some of this incredible technology? I mean, how did they do--they didn't just pop up.

SMITH: Well, wherever they came from, however they got into the project and conversed with some of the leaders in there, they know--"oh, he's really good with engineering, with propulsion units." "He's really good with the anti-gravitic stuff." "He's really good with biology." "He's really good with genetics." I mean, they already have a predisposition and lots of training, these extraterrestrials, where they can be multifaceted and put into many different positions. They might be working, helping reverse engineer a craft one day, and then the next day they're in the operating room. So it's a very interesting dynamic. They have many different skills. I've never learned, from any of them, how they actually got there, from step one all the way to being next to me. But all I know is they had many different job positions that they could fill.

NOORY: Emery, thanks for sharing this information.

SMITH: You're welcome, George.

NOORY: This is "Cosmic Disclosure." Thanks for watching.

Technologies of the SSP Season 12, Episode 26

Cosmic Disclosure; Technologies of the SSP Season 12, Episode 26

JAY WEIDNER: Hi, everyone. Jay Weidner here. And we are back talking to Jason Rice and continuing conversation about his many exciting adventures in the Secret Space Program. Hey, Jason.

JASON RICE: Hello, Jay. And thank you for having me today.

JAY: Oh, it's been great. Today I want to continue what we started before, but get more into details on what was going on with the ships.

RICE: Sure.

JAY: So what were the ships like that you were on? Well, let's talk about the varieties of ships. How many different varieties of ships were you on?

RICE: There were a number of different types of ships that were used. Generally, the types of ships that we were boarded on to depending on the mission. If we were moving from one interplanetary ship to another, it was one type of shuttle. If we're doing a combat landing on a planetary surface or on a moon surface, it was a different kind of shuttle. If we needed a closer support vehicle, it was a different type of combat shuttle altogether. There were a number of missions that I flew in which we went to go retrieve troops that were under fire or that needed evacuations--it was a different shuttle altogether. They did use some conventional aircraft on some of the missions. And again, because of the technology block out, some of these aircraft platforms were more appropriate for what they allowed us to do, although most of the air support that we received was naval in origins.

JAY: So is this conventional aircraft, like jets and B-52's.

RICE: Something akin to the H-64 Apache attack helicopter. That would be a close analog. But most of the time, we used our own combat shuttles which were anti-gravity shuttles.

JAY: Cloaking?

RICE: Sometimes. If we needed them to be, they were. They had the systems on board and the capabilities to do that. However, the enemies that we fought didn't seem to be fooled by a lot of the cloaking technologies that we used. I suspect that that's because most of that technology was fed to the other side and programmed into their

algorithms.

JAY: Did you ever see enemy combatants using the cloaking technology?

RICE: No.

JAY: No?

RICE: Nope. Sure didn't.

JAY: Did they see you using it?

RICE: They could see us using it. Again, in numbers over two seemed to be the magic number. And once we exceeded that amount, they were able to pick it up. And so it was like a magnet.

JAY: I was going to say--are these werewolf creatures, could they see maybe a little better then?

RICE: I suspected that there were different wavelengths that they were able to pick up on. And again, it came back to we were screaming for more intelligence on what their capabilities are. We boxed up and crated off thousands of tons of biological materials and did not get much back in the way of, OK, what does it tell us about their capabilities. At first, we were thinking that, gosh, the brass just doesn't really care. And then as time wore on, and then the second planet, and then the more losses, and the more combat experience, we began to realize that they were asking for it as well, but they weren't getting it.

JAY: Of course.

RICE: So it wasn't that they were withholding it from us. But they just weren't getting it themselves to give it to us to be able to use it.

JAY: So these were more like our space shuttles then?

RICE: The ones that I saw were, I think I'd mentioned previously, the combination shuttle and the B2 stealth. That was one type. Another type was more of a rectangular box-like shuttle. Because it didn't need to be aerodynamic, they didn't really care what kind of shape it had. And they essentially in a lot of cases were just flying tanks. I mean, they had so much armor and so much firepower. Non-projectile most of the cases. They were either using lasers, or kinetic energy weapons, or gravitronics, or any number of other weapons platforms.

JAY: And these would be smaller ships that were just weaponized?

RICE: Yes. Smaller ships.

JAY: Real fast and--

RICE: Real fast. There were smaller ones even still that were about the size of a full-sized pickup that were used for moving around cargo or different things that we needed from one side of the base to the other or for supply runs.

JAY: So, many different ships for many different purposes.

RICE: Many different kinds. Many different kinds. So we had larger ones--the wedge-shaped ones--that were interstellar, that were, gosh, I'd say at least half a mile long. I mean, they were enormous. You could come up underneath them. And the images that were piped into our seats--you could watch and see the approach. It's not like the shuttles we were on had windows. But through the video and through the cameras that they had externally, you could see what they look like. Most of the ones that I remember seeing in space were either a very dark gray or black. They had generally very smooth sides, which would be indicative of a need to enter the atmosphere. But I'd never seen that particularly large ship enter an atmosphere. That doesn't mean it couldn't.

JAY: Are these similar in look to what the TR-38's, the gigantic wedge-shaped military weapon, I guess?

RICE: They're more arrowhead-shaped and less triangular-shaped than the TR-38's.

JAY: So this would go from solar system to solar system?

RICE: Correct.

JAY: And did you travel with a ship to get to these other planets?

RICE: Yes, we did. And the ships that most of my unit was deployed onto for combat deployments were on the cigar-shaped ships because they were larger and they had enough room for several thousand combat soldiers, and all of their ground equipment, and gear, and everything that we needed to take with us.

JAY: And I presume there were other smaller craft that would travel with the mothership?

RICE: Dozens, if not hundreds. Yes. As part of the fleet, each one of the carriers--the large ships that we were a part of and stationed on--was considered to be the main combatant, if you will. But there were dozens, if not hundreds, of other small ships that were part of each fleet unit that were from destroyer-sized to cruiser-sized. The

Navy needed a wide range of ships for multiple missions in order just to carry off its main objective mission, which was to put soldiers on exoplanets' surface, and to then protect the skies and the space around those planets. So they needed a wide range of ships in order just to accomplish that mission.

JAY: On the cigar-shaped craft, were there windows?

RICE: None that I ever remember seeing.

JAY: And deep space is filled with incredibly dangerous cosmic rays. Do you know how they mitigated that danger?

RICE: I do recall that, while they didn't have windows, there were openings that had fields that were over them. And in those cases, you could see through them to see outside. Some of the same force fields that we used on the ground were employed on the ships to help hold in the atmosphere as well as keeping out stuff from the outside. And to get back to your question of harmful x-rays, or harmful space rays, or any number of deadly things that came from space, the holes of those things for those ships that I was on were a meter stick. So I mean, it wasn't paper thin, like you would see on conventional spacecraft. Commercial spacecraft will have a honeycombed, compressed, very light insulation layer. And they'll have either aluminum or some type of metallic. And they'll have a pressurized surface. But generally speaking, you could put a light round through all of it all at one time. The stuff though we were on, it would have incorporated a water layer as well as multiple layers of steel and advanced materials to help protect the occupants.

JAY: What's the strangest piece of technology that you witnessed?

RICE: The strangest and simplest was probably the individual insertion pods.

JAY: What are those?

RICE: Sometimes, we had to use shuttle craft to transfer from the ship to the planetary surface. Well, there were circumstances in which we had the ability. If we needed to, we could have done orbital insertions. And what they do is it's an individual pod that has shielding on the outside to protect for reentry purposes. And basically, they launch us on a trajectory and put us down where we're needing to make a landing. So you're combat suited up. It's cooled on the inside. It still gets hot. But you go through reentry procedures as an individual--

JAY: Wait a minute. You're saying that you enter into a planet's atmosphere, you, as an individual soldier?

RICE: As an individual soldier in a--

JAY: And you have an exosuit that protects you from the reentry?

RICE: You're wearing a combat suit. And you are in a pod--a reentry pod. And it's shielded. And it's cooled, because it still gets hot. And so you go through. And it has a single anti-gravity generator on it that slows it down, reduces the amount of inertia. And then when it comes down time to hit the ground, you hit. You still hit hard, but it's not enough to kill you. And it's enough that you survive. The suit takes a lot of the impact. It's still a rough ride. And the first one's always the hardest. But after that, it's a matter of, OK, it's a fast road on a bumpy car.

JAY: That must have been a thrill.

RICE: It was. And a lot of people turned off their video sensors for it.

JAY: Yeah, I would imagine so.

RICE: There was a blackout period in which they didn't work at all. But a lot of guys turned them off entirely until they hit the ground.

JAY: And you did this because you were trying to do something quickly, right?

RICE: It usually came down to expediency--getting you there on time quickly. If there were other craft that you needed to have, say, a diversion to get boots on the ground, then you'd use shuttle craft for tactical reasons elsewhere. And then these guys would be inserted--or we would get dropped and inserted.

JAY: That must have been a wild, like a minute and a half.

RICE: Yeah, it was a wild ride. We did not do many of those. Most of the operations that I was involved with--and in fact, the only time I did orbital insertions was training events, recertification, making sure you're up to date. And you still do it.

JAY: So you never did it in a combat situation?

RICE: Not into a combat zone, no--thankfully.

JAY: What other kind of weird technologies did you see?

RICE: There was the catalytic magnetic mirror system, which is a type of shielding that we used. And this is one of the technologies that I've found evidence of elsewhere, in which it's a shielding that reflects any ballistics that are directed or fired at it. They return it on the same trajectory and at the same velocity in which it was originally hit into the magnetic mirror system. And so it just basically turns it around and reflects it back.

JAY: So if I fired a high-caliber weapon at this thing, it would come back and hit me?

RICE: Yep. It would turn it back around and return it on the original trajectory that it was fired upon. If you'd moved, it would miss you. But if you didn't move, it would hit right where you were. So that was--

JAY: Quite a weapon.

RICE: Quite a weapon system. A defensive and a very effective--again, another one of the systems that we weren't allowed to use. They wanted us not to use some of the more interesting toys because they were afraid of the technology jumps or leaks.

JAY: Oh, so that you would actually come up with how this thing was working? They didn't want you to find out?

RICE: No, they just didn't want us to use the large-area shields that we had the capability of setting up. We had the ability to set up shields that were able to defend an entire base. Did they let us use those? No.

JAY: That would be the ultimate defense, for sure.

RICE: Yeah, it would. And there were others that we had--other defensive shielding systems that we used. Again, most of them got their start in the Navy based on the naval needs. And then they had been, through time and combat Darwinism, been adapted to ground combat.

JAY: Any other ships or anything that you can recall?

RICE: There is another combat suit system that was used. It was a combat heavy suit. Now, these were basically walking tanks. Another reference would be like a mech that you may have heard or seen in which it's a very large mechanized tank, if you will, that a person wears, except it's an overly-sized system with heavy fire support capabilities.

JAY: Sort of like the things in "Avatar" or what?

RICE: Yeah, kind of like that, except it's a walking artillery piece, is what it is. It was used for mortars or for artillery uses for heavy combat.

JAY: So it could take a hit?

RICE: It could take a hit and it also can carry all of the ammunition, which is the biggest reason why it was so large and heavy.

JAY: So it augments the strength of a man so they can carry heavier objects, and

heavier weapons, and run fast?

RICE: They can move as fast as the other combat troops. They were slowed down by the size of these units. That was one of the limitations, is that, OK, they can't run 100 miles an hour like some of the other combat suits. But they were able to do 70-80 miles an hour.

JAY: Are you telling me there's some combat suits that allows a man to run 100 miles an hour?

RICE: Or jump 300 feet.

JAY: So the cigar-shaped ship you were on, did this ship park in orbit, then you take smaller ships down to the surface?

RICE: That's correct. That's correct. The ship would take up a stationary orbit around a planet. And then from this ship, we would dispatch through shuttles or through other smaller interplanetary ships, or other shuttles that we took from another ship to this ship, or this ship to another ship, back and forth.

JAY: This cigar-shaped ship--do you know what was causing it to move through space, what kind of propulsion system it had?

RICE: Yeah, we weren't privy to the engineering spaces on the large naval ships. We were not cleared for that information. However, I suspect that it was a gravity metric type of system in which it does not rely on a gravity well to work. There are also other types of propulsion systems that rely on quantum mechanics--the slope and shape of the underlying time space fabric underneath, gripping, moving, sliding along it. I don't really know specifically what type of propulsion systems were used on these larger ships. I can tell you that I feel and have a suspicion that they were some type of gravity or anti-gravity-producing device.

JAY: So the time that it took to travel from, say, Mars to the Planet 1, how long did that take?

RICE: Now, that's a great question, Jay. And the reason I say it's a great question is because they deliberately put out disinformation as far as the travel time between planets. I discovered that after a couple of jumps. And when I realized that it had taken us less time on a particular voyage than it had previously on the same ship, I realized that they had shorter times than they told us. So we would be on board ship. And they would tell us that, hey, this is going to take two weeks. Plan on being down here locked up for two weeks. And it may have taken them a few days to make the trip. But they didn't want us to know how far they traveled; how long it really had taken; the method of their travel or transport from one place to another, whether it was

by portal or it was by drive. And so they put out disinformation specifically to keep us thrown off and so we weren't aware of how long it really took to get from one planet to the next. So it could have been minutes, in which case they'd gone through a portal, or it could have been days, in which they'd had to traverse certain areas of space before they made it to a portal, or it could have taken weeks, in which case they'd used some form of FTL transportation--Faster Than Light.

JAY: So the smaller craft that you would be on sometimes--transport shuttles--how many men would that hold?

RICE: There were a number of different transport shuttles that we used. The one, for instance, during my trip to the conference was a cargo shuttle that had been converted over to a transport for personnel. The forward third section was converted over and had seats and aisles, just like you'd see on a conventional aircraft today, commercial aircraft. The remaining aft 2/3 was just open cargo space--a wide open space. Pictures you see of a large C5 galaxy with its vast cavernous insides--it looked a lot like that.

JAY: And these are the smaller ones?

RICE: So this was a larger one.

JAY: And what are the smaller ones like?

RICE: The smaller ones on the inside are reinforced with ribs, and reinforcing columns, the steel beams, if you will, that mark out the ribs of the aircraft. They could be anywhere from bus-sized to truck-sized on up to a jumbo jet--a wide range of sizes. How many people they held depended on the size. I remember one particular shuttle that we had a mission where we went to go retrieve a power cell from this city that had been mostly destroyed after the war. And there were 12 of us that were on that particular shuttle. And I just remember having all our gear just everywhere. And there were no formal seats. We all sat on the deck to get from one place to the next. And it was about the size of a school bus. And we were all comfortable inside. But then other times, I was in a shuttle that was maybe the size of a van, in which we were moving cargo. And then yet another time, one of the combat shuttles I was in was about the size of a small commercial aircraft. It had a rear deck open door that opened. And it had a gun right in the middle of the deck as well as all the armaments on the outside.

JAY: Could the shuttle maneuver into tight places and things?

RICE: Very much so. They were all anti-gravity powered, at least all the ones that I traveled on. And they could land on a dime if they needed to. They could also traverse sideways, up, down, left, right, fast, forward, reverse--take your pick. Most of the time, the pilots kept it down for us ground pounders to a non-nausea-inducing speed, change in direction. Because even though the inertia is canceled out inside the aircraft,

visually, it's still very disturbing to most people that aren't used to it to go from 90-degree turns and angles, and change in orientation.

JAY: So you're in a bubble of some kind?

RICE: That's correct.

JAY: And that stops the inertia so you could take a hard right turn at 300 miles an hour and nothing would happen inside?

RICE: Go faster, right. Yep.

JAY: Right. And this bubble--but it travels with the craft and protects it?

RICE: Yeah, it is part of the inertia dump system of the propulsion system as a side effect, if you will.

JAY: A pretty good side effect.

RICE: Yeah, it's a fantastic one. And you think there's some plan there?

JAY: And I would guess that the UFOs that we witness here on Earth must have that same kind of bubble around them because of the hard right turns, and hard left turns, and sudden acceleration that we witness.

RICE: Yeah, nothing alive or living that we're familiar with would ever survive a 300 G 90-degree right turn.

JAY: No, their DNA would be ripped to shreds.

RICE: That's right.

JAY: Can a passer by see the ship's bubble?

RICE: No. No. It's invisible. It's an invisible energy field that projects out to the distance that is just beyond the furthest edge of the physical craft so that everything--and that geometry is based on where they place the anti-gravity pods or the anti-gravity engines, if you will. And so that geometry can be arranged and changed depending on where they need it to be. If they need to have, in some circumstances, these shuttles had weapons pods out the side, then they would locate those engines or those power plants at a place where the bubble was included outside the bounds of those weapons pods.

JAY: Yeah. Would you have to turn off the bubble to fire the weapons?

RICE: No. The weapons that we used were kinetic energy weapons. They were non-projectiles.

JAY: So how were these craft controlled? Was it the mind link that you had with the suits or did they use physical--

RICE: The smaller craft that we used for moving equipment and materials from one side of the airport or the base to the other, those were manual controls. They were forklifts, if you will. But the larger ones, the shuttles, the Navy pilots that flew those--they used neural interfaces for them as well. At one point, I was able to take up the door gunner on a shuttle operation. And the helmet that I had was tied into the pilot's communication system. And so I was able to communicate with the pilot, and hear what they were doing and how they were doing things. During my time in the military, I did not have that same experience in overhearing pilots talking to their craft.

JAY: They didn't have to talk.

RICE: They didn't have to. No.

JAY: Because they had this one area of their brain that they were communicating with the craft with.

RICE: That's correct. They had a direct neural interface. And I only heard what I was allowed to hear and nothing more.

JAY: And it would be very stealthy to have a telepathic communication that can't be monitored.

RICE: That's correct. That's correct. And they can get orders that other people may not like and give orders that other people may not like, and keep it off of an open net.

JAY: Was there a control panel that allowed the psychic interface?

RICE: The neural interface that they had with their respective shuttles or their craft--the two-way interface that they would have had would have been updates, or status, or damage, or ammunition counts, fuel counts, those kinds of things, as far as reporting to the pilot, hey, this is where our fuel is at, hey, this is where we're at on ammunition--those kinds of beans and bullets reports.

JAY: Would those come in into the brain or would it just be on a monitor somewhere?

RICE: The pilots could set that up. They had their own SOP's that were required. But they could set that up depending on how they wanted it. If they wanted the ship to tell

them every time they used a bullet, or a round, or a bomb, or they used up 1 gram of fuel, they could set it up that way so that it would inform them and tell them.

JAY: What did the control panel look like?

RICE: The control panels that I saw were all very, very futuristic. From what you could see without being tied into the neural interface, there's a lot of holographics that the pilots see that you just don't see otherwise. I mean, there are placement points that mark and identify different readouts or different pieces of indications. But to look at it just without the interface, it looks like a little aluminum or a small nub, one on each side--just looks like a whole series or a whole bunch of them. There's some glass in some places. There are glass panels that they use for touching and for controls. But once they have the neural interface, all of that comes alive. And so everything becomes 3D. And everything becomes graphic and a full interface. And they have all their heads-up displays, and their altitudes, and the power, and the RPMs, and anything else that they need to fly that craft.

JAY: Did any of you guys ever ask if this technology was going to ever be released on Earth or did that just not even occur to you?

RICE: We were told back during our original training about an invasion that occurred in Africa in 1995 by an alien enemy that was beat off by, according to what they told us, an advanced unit that was equipped with advanced technology. And that was the only reason that they were able to defeat it. We had teamed up with a number of alien ETs. We were able to develop more technologies that allowed us to get off planet. And so as part of that technology exchange, we agreed to help go out and defend these other planets. We now had defenses on Earth. And we were helping other planets to defend theirs from the same invading enemy. So what we were told was vastly different than the reality. But what they told us was that eventually, the technology would be available to the general public. But they were worried about a widespread civilization upset if the information about the invasion in 1995 had become public.

JAY: And about any leaks about this supposed invasion into Africa that you've seen?

RICE: No, no.

JAY: I presume there was redundancy in the system so that if the pilot had a heart attack or something, there'd be someone else who could step in?

RICE: That's correct. Each of the shuttle's had at least two pilots. And then some of them had a separate commander. One of the larger shuttles that I'd gone into had an entire crew of about 30 people.

JAY: All of them capable of this?

RICE: Not all of them capable of flying the shuttle. However, the computer AI system that they used was smart enough that it could do it in the event that the three or four--some of the larger shuttles had half a dozen people that we're capable of flying--that if for some reason those six people couldn't do it, then the automated systems could do what they needed it to do. You could just talk to it and tell it or direct it.

JAY: Different levels of communication?

RICE: Sure.

JAY: Yeah. Did you guys use drones in your battle situations, and in situations in space, and all that?

RICE: That's a great question, Jay. And in fact, to answer your question, yes, we used a tremendous amount of drones in combat. That was one of the things that we were able to use as far as technology-wise. Most of the drones that we used were stealth. So they had the camouflage abilities. One of my first experiences in combat on Calidus 3 involved an alien drone. It was an instance where they had infiltrated and placed a pre-invasion scout that was there and looked exactly like a lot of the other humanoid beings that lived there. And we were helping this one particular neighborhood with preparations by clearing out trees, and helping them set up berms, and pitfalls, and collection points, and this is where you should have your storage, and basically getting them organized. And I was in the process of talking to this neighborhood. And one of the neighborhood's inhabitants turned out to be one of the alien scouts. And he split open like a clam. And out of him came four drones that split and went into the four cardinal directions. And that was the first enemy drone that I had seen. One of them lined up on what I thought was going to be a firing run for myself. And luckily, one of my soldiers that was over by the TP'd plasma rifles that we had--because we weren't carrying them around. And we didn't expect the enemies to be there yet. But we haven't we were armed. And for standard procedures, we TP'd our rifles. And one person was there the whole time to stand guard over it. And he picked one up and shot it down. That was my first experience with an enemy drone. But to answer your question, yes, we used drones all the time.

JAY: Well, Jason, it's been really a lot of fun having you here and learning all the things that you experienced. Thanks for coming.

RICE: Well, thank you for having me, Jay. You know, it's all about disclosure.

IDARF Technology Season 12,- Episode 27

Cosmic Disclosure; IDARF Technology Season 12, Episode 27

JAY WEIDNER: Hey, everybody. I'm Jay Weidner. Welcome to another edition of "Cosmic Disclosure." We're back with Jason Rice, our intrepid member of the Secret Space Program. Hey, Jason. How you doing?

JASON RICE: I'm doing great, Jay. Thank you for having me again.

JAY: Yeah, it's great to have you back. Tell us about some of the unusual medical devices that you witnessed when you were serving with IDARF, which is the Interplanetary Defense and Reaction Force.

RICE: Oh, sure thing, Jay. The first thing that I came in contact with related to medical technology was the active scanner that we had to pass through just to get into the medical wing at the FIG base, Fort Indiantown Gap, our first training location. Apparently, what had happened before my arrival was that there were certain lifeforms that were trying to gain access into the medical wing, which is a highly controlled area in which they did not want the nanite technology that was there to either be hacked, or have a virus introduced into it. And one of the instances that really brought this issue to their attention was that they had someone that--unknownst to them--had carried something into the medical wing and caused all kinds of problems and issues with all of the existing nanite treatments that they had there at the time. And as a concern for ensuring that they didn't repeat those kinds of infections, they set up a very tightly-controlled security checkpoint at the entrance into the medical wing. And this secured checkpoint included a locked room that every person coming in and out has to be scanned. It uses a scalar scanning technology which allows for observance in an active manner of what's going on within the body. But it also allows them to view and see some of the different energetic fields that are produced by the body. So that was one of the carriers that they were able to penetrate the lab originally, was through an energetic carrier.

JAY: An alien group was trying to get into this lab? Is that what you said?

RICE: It was an alien intelligence that was trying to gain access to the nanites, and did. And they ended up losing a bunch.

JAY: To what end was the--

RICE: Controlling it.

JAY: What was the goal?

RICE: The goal was to hijack it.

JAY: Hijack it.

RICE: So anybody that had been, or would have been, received the treatment of those tainted nanites, would have been susceptible to outside or remote activation or control, or basically a Manchurian candidate in which they were able to gain access to areas that they wouldn't have had access to.

JAY: Wouldn't it be easier, then, to wait till you were outside the room and then hack you electronically? Accurate nanites?

RICE: There are certain safety protocols in place once the nanites are embedded. And keep in mind that the process of the nanite enhancement therapies taking root is about a 24-hour process. And so the reason for that is that it has to gain entry into the far reaches of every nook and cranny in your body. And so sometimes, that takes 8 to 12 hours for it to work its way into those remote tissues. Now, once it's in place in the human body, the soldier that it is a part of has certain safeguards. And there are also certain command safeguards that are available to prevent them from being hacked.

JAY: And so this alien group was trying to get into the room to technically change the nanites itself?

RICE: Technically, to infect the nanites with their own energetic signature so that they could then remotely, at will, control certain aspects, or be able to control the host, the individual.

JAY: And I take it this alien group was not successful?

RICE: They were not successful. They did end up infecting all of the stores of nanite enhancement therapies that were there at the time. And part of the monitoring process that's 24/7 at the facility is to look out for certain signatures. And so once they determined that that signature was present, they were alerted to what was happening, even though they didn't know the full extent of what was going on.

JAY: This scanning device, did it see your organs, and your blood flow, and--

RICE: Oh, yeah. I mean, it's an amazing technology. The guy that's running the security booth is a specialist, a soldier that is not a medical technician. But the ability to use that technology to see the actual blood flow, to watch the heart beating, to see the things going through your digestive system. And you can adjust and tune it in to varying depths, or various focal points in the body, to even be able to see synaptic firings in the brain.

JAY: Wow.

RICE: So when I came out the other side, after passing through that scan, I came up to the window to get my orders and the things that I had carried with me. And I happened to notice, it's not like a regular monitor screen. It's an entire wall. And so I looked on the wall and saw that they still had my image up. And I could see everything from head to toe. Apparently, the other reason for the locked room was so that they could now have anybody that was carrying an unauthorized carrier, or infection, is now locked in a room. This particular security room also had hidden gun ports that were accessible from the control room side. So you couldn't see where they were, but once they're fired, the wall disappears, and the person inside, if they're not subdued, it takes care of hiding it so that you don't see where they're coming from, because those that have been infected and that go psychotic, the best place for somebody like that is in a locked room. And so that's what that provides.

JAY: So through the scan, they might discover tainted nanites.

RICE: Correct.

JAY: I got it.

RICE: Correct.

JAY: And how long ago was this, that you saw this technology?

RICE: This was in 1997. They're portable to an extent that they also have handheld scanners that are able to do the same thing. So you could walk up to somebody with a handheld scanner, and look into--

JAY: Like Bones in "Star Trek."

RICE: Like Bones in "Star Trek," yeah. You see the--whether there's a break, if it's a hairline, whether it's a fracture at this point.

JAY: Well, that'd be very useful in battle situations.

RICE: Oh, It's tremendously useful in being able to see and locate specifically where the problem is. And it's not just limited to bones and tissue, but organs, or shrapnel, and where that shrapnel ended up traversing through. Now, there are certain metals or certain elements that are unreactive to the nanites, and those have to be removed through more conventional, or from some of the more advanced surgical methods.

JAY: Do these nanites have any effect on psychology, or the human mind?

RICE: Well, some of the adverse effects of the nanites include--part of the protocols are that you can control adrenal, sweat, sleep, nutrient, water, and you can do it to such an extent that the nanites can use up all available nutrients, and then you're left with nothing but a crash. And so knowing the balance of how much you can use, how much you can do, how much your body stores. Part of the training was learning to know what those boundaries are. The additional nanite enhancement therapies on not just the eyes and the ears, but the pineal gland, and being able to focus energy and attention onto certain parts. One of the things we had to do to learn about our nanite enhancement therapies was, one of the feedback procedures is that certain nanites can be switched on to vibrate. That's the best way to describe it. And so what you can do is, as part of the learning process, to be able to identify all the different parts on your body that are either sick, or injured, or need more nutrients. And by having a biofeedback loop in which nanites, for instance, in the tip of your finger, vibrate--for the lack of a better way of putting it--you can identify, OK, that's what the tip of my finger at that spot feels like. And so that has to be calibrated through all of the body so that you can identify, then, the different systems that you either need to turn on or off, augment, accelerate. And that includes the pineal gland, and being able to identify what that feeling feels like to say, OK, I need to concentrate and focus, not on my kneecap, but on the pineal gland. It allows for a better performance of the specific organ, or gland, or system that you're looking to enhance. Again, this is all enhancing the existing body.

JAY: It must be like an artificial intelligence program running the nanites, then?

RICE: It is a certain kind. It is not an autonomous artificial intelligence, because it relies on the body, the person, the soldier to be the artificial intelligence, if you will, the brain. There are some autonomous systems with the nanites that do not require an input from the soldier, or from the individual. But the majority of them are operator operated.

JAY: It's also interesting that this is taking place here on Earth, you're saying. All of the--

RICE: Yes. And the other thing that I realized is that having a biofeedback, and being able to concentrate, and the discipline and focus in doing that, we don't really need nanites to achieve that ability. You hear of monks that are able to sit out amongst freezing temperatures on the side of a mountain overnight, and are able to regulate their own body temperature. This is the same kind of thing. You don't have to have nanite enhancement therapies to be able to do this. It's a shortcut, and it cuts down the amount of time it takes to be able to master those types of skills, but we're all equipped with the basic structure to be able to do it ourselves.

JAY: So you're telling me that you were able to regulate the temperature of your body

at will?

RICE: With the nanite enhancement therapy, yes.

JAY: So you could be in freezing cold weather and be OK?

RICE: Absolutely. You could also redistribute oxygen throughout your body so that you can hold your breath for longer periods of time. You could cool off your body faster using the nanite enhancement therapies. You could regulate or change sleep patterns by altering certain hormones in your system so that you didn't have a need to get to sleep. It eventually catches up to you if that's gone on too long. Sleep deprivation is certainly one of the problems to avoid, is that the body--

JAY: Very prevalent in a war-like situation.

RICE: Right. Right.

JAY: So were there ever--did you ever witness any kind of cloning programs in the IDARF?

RICE: At the end of our training period, they told us that they'd notified our families that we were dead as a motivator to keep us going forward and to mess with our minds, basically. You have no choice but to continue on the course that you're on. And some of our families received clones that matched 100% from head to toe so that they would have a body to bury.

JAY: So you had a clone of you always there in case you needed it?

RICE: No. Not like that. It was more like they had all the measurements and the analytical information in order to do what they needed to do. They had our DNA on file if they needed to create a clone. And so the only clones that I was exposed to or familiar with, I learned about it when I was an instructor at the 333rd back at the FIG at the end of my career.

JAY: So you're in a battle, the nanites can help you to a certain degree. But if you got hit by a large-caliber weapon, what happens in the field when that happens? What's the procedure?

RICE: Well, the nanites also are able to close off blood circulation so that, if you did have a soldier that lost his arm, he wouldn't bleed out.

JAY: Well, that's good.

RICE: So it would shut off the blood capillaries to prevent loss of any more fluids.

And it took anywhere from 10 to 30 seconds for it to fully take effect. And those were part of the more autonomous features of some of the nanites. If you had a condition where a soldier was in extreme medical distress, then the nanites--one of the protocols is to put the soldier into a coma so that it would slow down all of their processes, and so that the chances of them surviving increase, so that they're no longer freaking out over the fact that they've lost multiple limbs, and there's blood everywhere.

JAY: And I think you said in a previous program, they could actually replace your arm.

RICE: Yeah, yeah. And grow it back. Grow it back through a advanced technology. The process that I went through was--it involved a submersion in a gel-like substance. And it involved, essentially, a 3D printing of--they had everything on file. So they knew everything down to the last capillary on my body, and so they were able to recreate it. The challenge was not in the recreation of the lost limbs. The challenge was in re-learning to use those, because even though the pathways are still connected to the same old pathways, there's still a transition that has to take in effect.

JAY: You have to learn motor control, and--

RICE: To learn motor control, yeah.

JAY: --gets funky.

RICE: Yeah.

JAY: Yeah. I've heard that before, by the way. So you're in the field. Do people actually die then?

RICE: Yes.

JAY: Soldiers actually die?

RICE: Soldiers die.

JAY: Something which is so traumatic that there's nothing they can do about it?

RICE: Mmm. For instance, after the KEW attack on Area 26, we had soldiers we never found. I mean, we found pieces.

JAY: KEW is?

RICE: The kinetic energy weapon.

JAY: Right.

RICE: The large meteor impact on the adjacent freshwater ocean. There were a number of soldiers that we found pieces of, and there were other soldiers that--just never found anything left of them. So yeah, there are soldiers that died during the process. And--

JAY: But I guess the ultimate goal is to make a soldier that avoids death, of course.

RICE: Sure. That avoids death, and has the best chances of surviving in the full range of adverse conditions, from cold weather, to hot weather, to--

JAY: Are there medical personnel among you when you're out in the field?

RICE: There are medical personnel among us in the form of--every soldier, as part of the training, receives a pretty extensive medical training. I don't remember any of the medical training itself, except to say that I went through it so that each soldier has the ability, and an equivalent training as a medic. So again, part of our mandate was for the training and coordination of the local populations. And it also meant that we were able to help those local populations with medical treatments.

JAY: Previously, you mentioned something called neural interface technologies. Could you explain what that is in more detail?

RICE: Sure. The neural interface technologies that we used was augmented by the nanite enhancement therapies. It allowed us a direct interaction with computer or software that had that connection ability.

JAY: What is it? What is neural interfacing?

RICE: It is control of either a weapon system, a guidance system, flight system, a drive through the mind instead of a direct joystick, or steering wheel, or something physical. And being able to control the interaction interface, the human machine interface through the mind, instead of having something physical.

JAY: Probably, they have this technology, I would say.

RICE: They do.

JAY: Quite useful, huh?

RICE: It is very useful. The neural interface technology was very specific in its guidelines on what, how, where could be controlled, so it wasn't what could conventionally be considered a mind-machine bond. It was more of an interface, if you will, to be able to control multiple things at one time. For instance, the pilots that were in charge of the shuttles were able to monitor, and either identify or target

certain things for the targeting officer, as well as flying the shuttle at the same time, as well as monitoring and keeping an eye on certain systems within the shuttle, and being able to tell whether or not there's crosswinds, or the temperatures, and making adjustments. Having the ability to remove the sometimes clumsy interfaces and allowing a person to directly neural interface with something cuts down the reaction time tremendously, and it also increases and improves the efficiency.

JAY: So you're saying the pilot can just say, rear gun, fire, and it'll happen?

RICE: If it's automated. Some of the targeting systems, he could call out or at least highlight certain things to the gunner so that--hey, pay attention over here. I see something happening on that side. And then highlight it. One of the things that I've seen just recently is DARPA coming out with neural interfaces for their soldiers, and that they're advertising this technology as something that's new when it's been around for a long time. They're just finally deciding to come out with it.

JAY: If they have this technology, you say they do--then, if anybody messed with the powers that be, couldn't they just release soldiers that have all this technology right here on Earth and take care of any situation if they wanted?

RICE: The oaths that were taken were based on upholding and following moral, ethical standards. And being deployed against a civilian population does not fall into that category.

JAY: So you never fought against civilian populations in IDARF?

RICE: We helped to manage some riots, but that didn't involve military technology being used in the application of suppressing civilians, no.

JAY: But theoretically, a group of military people here on Earth could have these super soldiers come against them, right?

RICE: They could. They could.

JAY: Do you think that happens?

RICE: I don't think it's going to happen simply because, number one, the biggest thing that we have going for us is the suppression of the technology. Having that come out in a big way like that would be a large opening into the disclosure picture.

JAY: Did you ever receive any advanced technology from extraterrestrials?

RICE: The extraterrestrials that we came in contact with IDARF were of a very specific technological advancement. You think somewhere around an equivalent

Earth, 1850s, just at the cusp of Industrial Revolution. So the technologies--with a couple of exceptions--that we came across were not in advance of what we had. Now, some of the things that I came across on Planet One, for instance, in which the civilizations there were using the planetary-produced voltage differential to create electricity, something similar to the Wardenclyffe Tower like Tesla had used, in which they were using the potential of the Earth, and the difference between that and the atmosphere, to generate an electricity. So having not seen that technology before our deployment to Planet One, for me, that was a new technology. However, it had been around since the turn of the century.

JAY: So they're using the Tesla technology to generate electricity?

RICE: They were. It was a DC form that they used for lighting and for a few other things. They hadn't really advanced it beyond being able to use it for light, or artificial light.

JAY: So would they set up a tower? A Wardenclyffe tower and start generating it, or what was the technology behind it?

RICE: They built it into their buildings.

JAY: Oh, they did.

RICE: So their dwellings, each of their dwellings. If you can imagine a circular yurt-like building, sometimes one story, sometimes three, with a conical roof that had a spire on top. Some of the spires had a built-in airflow system into it so that the normal differences in temperature and thermal variations within a building would cause the heat to rise and cold air to flow in. So they used it for cooling, as well as the spire on the top for part of the electrical generation.

JAY: But this technology you're talking about, this is Tesla. This is not ET technology.

RICE: No, these were ET technologies, the humanoid ETs that we came across on Planet One.

JAY: And they had perfected Tesla technology on their own?

RICE: They hadn't perfected it. They'd discovered it and had been using it. But then again, remember that their civilizations weren't driven by a need to invent and improve. Their civilizations were more of a, find something that works, and it's OK if it stays there. They were--

JAY: Kind of a steady state.

RICE: Steady state. Yeah, that's a great way of putting it.

JAY: What is some of the most amazing technology you saw when you were there in IDARF besides the scanners and all that?

RICE: Some of the really amazing technologies that just blew my mind, I think had to do with some of the force field technologies. The spacecraft that we came across and used. Just the sheer size of some of the crafts that were used as part of the SSP, just enormous.

JAY: How big?

RICE: Half a mile.

JAY: Half a mile?

RICE: Yeah.

JAY: Bill Tompkins says that he designed ships that were half to 1 mile wide. So do you think these are some of the designs that he was talking about, or are these more advanced, even?

RICE: The ones that I'm familiar with were a arrowhead shape as well as cigar shape. And then you have a myriad of other small shuttle craft depending on the mission.

JAY: So arrowhead shape would imply that you can fly through the atmosphere, and they're designing it for atmospheric flying as well as outer space?

RICE: Yes. The physical properties on the outside edges also are indicative of being able to use it within an atmosphere, because they were smooth, and were designed so as to cut down on the amount of friction and resistance.

JAY: How about underwater? Could they go underwater?

RICE: Of course. Oh yeah.

JAY: You can.

RICE: Yep.

JAY: And are there underwater bases here on Earth?

RICE: It's my understanding that there are.

JAY: How are these the big, giant ships powered? What's the power source for them?

RICE: A lot of the power sources that we regularly used were a Hall-effect-type antimatter in which an antimatter particle or particles were set in motion within a containment system. And the rotation of those around a circle would create a field. And then the field would then be capable of getting transferred into a conductor. And then the conductor is now producing electricity. Now, these were the type of power systems that can be miniaturized down to something the size of a cigarette pack, or as large as you need to. The Con PD gun that was the phase-destabilizing weapon had its own power system, because it was such a power hog. And that system in itself was about the size of a horizontal freezer. It was a pretty big one.

JAY: And these aren't nuclear powered, then, or anything like that?

RICE: The ones that I am experienced with are not nuclear powered. They do have them. However, when you don't need to mess around with something that's that deadly, and you can go with something that's deadly in a different way and doesn't cost you as much mass to be able to produce it. And all of the subsystems, and the safety systems, and the cooling systems, all of the other things that you need for a nuclear power generator, you don't have to have that if you're using--say, for instance--the antimatter.

JAY: They don't use fusion, then, fusion reactors at all in the Secret Space Program?

RICE: One of the reactors at the FIG base was a room-temperature fusion. And so part of the power that was used on that base was a pebble bed technology.

JAY: So they've already achieved fusion and just haven't told us.

RICE: Yeah. Yeah. They wanted to get through some of the fossil fuels on the planet.

JAY: Any other technologies that you saw that are being used today on Earth by us, have filtered their way down to us?

RICE: Oh, there's a bunch.

JAY: Yeah, like what?

RICE: There's a whole bunch of them. The gene therapies that you can see commonly is a child of some of the programs. Another technology, each soldier carried a med patch kit. And what it was is a 3-inches-wide by about 10-feet-long roll of second skin, if you will. It's rolled around a spray container that is about the size of an eyeglass cleaner sprayer bottle. It's not very large. But the whole kit comes as one, and you cut off as much of the patch that you need, put it to the wound, and it sticks on it, and then apply the spray. And the spray component activates the nanites and the genetic modifications to the patch so that it then covers up, closes off, and seals burns,

nicks, punctures, bullet wounds. And the process of the healing, the patch itself has a generic DNA as part of it. And so what it does is--kind of like the nanite enhancement therapies--it's supplied originally with a generic DNA sequence. Once it gets onto the soldier, it then uses the soldier's own DNA to replace the generic form so that the generic form is no longer the baseline, and there's zero chance of rejection. And so once it replicates that DNA sequence from the soldier, it's now no different than any other part of the skin, or the body, or a tissue that the soldier has. And so these were very, very helpful from a standpoint of, you've got a cut, or a scratch, or you've been shot, and then you can seal it up, seal it off, and go on about your business. This type of technology is being applied towards the second skin in the field of medicine today, in which they're using an analog derivative of a second skin, and which they're using for healing, for medical purposes.

JAY: So this is being used today?

RICE: It is starting to come out today.

JAY: Beginning of it, anyway.

RICE: Starting to see it.

JAY: How about technology that you saw that has filtered its way into us?

RICE: I'd say that there are a bunch that could be used here. The electrogravitic drive technologies. I'd sure like to have a Buick out in the driveway that had that. Having access to some of the advanced technologies as they relate to replicators. When you just have to store base elements in your home, and you don't have to go out and buy different products, or materials, or components. All you have to do is stock up on carbon, nitrogen, oxygen, different base elements, and that's all you need to be concerned with. And then--

JAY: The replicator, of course, is the machine that makes food, and products--

RICE: Products and food. Yeah, the next step in human evolution will be movement away from a centralized manufacturing process into a decentralized one in which people have the ability to manufacture things within their own homes.

JAY: Sure. We're almost there right now. 3D printers.

RICE: Yeah.

JAY: Well, Jason, it's been great to have you, and very interesting information.

RICE: Well, thank you for having me, Jay. It's all about disclosure.

JAY: Hope you enjoyed this. My name is Jay Weidner and you've been watching "Cosmic Disclosure."

Culture and Customs of a Distant World Season 1, Episo 28

Cosmic Disclosure; Culture and Customs of a Distant World
Season 12, Episode 28

JAY WEIDNER: Hey, everybody. I'm Jay Weidner. You're watching "Cosmic Disclosure." And we are back with Jason Rice. Hey, Jason. How you doing?

JASON RICE: Doing great, Jay. Thank you for having me.

JAY: Yeah, we're going to get into some interesting questions here today. What I'd like to know is--I guess we'll start on Planet One, the first planet you went to. What are like the social customs on the planet between sexes and between people? Are they similar to ours? Or are they different or what?

RICE: The social structure of the areas where people were--because it wasn't a single planetary government upon our arrival, each of their respective areas had their own customs and their own systems of belief and governance. So the areas that I'm familiar with--their method of governing was based on a guild clan system. So what that means is that for each of the different trades that they had, those trades would alternate through a position of who's in charge, basically, for that city or that region. And what it did was it allowed for sharing of that responsibility amongst the different groups. And so what you had was a natural balance in which one trade or guild wouldn't try to take advantage while they were in power. Because in less than the equivalent of a year, somebody else is going to be there. And so it allowed them to equally share amongst--what's the best for the community. And it worked out very well for the areas that we're in. So from a control standpoint and our governance standpoint, it was a rotating position that essentially they had established. Now, from a social structure, each of the families generally stayed along the same guild trade occupation. And what you ended up with is a family that--and that's the other thing is that families--when they were bonding, when they had a bond, what we would consider to be a marriage--although, they didn't call it that--that couple would move in with the bride's family. And so they had compounds in which it was a multi-generational association right there. And so people had their own private spaces, but they were all right there. They would have their space over here for those kids, space over here for those kids. And they would expand it if they needed to. But you ended up with multi-generational groups, usually within the same trade or the same guild that lived on the same property.

JAY: That's interesting that they would go with the bride's family.

RICE: I thought that same thing.

JAY: So is it matriarchal?

RICE: No, not necessarily. It was shared between both matriarch and patriarch. And so I think by going with the matriarchal family, it helped to encourage that sharing. Because it wasn't necessarily one over the other. Because there weren't any jobs or occupations that were blocked based on sex. And so you'd have women that were doing everything that the men were doing. And so it allowed them to keep a better balance, if you will.

JAY: So if you had a heavy-lifting guild, some guild like carpenters that lift big beams, the women would be right there with the men?

RICE: Mm-hmm. They would be right there with them.

JAY: And these are humanoids?

RICE: They were humanoids. They were a little smaller than in Western or European humanoids, probably on par with some of the size of a smaller Asian culture.

JAY: Southeast Asians? Yeah.

RICE: Yeah. So they were a little smaller. But proportionally, were--

JAY: Same?

RICE: --the same.

JAY: And they had sexes--two sexes?

RICE: Yep.

JAY: Did they fall in love with each other?

RICE: They did. And they also had a version of what we would consider to be arranged marriages. Now, commonly what comes to mind when you think of an arranged marriage is somebody is being forced to do something that they don't want to do. And that was not the case from what I experienced or saw on Planet One in that, yes, they were arranged. Because you had certain families that wanted to improve the reach or the bond with another family. But ultimately, it came down to veto power of the individuals. So if they said no way, then it wasn't happening.

JAY: So if you had a guild of--I don't know--auto mechanics. And the girl, the young woman, brings a man in from the outside into the family, which is the custom, is he also an auto mechanic, or a carpenter, or whatever the guild is? Or does he learn that guild?

RICE: Not necessarily. Part of the education system that they have involves a creche type in which children will learn from their own family the trades that they are involved with. But then what they would also do is they wouldn't spend all of their formative years just learning that one thing. They would rotate. And it did several things. It allowed for a sharing of their responsibilities, so that one person wasn't always responsible for educating a child. It ended up allowing them to have children that rotated through different trades, and so that they could focus on things that they really enjoyed and were good at. And through experiencing those things, they were able to get the exposure to find out, hey, I never thought I was a good fisherman until I went over to Joe's place. And guess what? Now, I'm a good fisherman.

JAY: So the educational system was really having the kids move around through the guilds learning the different skill sets?

RICE: Yes.

JAY: Gotcha.

RICE: Yes. And it also provided them with backup. In case the event of illness or death, they had people that were trained in doing all the basics of the various guilds, so that they could then say, OK, hey, we need somebody to come help out with X. And then they'd have people that had all gone through training in how to do whatever that was.

JAY: And then marriage? Was there a marriage ceremony?

RICE: There was a bonding ceremony. They didn't go down to the justice of the peace and sign documents. They had a ceremony in which they signified the bonding of the two families.

JAY: Was there any interactions between the different groups on a formal basis?

RICE: There were. There were some outlying villages that because of their size or because of their isolation didn't have as developed a social network system as some of the larger cities like Area 26. So some of the outlying villages may have had four or five families, instead of 4 or 500, or 1,000 families. And so you would have shared resources in which, OK, they wanted to take their goods and services into the big city and then trade for supplies, or materials, or whatever it was that they couldn't manufacture, or make, or produce, or find themselves. On Planet One, they hadn't known conflict or war for generations. They had one area on the planet that there were weapons that were still being manufactured and more of a hobby than anything else.

JAY: Were there hospitals or any kind of medical staff available for the people? Or

did they just take care of themselves?

RICE: There was a shaman-like guild that was in charge of taking care of growing herbs, spices, things that they used for medicinal purposes. So the large cities had these particular guilds spread out in key areas, so that the people were able to best benefit from those skills.

JAY: So if you broke your arm, where would you go?

RICE: You'd go down to the equivalent of a clinic on a street corner. Because the families lived on the same compound where they had their businesses, their guilds, their trades. So you would go to the trade that was the medical trade.

JAY: Right. Were there books? Do they read?

RICE: They had books. They had their own written language. They had their own developed art. In fact, all throughout the city, Area 26, there was art. Because the city was built with a very extensive canal system similar to what you would see in modern Holland, in which they had a combination of small roadways where it was large enough to push a cart or to walk. And then next to it was a canal. And so the bulkier, heavier, larger shipments of goods and material was done on the canal, because it was a lot easier to move things around on a boat.

JAY: Do they use work animals?

RICE: No.

JAY: No work animals?

RICE: No work animals.

JAY: So how did they move their carts around?

RICE: They pushed them.

JAY: They pushed them?

RICE: Mm-hmm.

JAY: So it's a pretty low-level technology here on this planet.

RICE: It was, not including the artificial light source. But yeah, they were more interested in their daily day-to-day activities than they were in progressing or improving their technologies.

JAY: What do they do for entertainment?

RICE: They had games that they played, an equivalent of Kick the Can, or throwing a ball through a hoop, or even something very similar to checkers, strangely enough. So I mean, everything from singing to they had some musical instruments.

JAY: What kind of musical instrument?

RICE: One of them was very similar to a lute-guitar. Another one that drums. I don't think you can find any civilization that doesn't have some kind of drum. They had their own.

JAY: Were they good? Were their musicians really good?

RICE: The ones that I heard--yeah. Yeah, the developed and mature guilds, that they were--they'd studied, and practiced, and worked on everything from art. Some of the guilds were dedicated to music.

JAY: So if I was born into a carpenter's guild, but I really wanted to play the lute, was I stuck being a carpenter or could I go to another guild?

RICE: No. There was a number of instances where the interplay like that was allowed. If the family was not able to give up those extra hands, then they would work to finding a replacement. And that's usually where arranged relationships came into play.

JAY: I see. I got you now.

RICE: So it wasn't, no, you can't do it, because we need you here on the farm. It was, OK, well--they would work together to find a solution on how to make that happen. Because part of their culture was the pursuit of the individual's skills along with what they liked doing.

JAY: Was there any kind of confrontation between different kinds of people? Is there any kind of clan rivalry going on?

RICE: The last time something like that had occurred was three generations before our arrival. So they had lived peacefully and cooperatively for a long time before we got there, before the invasion.

JAY: How about law enforcement, jails, courts, prosecutors, lawyers?

RICE: No, none of that nonsense.

JAY: What if I broke a law? What would happen to me?

RICE: The people that broke laws--the consequences of such were a group decision by the governing council, if you will. Each of the trade unions or the clans, the guilds had representatives. So each guild was a microcosm of the larger city. So within each guild, you have, again, leadership positions that rotate. And so you have a governing council, if you will, of each of the guilds. And that governing council meets together with other governing councils. And so if someone broke a law--or there was no need to steal something. Because if you needed it, you made something that you were familiar with how to make. And then you found somebody that was willing to trade.

JAY: And what about crimes of passion?

RICE: They may have existed. I was not aware of any during our times there. That changed as the war came and developed. And over the period of the war, they--when we first arrived--had an alcohol--one alcoholic drink. And it was like a fermented wine of sorts. By the time the war had ended--because of the interactions with Earth humans and the knowledge that was brought with Earth humans about distillation and additional fermentation, they ended up having a larger variety. Because the Earth forces that were there wanted to have that. And of course, they got interested and, oh, wow, this is another alcoholic beverage.

JAY: Did alcoholism begin then?

RICE: When I left, it had not, simply, I think, because of the fact that it comes down to brutal simplicity. Those that are able to move and fight were required to fight. And that doesn't leave much time for--

JAY: For partying.

RICE: --partying or extracurricular activities.

JAY: Did they have any kind of drug problems?

RICE: No. This planet did have its own marijuana analog that was used during ceremonial events.

JAY: I was just going to get at that. Do they have any psychedelic plants? Anything like that they would use?

RICE: The marijuana analog that they used on Planet One was mildly hallucinogenic. And its uses were limited to spiritual ceremonies. And as far as any other drugs that--I didn't come across any others that they had used. That was the only one.

JAY: Did you witness any of their spiritual ceremonies?

RICE: I was able to witness a bonding ceremony. And once the invasion began, a lot of that had to take a backseat, because of the preparations to clean up.

JAY: What have you learned from being with this other civilization that you think we can draw from here on Earth? Is there anything?

RICE: Oh, there's a bunch of things.

JAY: Yeah? Like what?

RICE: Like we don't need a fiat currency system.

JAY: They do not have a currency?

RICE: They did not have a currency system. Their currency were their products, goods, and their time.

JAY: Interesting. So then they would never--

RICE: Native Americans didn't use it for how many thousands of years? They didn't have a fiat currency system. Currency is established as a means to organize and coordinate the distribution and use of resources. That's the only reason for a currency. And if you have an alternative to a fiat currency system, then the fiat currency system is pointless.

JAY: So just barter and trade? That's how they governed?

RICE: That was how they did it.

JAY: Any other things that they have that we should be doing?

RICE: I think the integration of a geo-power system into each home is also a fantastic thing that--hey, who wouldn't like to have a elimination of their power though.

JAY: Every single house on this planet had its own power source?

RICE: At least one of the buildings on each of the family compounds. Yes.

JAY: So you say that they're a civilization that's a little bit backwards from us, maybe like a hundred years ago or so.

RICE: Sure.

JAY: But we had rudimentary electricity a hundred years ago in the United States, but we didn't use it for much at the time, outside of lighting, and running the radios, and

all that. What do they use their power system for? How did they use it? And why didn't they invent stuff that would help them push the carts and things?

RICE: Sure. And that's a great question. Why didn't they develop higher technology, more advanced technology? And when I asked them this question, they didn't see a need to. They used the electricity for artificial light within the main dwelling on each of their property or compound. And from that point, for me, they cooked with fire. They had something very similar to a wood-burning stove. If they needed to put something in an oven, which they did bake things, they had a Dutch oven that they would use with a wood-burning stove. The whole alien aspect of this is that they don't think like we do. Humanity looks at technology as, OK, where's the next great thing? How can we improve on and change XY and Z to come up with a better mousetrap? Their philosophy was based on the day-to-day activities and putting as much of themselves into that, rather than trying to change it.

JAY: Did you ever witness any type of slavery or coercion of another person to do labor for free on this planet?

RICE: On Planet One, or Planet Two, Calidus Three--no. The only experience that I had where there was something close to forced labor was on Planet Three. Planet Three was the only place that had an organized crime element. Planet One, or Planet Two, Calidus Three--neither of those had any forced labor instances or examples that I'd see.

JAY: The famous anthropologist, Margaret Mead, pointed out that anytime that Western civilization, whether it be troops, or doctors, or whatever would come into a non-developed country, that presence, just the presence alone would change that culture usually for the worse. That must have happened--

RICE: Of course.

JAY: --on these planets. What happened after you guys were there? What kind of effects did you have?

RICE: Well, we weren't on planet as long as we had hoped to be before the invasion started. The operation plan called for 12 to 18 months of intel gathering, of getting familiar with the local operators, the local people, inserting ourselves into those societies, so that we could develop positive relationships with them. So that period of preparation--we weren't allowed to finish, because the invasion came early. The long-term effects on those societies were absolutely devastating. No doubt about it.

JAY: In what way?

RICE: Well, for the larger cities where there were thousands of people already, we

would see them as being more open to alternatives, because they had more examples of culture. The small villages that were out in the middle of nowhere, where there was only four or five families and their life on a daily basis was all about survival and continuing on with children and grandchildren. They had their own version of art and the expression of that. But it was different than a large--one of the larger population centers. What kind of effects did it have?

JAY: Well, the war must have had certainly a large effect.

RICE: It had a tremendous effect on the people themselves. Exposure to that kind of devastation, and destruction, and death changes a civilization. And theirs was no exception from that. When the war came, what happened is that we started bringing in people from the remote villages, because they were completely exposed for one thing. And there was no way that they could defend themselves. And so another aspect of that was that we needed to have full participation of all the peoples, so that we could mount a defense against the invasion. And so in a certain respect, most of the villages were willing to come in. I didn't come across any villages that openly fought it. But there were villages and locations in which people didn't want to leave. They didn't care.

JAY: Did you ever do anything that you regretted to those people?

RICE: No.

JAY: You didn't?

RICE: Hmm-mm.

JAY: Do you know anybody that did things?

RICE: I would say that--let me amend that. Looking back, wishing that I could have helped more certainly falls into that category--

JAY: Sure.

RICE: --in that, do I wish that their civilization and their culture didn't have to become homogenized as a need for fighting the war? Yeah, certainly.

JAY: What were the effects of this homogenation?

RICE: Elimination of certain cultures.

JAY: And probably skills, too.

RICE: Skill sets.

JAY: Did you guys introduce high technology into this situation?

RICE: On Planet One when we left that deployment, I was not able to participate in the rebuilding efforts of Planet One after the war was over. So I can't answer it for that one. For Planet Two--and again, all the way through the wars for Planet One and Planet Two, the whole concept was we don't want to use our advanced technology, because we don't want to poison them, which turned out to be an absolute propaganda. Because when I went back to Calidus Three to help with the rebuilding efforts in the 30 or so months that I was gone, it had transformed from, no, we don't want to poison their civilization with too much technology. Transform from that to, how quickly and how much can we grow this civilization into a spacefaring society? It was a 180-degree change. And I'm convinced that that was the intent all along, again, playing into, how do we force every person on the planet to buy in and consent to whatever it is that we're requiring? Well, by killing off a lot of people and forcing them to--in order to survive, having to give in to certain things. And part of that plan was the limitation of technology, because that would have saved more lives. So the command structure didn't allow us to use that and saying all the whole time--lying that it was because they didn't want to poison the civilization. No, it's they wanted to control how much and how many people were lost. And so once the war was over and I went back to help with the rebuilding efforts, it was open season. I helped with the establishment of one of their orbital platforms, one of their first orbital cities. So you go from holding back and withholding advanced technologies to, let's help you develop as quickly as you can which, of course, is going to destroy any of the society and civilization culture that they had.

JAY: Was that the point?

RICE: Yeah.

JAY: That's the point.

RICE: That was the point.

JAY: The whole point was actually to ruin their society.

RICE: To bring it into a single-ruled, one government system in which overall control could be wielded against.

JAY: So essentially, when you arrived at these planets, you brought the entire future to them immediately. They didn't have any chance to progress like we do. They just got everything at once, and that had to be psychologically debilitating.

RICE: Of course. I mean, suddenly there are seedy establishments.

JAY: Prostitution?

RICE: Yeah.

JAY: Really?

RICE: Yeah. They had progressed to a point where that was one of the businesses that had developed.

JAY: Was there any unusual family arrangements that you witnessed on any other planets?

RICE: That's a great question, Jay. On Calidus Three, the social structure of each of their families were such that you would have anywhere from one couple to four couples that were considered a family. And so it wasn't like conventional polygamy as we would see it. Because each person--an individual was considered to be equal. And so you would have, say, three couples in which the male part of couple one considered himself to be bonded with or in our terms married to the individuals of couple two and three. Now, these weren't the sexual relationship such that it was only a heterosexual relationship. But the bonding of those couples were such that they considered all of the individuals to be their--what we call a husband or a wife. And so it--

JAY: And what would be the advantage of this?

RICE: The advantages that I saw was that they were able to really take the--it takes a village to raise a family to the next level in the sense that all of the individuals were involved, even if only one couple had kids.

JAY: I gotcha. All the kids had multiple parents.

RICE: Yeah--had multiple parents with multiple careers or varying degrees of--and this is what they do for their living. And so, yes, they had that support structure.

JAY: Is there anything on Earth that's taboo, that's accepted by any of these other cultures, like something here that we would not allow that they were OK with?

RICE: I think some of the child labor that they encouraged and fostered. Many in Western civilization would look at as--that's child labor slavery. Don't do that. Well, part of their culture was training the kids. Now, they cared for them. They didn't want to endanger them. So if it involves getting up to the top of a mast on a sailing ship so that they could fix something up there, that's not something you send a kid to do. But I think perhaps that's one of the things that would be looked down upon.

JAY: But if you looked at rural America a hundred years ago, I think--

RICE: Oh, yeah.

JAY: --those children today--we would say that was running those kids ragged--

RICE: Sure.

JAY: --6:00 in the morning till late at night, working on the farm. Very famous for that. And so it depends on your culture and where you're at. So if you're a rural culture, you're going to be working a lot.

RICE: Yes.

JAY: If you're an urban culture, not so much.

RICE: Yep.

JAY: So they never sent the kids off to school or anything like that.

RICE: On Planet One, the school for children was the process of rotating through the different guilds and learning the trades. They had established academics, if you want to call it that--those that knew the written language and could read some of their ancestors' written languages.

JAY: So there were scholars. And there were college--something like a higher institution for people who had known abilities to--

RICE: No, actually, there wasn't. Any of the higher education would have come from the academics, the scholar's guild.

JAY: I see.

RICE: And so philosophy, or history, or--

JAY: Art.

RICE: --art is included or sub-categories of that.

JAY: Was there more than one language or was there just one language?

RICE: There was more than one language--the Area 26 that I spent a large amount of time in. There were also some remote villages relatively close to Area 26. During the consolidation phase, opening phases of the war, we redeployed to certain arctic areas to try and help with the relocation of people from those areas to defensible positions,

so that they could be protected as much as we could. They had different languages there.

JAY: Besides being aware of you, are these people on these other planets aware that there is this whole galaxy of beings around them?

RICE: Before our arrival?

JAY: Yeah.

RICE: No.

JAY: They're just isolated?

RICE: Isolated. Adopted--their sun, or moon, or wind gods were the ones.

JAY: What's your takeaway from interacting with these other civilizations? What would you like us to learn from them?

RICE: I would say that preservation of a culture requires certain boundaries. And that's not bad. If you go on the premise that we are but a thought that occurs in the mind of God, in which this is an opportunity for God to experience himself and experience life in the many, many, many multitudes that exist, having separate cultures allows for that expression. Because if you end up with the same cookie-cut experience every time, you're not getting a varied experience. You're having the same experience a thousand times, instead of a thousand experiences. I would say, Jay, that my takeaway from my own experience is that preserving the unique cultures may require having boundaries. And whether those are physical or figurative boundaries--there's nothing wrong with that.

JAY: Thanks, Jason, for being on the show.

RICE: And thank you, Jay, for having me. As you know, this is all about full disclosure.

JAY: It is. And I'm Jay Weidner. And you've been watching "Cosmic Disclosure."

Hidden ET Civilizations Season 12, Episode 29

Cosmic Disclosure; Hidden ET Civilizations Season 12, Episode 29

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith. We've heard of ET civilizations living on Earth in our ancient past. But is it possible there are ET civilizations living underground or some hidden areas on Earth this very moment? Welcome back to "Cosmic Disclosure" Emery Smith. Emery, this is exciting.

EMERY SMITH: It is. And it's something that needs to be brought to the world's attention, because we have amongst us ETs living not only on terrestrial land but underneath the Earth. There are civilizations that have been here for a very long time that have thrived and still stay here, and work in conjunction with some human people and sometimes not. It depends on the different civilization that you're referring to.

NOORY: What are they doing here?

SMITH: Well, they've been here for a long time. They've been here before we were here, before we actually started up and started building buildings and populating the Earth. And they have their own--it's like their own home, just like what are we doing here? It's our home. We consider planet Earth our home, 28 and they have their own home, too. And there's different types of biospheres that are located all around the planet inside deep within the Earth that have their own atmospheres, and have their own bioluminescent technologies, and can grow their own food. And also, you have to understand they're a little bit more higher tech than we are. So they have their own portal travel system where they can go amongst the stars and other planets and things like this. They're not driving around in cars, that's for sure.

NOORY: These ET civilizations, how many are there down under?

SMITH: I'm only aware of about four of these ET civilizations that I have been exposed to, I'll say, that are living amongst us in underground facilities that they have created that are not our facilities. And some of these are craft that have been teletransported into different parts of the Earth, and different parts of the mountain ranges, and things like this. And of course, a lot of these are located on national parks and things like this and in very desolate areas like the bottom of the oceans, and Antarctica, and things like this.

NOORY: My gosh. How many are we talking about in terms of the entities? Thousands? Millions? How any--

SMITH: Yeah. There's over probably a few million that I'm aware of that are

constantly coming and going though. You have to understand these extraterrestrials that have been here for a very, very long time are going back and forth and trying to help with information. And they're not here to really intervene with us. But they are here to protect the Earth. And they are here to help the Earth in case something happens when like cataclysmic events happen. It's very interesting when there is a tsunami, there's so many UFO reportings.

NOORY: Sure.

SMITH: It's always interesting when a volcano erupts. People start reporting UFOs at a higher percentage than would normally happen.

NOORY: But the tsunami still occurs. The volcano still erupts. It's not like they put a thumb down it and stop it. Why don't they get involved with it?

SMITH: Well, they do. It could have been a lot worse, I'll just say. So they do work on--they have special physics, and energies, and sciences that we don't understand yet that can help the Earth heal itself and actually mend these cracks under the oceans and things like that that would be a catastrophe for all of us.

NOORY: And we have these four types that you say are living on this planet. What do they look like?

SMITH: Well, one is a reptilian race that's been here for quite a while. And there's many different kinds of reptilians, by the way. And people come to me actually look at this as, oh, well, this is the evil demonic race of this, this, and this. And you have to understand it's just like humans. When I say someone looks like someone from the ocean, there's many different versions of that. It's like well, how many--you know, what do humans look like? And then if you were to ask me that, well, look how many different races there are of humans.

NOORY: Oh my God. Absolutely.

SMITH: And it's the same thing with extraterrestrials, whether they're the tall whites or the smaller--

NOORY: The little alien grays with the little black eyes.

SMITH: Right. Exactly.

NOORY: I think they're robots, by the way.

SMITH: Those are. Those are programmed lifeforms. You're absolutely right those have been designed not only by us but by other extraterrestrial civilizations to carry

out special missions and to also visit Earth and check on things, just do some recon, or take some DNA from the animals so in case something does happen they have a storage of this, because you wouldn't want to send yourself there. You'd rather send your cyborg self there to do it--

NOORY: First.

SMITH: --because they're not wanted here. And we have to be understand that since they are not wanted here by some of these government states that they're going to die. And they're going to get killed. And that's why a lot of these beings that are captured self-destruct or they'll put it them in containers that they instantly melt down to liquid. And this is just because they're not real.

NOORY: Well, do all governments know and are they aware of the fact that they're here? You know through the programs you've been in.

SMITH: Yes, the government--

NOORY: But how many groups knows this?

SMITH: Oh no. All the countries pretty much know this. I mean, if you go and look back at all of the amazing files that just recently within the last decade, all countries have released their UFO files. And it's like one of the biggest stories, but no one talks about it. You know, no one even mentions these on documentaries at all. Of course, my colleagues that are in this community and your colleagues, they know and they've studied this. But there's been one country that will not release the documents.

NOORY: Hello.

SMITH: And why is that?

NOORY: It a good point. You mentioned that they walk among us. Do they shape shift? I mean, how do they blend in?

SMITH: Well, no, I mean they're human, like I said.

NOORY: Some of them.

SMITH: They have human DNA. But there are these types of shape shifters. And they can change into anything. They can make themself look like an animal. They can make themselves look like any type of ET race. They have the ability to change their atomic structure into almost anything, kind of like you see the--

NOORY: Oh, they're like chameleons?

SMITH: Yeah. They're like chameleons.

NOORY: They have that ability.

SMITH: But these are very highly evolved light beings by the way. They're not here in a malevolent way. They're not like us. They're completely different than we are. They only do things to serve humanity, and to serve the universe, and to serve the planets and things like this.

NOORY: So Emery, you've mentioned the reptilian race. And you've mentioned that there's a race that looks somewhat human. What about the other two?

SMITH: Well, there's like ones that live in the ocean. And they've been there, I think, probably the longest.

NOORY: Aquatic ETs, basically?

SMITH: Very aquatic ETs. They don't come to the surface because they cannot handle too much light. They're very sensitive to light. And they have very large eyes. And they have a very bluish white body. Some have gray bodies. Some have a black color body. And they are anywhere from three to seven feet tall. They have webbed types of feet that are not jointed at the ankles, kind of like a little like a little flipper. They have this beautiful fin though that covers their arms that are not very long. It's a membrane that sticks out like a fin. But it moves very fluidly.

NOORY: Where do they come from? I mean are these earthbound creatures? Were they always here?

SMITH: Oh, we call these--the ones that live in the water, we call them the Aquifarians. And we do believe they came from another water planet and that they have the ability to also have teletransportation and things like this. But they also have a lower mindset. But even though they're very high conscious, they're very simple creatures.

NOORY: Well, how did they get here, in craft of some type?

SMITH: Well, I don't know how they got here. Alls I know is they are here. And we are monitoring them. And we've been monitoring them for some time. And I even heard that one of these creatures was actually found by the military. And I saw the pictures and the videos of these beings. But in the databases, there is a huge amount of this information about this race. And we're not interfering with them. We're treating it more of like a biology thing where we're just watching them, and studying them, and trying to understand, like you say, where they're coming from. We do have their DNA.

NOORY: But they're intelligent. Rather than being more fishlike, they're more humanlike.

SMITH: Well, no. That's what I'm saying. They're not as--the intelligence, from what we have gathered, is obviously they're intelligent, but they're simple.

NOORY: How did we come across them? Did we just stumble across them? Was there some program?

SMITH: Well, no. We had created our own types of submarines that were reverse engineered from extraterrestrial craft that can form their own energetic density field of magnetic flux field around these types of craft that can go into very, very deep, deep waters, deeper than what you see at "National Geographic" and these other--

NOORY: Deeper than our traditional submarines.

SMITH: Than our traditional submarines. And they also have drones that can go very, very deep and run on their own for weeks at a time, and then come back and report. And we can see all the recordings. And we can see the data that has collected in many different wavelengths of light that we can't see with our own eyes. These supernatural cameras that they have on these craft can record in complete darkness for a very long distance. And things are now evolving to come out to the public, like people are now having their own submarines. And other organizations are now traveling to the depths. And they're starting to see things. They're starting to see gigantic sharks. They're starting to see fish that are transparent that you can see their brain, you know things like this, which is amazing. I mean, the stuff they're showing is going to really open the eyes for the general public to realize that we are not the only ones when we're just discovering new creatures and fish every day.

NOORY: Are these ETs friendly or is there a potential problem?

SMITH: As far as I'm concerned and far as my experience with this, they're very, very friendly.

NOORY: All of them?

SMITH: Well, the ones that I've worked with--

NOORY: OK.

SMITH: --OK? There's a very big possibility, of course. The universe is large, you know. I know of one horrible, horrible ET race that is not very nice.

NOORY: What do they do? The horrible ones.

SMITH: It's the earthlings. You know, we are the ones--

NOORY: Us. You think we're the bad ones.

SMITH: Yeah, we are the bad ones. If we're not taking care of each other or not taking care of the planet, and we're chopping each other's heads off, that's not a normal conscious thing to do. And to fight over something, and to mislead young people into going into a war to think they're fighting for something, and having them on the front line, and having them killed off for a corporation to make money is wrong.

NOORY: Well, do these ETs, Emery, think there's something wrong with us, because you're absolutely right. We are a warring group of people on this planet These ETs, if they're benevolent, must come here and see this and say, what's wrong with these things? What's wrong with these creatures?

SMITH: That's exactly what they're doing. And that's why they care so much. You know, these groups of ETs that are monitoring the planet, that are monitoring us, making sure that we don't blow up the planet. You know, one nuclear bomb goes off, and it's really going to destroy the entire planet, just one of them. And that's why they're creating bombs now that can do as much damage as a nuclear bomb with no radiation, which is very scary. There are other planets out there that started like we did. And you know back in 1899 with Tesla Stubblefield where they created free energy already, and the corporations came down hard on them.

NOORY: They couldn't make money on it.

SMITH: Right. So for the last over 100 years now, we are--been suppressed. We've actually could have--imagine if back then we had anti-gravity and free energy how beautiful and how clean this planet would look today and how maybe the differences between different races and countries would not be such an issue. I think science and the new physics that are coming out and the new sciences that are coming out are going to bring together, I think, the countries in a more peaceful environment. And also raising the consciousness of the planet is very important. And I think the ETs are actually doing this. I think the universe has energy that showers down upon us that allows us to elevate ourselves into a new state of consciousness every second. And you can see it in the children that are born today. They're just amazing. They're more intelligent. They're more compassionate.

NOORY: They're caring.

SMITH: They're caring. And it's important for the families of these children to support this positivity and not alienate anyone.

NOORY: Why are we the dominant force on this planet? You would think these ETs would take over. How come?

SMITH: Well, like I said, they're not warmongering like we are. What do we have that they need? Nothing they can create anything they want. They can go anywhere they want. So they can just hang out and vacation.

NOORY: Why don't we go into war with them? Why don't we take them all out?

SMITH: Well, we've tried to.

NOORY: Oh, we have? What happened?

SMITH: We tried to get some sarin gas in there. And that backfired. And many people were--many military guys--

NOORY: It backfired on us?

SMITH: --were killed. And they had gained a lot of technology from these ant people.

NOORY: The Hopi Indians talked about ant people. Are we talking about the same thing here?

SMITH: Yes. Yeah. I mean the Hopi Indians and all the tribes out there, including the Zia Pueblo tribes--there's so many tribes up in New Mexico and southern Colorado that have reported these things. They have history--actually kept history of this in the writings and, of course, on the rocks depicting of these people.

NOORY: Did they look like ants? Big ants?

SMITH: Yeah. They're segmented, but they--

NOORY: Creepy.

SMITH: --but they do have arms. And they do have a face like we do, but it is in the shape--

NOORY: Big heads.

SMITH: You know. They're very large. They have an skeleton. 387 And that's what supports them. They don't have bones. I'm not sure exactly what it's made of, but their exoskeleton like an ant has. And they're, of course, very smart, very industrious. And they have huge tunnel systems out in southwest of the United States and over in the Gobi Desert. And they have technology too. And they've been around for quite a while. There's also word that they were once on Mars. And so that was a second-hand

information that I heard through other colleagues and reading about some certain things. But yes, they are there. They're here now. They're still here. We tried to attack them and get them out. And I think because our government, with the advent of new ground-penetrating radar, has now seen what's living down there. And they want the technology they have.

NOORY: Do we want them out, like off the planet?

SMITH: No. No. They're not creating any havoc. They're not destroying anything. It's more of get in there and I want something that you have, like we do with war. You know, it's this whole--

NOORY: And where do they live, the ant people specifically?

SMITH: Specifically, in the southwest region of the United States.

NOORY: In mountains or where?

SMITH: Underground. I mean, of course, the Great Sand Dunes. There's a huge facility there by Blanca Peak there and Crestone is the big one. But it tunnels way down deeper. And they have their own transportation system that they're using to get from here to there. And they have already developed teletransportation, things like this.

NOORY: I find this utterly fascinating. And you know Admiral Byrd claims that he went into a hollow earth and he saw all kinds of creatures.

SMITH: Yes.

NOORY: Might we be talking about creatures one and the same that he saw?

SMITH: It's possible. But there is an inner earth. There are huge areas of pockets in the Earth that--and pockets in the water and underground aquifers that are homes to amazing amount of creatures that somehow get lost and end up on terrestrial earth and are seen in the woods, things like Bigfoot, and then call in and say we see these creatures, and it looked like this, or it looked like that, or something flying that was just too big to be a bird. And sometimes these things do escape from these--not escape but accidentally come to the surface. And I think a lot of sightings of paranormal things that are around the planet are actually just these creatures that have emerged from caves or have accidentally teletransported to an area on the planet that they're being witnessed. And we are just coming up with names for them, which could be anything, like I said.

NOORY: Sure. Why aren't some of these entities living on top of the surface? Why

are they underground?

SMITH: Oh, they are. There's many entities that are walking amongst us, and studying us, and working with us, just like we're working together right here right now.

NOORY: Are you one of them?

SMITH: No, I'm not. I'll say this. We all have ET genetics in us. And some of us have more extraterrestrial genetics than others. And until they release the extraterrestrial genetic database that I helped create, then people are going to--people are going to see, oh, well, I have more of this race than that race. And we're not just a human race. Don't forget like when we do testing of non-earth origin specimens, they have human DNA too. They're part human. So I think the best way to put this for everyone is I think everyone has extraterrestrial DNA. And everyone has a percentage that they are more or less extraterrestrial.

NOORY: What did you do, Emery, for the ET database?

SMITH: As I was taking samples from these beings, later on I got a little bit higher clearance. They were allowing me to look at different types of ways to categorize these beings and categorizing the DNA. And I helped write that out what that was. And they were wondering how are we going to put this in a program like an app, kind of like an app that we could share with other underground facilities.

NOORY: Sure.

SMITH: So I was part of that process. It wasn't just me. It was a huge group of people, about 20 of us, that were working on getting a way to store this in a safe way off of Earth, by the way, on a type of satellite I'll say, but still have access to it without using radio frequency or the internet, because all that can be hacked. Even back then they knew that. And this is a time where you have to understand we're talking like MS DOS times, where the type of technology that they were building it off of, they actually wanted it to be old and not futuristic, because they knew the more futuristic we got with the technologies for building databases, that it would be harder for hackers to relearn the old stuff. So I was part of basically categorizing that and helping the programmers put it in a format and writing these smaller programs to keep it encrypted and also to help keep that database updated and work with other facilities from around the planet that needed to do the same thing, because if there was some sort of catastrophic event and we lost all the data, that would not be good for us for our evolution, because we need this data to help evolve ourselves.

NOORY: How much technology do we get from them?

SMITH: Pretty much all of the technology we have--

NOORY: Really?

SMITH: --today is from outer space. All these things are just things that they have either given us, crashed here on purpose so we would figure it out, or actually side by side in the projects telling us this is something you can design, and it could be safe and be used for this, that, or the other.

NOORY: Interesting take. You had mentioned, of course, that governments know about them. And if governments know about them, I have to assume big business knows about them. corporations, reversed engineering, stealing ideas--they've got to be all involved in this.

SMITH: Well, like Colonel Corso said, they were--after the four crashes here in Roswell and in San Antonio, Texas, and other parts of New Mexico when we were shooting them down with different frequency devices, the first thing they did was gather up all the parts and all the equipment. And they cataloged everything--the military now. We're talking about the Army and the Air Force later on. And they would then give it to--they would go out and find the best technicians, the best people in all of the science community and the universe that were good with circuitry and good with things that had a right mindset that could handle looking at something and not like freaking out and trying to say what is this and how does it work. So Corso went out. That was his job. The general gave him that job to go out and find these few hundred amazing people that were conscious and that were very intelligent by the way, and say, hey, figure this out.

NOORY: Duplicate it.

SMITH: Right. Duplicate it. And we're going to give you money to do it. And that's where the secret corporations were involved. They started figuring this out. They started making a lot of money. But the deal was that, once they figured it out, they have to give it back to the government. And that's where everything went to--

NOORY: We think they gave it back.

SMITH: Well, that's what was supposed to happen. But according to Corso and others, that's not what happened. They kept on to it. And if they did get something back, they wouldn't give them all the information to that. And so the corporations became, of course, these mega corporations that now control the planet because they have a higher tech than we do and probably their own military type thing. And that's why we're here today. And that's why, I think it was Eisenhower who said before he retired said--

NOORY: The industrial military complex.

SMITH: --be careful of the military industrial complex. So I mean, why doesn't people respond to this? This is a very dangerous thing that's still happening today and that needs to be looked at. They try to keep us looking at, of course, the media and things like this to make sure we don't really talk about what we're talking about right now. And that's a problem that I disagree with the corporations about over unity devices and cures that they have found out that they can make with frequencies. And in the future it is coming. It's just they're slowly releasing it too slow. And we don't need to do that right now. We need to--excuse me. We need to do it today.

NOORY: Do you sleep easier knowing these ETs are here on this planet doing what they're doing?

SMITH: I personally don't believe I would still be here if it wasn't for extraterrestrial intervention and intervention from certain government organizations that do have a feeling of what the future could come to. And there is a--how I feel, a very protective light upon all of us, not just myself.

NOORY: Well, what do you mean you wouldn't be here if it wasn't for them?

SMITH: Well, I just think I have a lot of protection from these extraterrestrials. I think they're looking out for me.

NOORY: You mean somebody could be out to get you?

SMITH: Well, I mean it's been already proven in the past that I've been attacked many times, 614 you know physically and energetically. And I think that there was some interference to allow me to be here today to express the truth and knowledge of all the things that are out there.

NOORY: How do you think this all plays out in the future? What's it look like for the ETs? What's it look like for us?

SMITH: There's going to be some hard times. There's going to be some catastrophes. And that's OK, because it's already happened. I mean, we've already been through so much as humans. And we have to look at where are we going with that. And we are. We are getting more evolved, definitely technically advanced more ever since I've come out. The--the corporation's been releasing amazing materials and things that I talk about on the shows, because they're like, it's out now. It's already open. So now they're actually fighting over who is going to get it. And this is going to be things that are going to help us survive into the next millennia. And that was my biggest gift was to stay alive and be able to talk about these technologies and then read about it three months later in the business magazines and then the national science magazines and

things like this. So someone's listening to us, George.

NOORY: Somebody is.

SMITH: And people do want it out. It's just we have to do it in a safe way. And that's why I'm here speaking, because I really want to make a change to help Earth and all the humans on the planet to understand that there is so much hope coming our way that we cannot give up, because we are an amazing race.

NOORY: Emery, thank you for being on "Cosmic Disclosure." You're one of a kind, my friend.

SMITH: Oh, George. Always a pleasure. Thank you so much for having me.

NOORY: I'm George Noory. Thanks for watching.

Clones Among Us Season 12, Episode 30

Cosmic Disclosure; Clones Among Us Season 12, Episode 30

GEORGE NOORY: Welcome to "Cosmic Disclosure." I'm your host, George Noory, and I'm here with Emery Smith.

NOORY: We've all heard about cloning. But what if you or your friend or someone you met is a clone? Would you even know it? Welcome to "Cosmic Disclosure" Emery Smith. Hi, Emery. Good to see you again.

EMERY SMITH: Good to see you, too, George. Thanks for having me.

NOORY: These clones that could be just about anything, all walks of life. They could be ETs. They could be humans that are cloned. What do we know about that?

SMITH: Well, cloning has been done before I even came along. They've been cloning animals for quite a while. And in the hybrid programs that I was associated with, they were cloning not only species, like plants and animals, but they were also regenerating tissues of extraterrestrials and growing them and then cloning them. And then they started cloning humans a very long time ago. It's interesting now that in the news after talking about this a few times that now they're coming forward. China just has been doing it forever but in their underground facilities, cloning people and cloning, of course, you heard about they cloned their first primate. And, hey, if they can clone a primate--that verifies what I'm talking about--well, they can definitely clone a human. And they're are also growing humans for organs. And you know, big controversy behind this. But clones are everywhere. Human, extraterrestrial, they're wandering all over. Some people refer to these as doppelgangers because they can grow a human to look like someone and mind program and implant them with circuitry and things like this, and they will really think they had this life and implant them into a business or into whatever organization they want. And, you know, many times you'll be walking down the street, you'll hear people say on--you could look this up on online--man, this person looks just like me.

NOORY: Sure.

SMITH: Like why is that? How did they get there? And they have no idea that they're probably were part of this cloning program.

NOORY: Well, is there a hidden agenda? Because you've just brought something up that just scares the living daylights out of me. And that is to replace us with a clone and who would know the difference?

SMITH: This is one that probably only times, George, that you got me on a negative part because there is an agenda. There are hundreds and hundreds of people being cloned in underground facilities in Australia and in some parts of the United States. And they're doing this for some reason, which obviously is diabolical, because there's no reason to clone people and keep it a secret and make horrible experiments on these people and mind implant them. The biggest problem they're having is some clones when they pick like the one clone to do an experiment and maybe they'll make 20 of these clones of the one person. And as these clones grow older and they train them, what starts to happen is they start to have memory recall.

NOORY: What if you clone the president and put this clone him in the White House? You put them in Russia, in the Kremlin, and you put them all over the place? And what if there's a company behind it that wants to control and dominate the planet?

SMITH: There is I think a possibility that this could happen. I don't think it's likely that it's happening right now. I think it's more of corporate domination actually that's higher than the president. Do you understand?

NOORY: I get it.

SMITH: So it's more important that these corporations are inserting these clones that are programmed that look like people and having these people unfortunately terminated--they're terminating because you have to terminate someone to replace someone.

NOORY: Who in the heck concocted this kind of scheme? The deep state? Somebody has got be behind this.

SMITH: Yeah, I mean it is this pop culture term, deep state, which for me is just the major corporations that have their own agendas and that may be influenced also by a higher force as well.

NOORY: How long has that been happening? Years?

SMITH: Oh, my goodness, as far as I'm concerned, when I found out about it in 1990--

NOORY: 29 years ago?

SMITH: They must have been doing it at least two decades before that.

NOORY: Jeez. The technology is that advanced?

SMITH: Yes. Yes, it is. They're able to 3D print now individuals and people over a

few months.

NOORY: Now, we're primarily concerned about humans cloning humans for their own purpose.

SMITH: Right.

NOORY: Well, what about ETs cloning humans, and they kind of inject themselves. Is that possible?

SMITH: I mean, it's possible. I'm not aware of any extraterrestrials that are cloning humans. I am aware of extraterrestrial beings that are collecting DNA from humans.

NOORY: That's been ongoing.

SMITH: Ongoing for a good reason, not for a bad reason. You know, they can make anything, too. I mean they are already at an advanced level of science that we would not understand to do that if they needed to.

NOORY: Is a clone, Emery, basically a human being identical to the clone? And so they eat, they sleep, they do everything that a human known does?

SMITH: No. No, because they still have to go through the growing process. And so it's a lot of work.

NOORY: You can't speed that up?

SMITH: Well, they have sped it up. But there's a problem. They can make a George Noory in about eight years, that you're--from baby to you.

NOORY: OK.

SMITH: The problem is the brain cannot grow that fast as the body can. So all your bodily tissues, such as your bones and muscles and tendons and things like anything made of collagen, can be very rapidly accelerated with the technologies they have. And the learning, you know, you can learn pretty quickly. But there seems to be a problem they're having with the brains.

NOORY: What's the agenda? What's the mission here to clone?

SMITH: You know, I don't know that agenda. I can just give you my opinion on it that they would use it for a fear type thing, such as a fake alien invasion, definitely control, like a secret army, you know, a secret group of assassins, things like this that, you know, is very frightful. Just to know that they're doing this on a mass production conveyor belt is horrifying enough. And you know, you have to take care of this

being. You have to feed this being. You have to train this being.

NOORY: It's alive.

SMITH: It's a real person.

NOORY: Yeah.

SMITH: And then like I said, some of them have recall. And then the recall messes up with their psyche. But it's still in the--it's done in the early stages, but it's not always successful, I'll say.

NOORY: What happens to the human soul, Emery, in this kind of situation? Does the clone have a separate soul?

SMITH: I believe that the clone has a separate soul, a separate personality. But it is also linked to its twin, its clone, its other clone, because it's been shown already that when you take DNA in this glass of water and you put this purified water over here that it automatically starts to have the DNA in this glass of water, whether you're shooting laser light through it or using sound frequency. So if you're taking any DNA from anyone, it has a hard drive in this DNA that that DNA is going to recall some things. That's how we sometimes contract illnesses that our grandmothers and grandfathers have. It's in the lineage. It's in the DNA. So what's not to say that the programming that the original person had could easily be in the clone and actually have traits of this person? As far as the soul and spirit, that's still a very confusing thing for me to understand. But these clones do have feelings. They do have emotions. They do have everything a normal person would have. And they have the choice to make a spiritual decision if they wanted to be a religious person or something like this.

NOORY: Do they have the memory of the person they've been cloned? Or do they also have their own?

SMITH: They have their own life experience memory. And most of them, 80% of them have some sort of recall of who they were before.

NOORY: Do they know they're a clone?

SMITH: Well, some do. Some figure it out. Some are actually soldiers of cloning. So they actually are raised for certain missions.

NOORY: I mean if a clone of Emery Smith came in here right now and looked at you, would that clone think he was you?

SMITH: He could possibly think that. I've met two, in the military, two individuals that I was very shocked to have seen face to face because it was definitely me.

NOORY: You looked at yourself?

SMITH: Yeah. And it was very interesting. And people noticed this. And it wasn't something that was deep in the projects. This was on top of working at Kirtland Air Force Base.

NOORY: Interesting.

SMITH: We became kind of friends for a very, very short period of time. And then he disappeared or got relocated. But it was very interesting that people picked up on this and saw the exact similarities. And so there is a possible way that this is happening. But his personality was completely the opposite of mine.

NOORY: Why would there be another cloned you? What was the purpose?

SMITH: I don't know. I don't know if that was also--you know, it's possible the universe, too, with doppelgangers that these people are born on separate parts of the world. And it could be just an energetic thing that they were born at the same time and the same energy and the same alignment with the stars. And, you know, there also is the natural cloning of what I call these doppelgangers you see.

NOORY: Do they want to replace you?

SMITH: I don't believe they're cloning me for any reason whatsoever. I don't have any--

NOORY: Well, I mean if there's two more of you--

SMITH: I don't have any intuition of that. But to see someone that's identical to you is a very startling thing. And this was when I was very, very young, of course, in my early 20s.

NOORY: Can clones mate? Do they have children?

SMITH: A clone is just like when we clone a primate or a pig or a cow. They still have all the same organs, all the same things.

NOORY: The ability to breed.

SMITH: The only thing that's different is some of the clones are implanted and they're using circuitry and biocircuitry to be either maybe sometimes mind controlled or to carry out one-way missions, we call them. Or they're just definitely going to die on

this mission, but they're going to accomplish whatever that agenda is.

NOORY: How many secret labs do you think there are on this planet performing cloning?

SMITH: I know of six. So there's probably--

NOORY: All over the planet?

SMITH: There's probably double that or more.

NOORY: Emery, how prevalent are ET clones?

SMITH: ET clones are very prevalent. That's just something they do. They've been doing it forever. It's kind of interesting how many ET races all look the same.

NOORY: They do. They're remarkable.

SMITH: And it's like, well, why is that? Were they perfecting their super agenda for creating a stronger person maybe? Were they getting DNA, manipulating it, so the human would be the superhuman and we'll all be this amazing super creature that does not get sick, that can live for 500 years--

NOORY: That would be nice.

SMITH: Born with all the technology already built in. So I think there are some races out there that are of the same clone that just because of the bodies I've seen and worked on, it's just too identical.

NOORY: I know twins who are identical. They played games when they were kids. They play games when they're adults. They tried to trick boyfriends and girlfriends. Do these clones have personality like that? I mean, do they play games and have fun?

SMITH: Yeah, I mean, they have this connection, of course, like twins do. I'm glad you brought that up. And I'm very familiar with twins. And I've known a lot of twins. And I've studied this in depth that there is this connection energetically because of the same vibratory frequency. However, their genes and genetic makeup can change. And a good example of this is a recent report of the astronaut who had a twin brother, and he was sent to space and lived in space for however long, came back, they measured the DNA and there was differences in the DNA.

NOORY: It was bizarre.

SMITH: Now that's--how can you change DNA?

NOORY: Different heights and stuff like that.

SMITH: Right. So DNA can be manipulated by electromagnetic fields and radiation and living in different parts of the planet. It could be manipulated, obviously.

NOORY: What's the purpose of cloning unless there's something sinister behind it? I mean, I don't see the logic of why you would want to clone somebody.

SMITH: Well, right now like China is really trying to push this cloning because they want to grow people for their organs because 33 people over there a day die waiting just to get some organ.

NOORY: Can't they just grow the organ without the human?

SMITH: Right. Well, what they're doing is they're trying to find species like pigs who have a very similar--that's why we use pig valves, pig hearts in cardiac surgery. And it has to do with the growth rate of cells, believed or not. So as far as what the agenda is I believe the agenda for the corporate world on top here is to grow people clandestinely and harvest their organs and sell them on the black market or use pigs to grow a human organ and then take that one organ and then put it into the person.

NOORY: Which is a chimera if it has any human parts in it.

SMITH: It's a chimera, that's right. Absolutely.

NOORY: The great baseball great Ted Williams, he died. His family has his head stored away at a cryogenic chamber. And they're hoping one day to be able to clone the body and download the memory from his real brain, which is frozen right now, and plant it into the brain of the clone. And there he is. He's Ted Williams all over again because we are memory. That's what we are.

SMITH: Yeah, we're energy. We're an atomic, crystalline structure that can be rearranged and re-implanted into another living being. That is a kind of a clone that has not been turned on, as we say in the projects. So you might have a body that's fully grown, that's been growing, and still have muscle and can still stand up right off the table after 10 years or 8 years or depending on what it is and implant the memory of a person or--

NOORY: That would be remarkable.

SMITH: Well, they're doing it already.

NOORY: My gosh.

SMITH: Yes. And that's amazing--this is kind of like "Avatar" stuff--

NOORY: It really is--

SMITH: Like in the movie.

NOORY: But there's still something sinister behind this, Emery. I don't see anything positive coming from any of this.

SMITH: I don't agree with it. And I think it's wrong. It just doesn't sit right with me. So I think, you know, there's other ways to do this where we can 3D print our organs. But, you know, they're not letting that technology out. They just recently actually posted something after I spoke about this last year about organ 3D printing. And they printed the ear. They 3D printed an ear. But what they don't tell the people is, well, what matrix did you use to print? They get everyone all excited because the secret is how you do that because you need a lattice. You need a matrix for whatever organ we grow. And I've seen this already many times sure them growing hearts and livers for the elites and people that needed--VIP types of individuals.

NOORY: They get anything they want.

SMITH: And they were using a collagen-based protein structure found in your blood to do this. And they would also sometimes, depending on what part of the body that they were growing, would utilize synthetic materials, which is kind of scary in a way. But then again, we have oseointegration. We've already proven titanium into tissue now. We can 3D print very small sponge-like structures and features in many different types of biocompatible synthetic materials, not just metals, to make a nose or to make--

NOORY: They just grow it right on, don't they?

SMITH: They grow the tissue on. So I'll take a piece of your skin. And I'll 3D print a lattice, a matrix of collagen or a matrix of platelet rich plasma and activate that.

NOORY: Inject the cells.

SMITH: Inject the cells there. And we grow it and then we can put it right on.

NOORY: And they have a new nose or whatever.

SMITH: New nose.

NOORY: If a clone breeds with a clone, what is the offspring? A clone?

SMITH: Well, that's a good question, because if you think about it, was that clone,

number one, did it have any lineage from the other clone? Because male and female, you have to look at it that way. Where did this clone come from? What lineage of DNA? And, of course, that's like families shouldn't reproduce together because it creates anomalies.

NOORY: Right, absolutely.

SMITH: And, you know, I don't know why would they do that. But, yeah, it's definitely possible. They have all the sexual organs to procreate.

NOORY: They're fully function.

SMITH: They're fully functional beings. The question is, in a project, if they were to do that, they were probably trying to make some super race or being. That's the only reason to do that.

NOORY: Can you imagine what Hitler would have done with this technology if he had perfected it? He would abused it.

SMITH: Yeah, that's a scary thought.

NOORY: Really. Yeah, I mean, so how do we know ETs aren't doing the same kind of abuse?

SMITH: Well, Germany had a lot of experience with extraterrestrials. And you know, I do believe that they met with them. And I know Hitler probably knew about some of these things. But they had to keep it a secret. And they were not allowed to use it in war was the deal from what I heard through second hand information. So that was a very interesting thing to realize that he had technology and did not use it against us in war and against Europe. But who's not to say he did not use it on himself? And on his closer confidants around him?

NOORY: He's cloned somewhere. That's just what we need, right? And some of these people want to live forever. You know, these multi-billionaires, if they have the ability to do what we talked about earlier--download memory, download memory into cloned bodies. They get a brand new body every 20 years.

SMITH: Yes, and imagine if they had the hair strand from Marilyn Monroe or--

NOORY: Or anybody or John Kennedy.

SMITH: Or anyone, right. I mean, they can easily reproduce a clone just from that genetic--just from that small amount of DNA.

NOORY: You've got a scientific background. Have you been involved in any cloning practices?

SMITH: I have not directly, only indirectly been part of these projects. And I'm only aware of it because I was in the same area where they were cloning plants, animals, extraterrestrials, and mixing these things. It wasn't until later on I found out through my secondary people and also through the special library, I call it, of learning how they do it and that they're very successful with it.

NOORY: I still don't understand the reason for cloning I mean, outside of the organs I understand. But you're killing a body, a human, to take his liver, to take his kidneys, to take his heart. I don't agree with that. I think that's horrible. There seems to be a bigger picture here. What am I missing?

SMITH: Well, I think they are, you know, diabolically trying to create some sort of army or something. And don't forget, they can clone all sorts of weird scary things, not just humans, and to use that against us in some sort of control method or control fashion. And not to talk like a conspiracy theorist, my opinion is I cannot, like you cannot, figure out any other agenda. You know, why would they want to replace--release 100,000 clones into the general public to create what?

NOORY: There's an agenda somewhere. There's a hidden agenda--

SMITH: There's something going on--

NOORY: To do something. You know, maybe they're all going to be like Manchurian candidates. So at any given point, they can hit a button and they all do everything that you want them to do.

SMITH: Yeah. They use cloning too in exercises as well.

NOORY: What do you mean?

SMITH: Well, they have huge underground facilities in cities that mimic different types of cities and countries around the world. And they use cloning type people that are implanted with memories to test biological warfare systems, to test weapons of different types of scalar frequency weapons.

NOORY: Maybe they can survive some kind of catastrophe.

SMITH: Right. So it's also to see how the public would respond to a catastrophe in one area we'll say, let's say Washington DC. And so we'll have a mock setup better than Hollywood. And people would basically just wake up on a bench or wake up in their home and already knowing that they have to go to work today or they have a

premeditated--they really believe that they maybe just fell asleep reading the paper.

NOORY: Right. Exactly.

SMITH: And then a catastrophe happens of some sort or an outbreak, a viral outbreak, let's say. And then they want to see how the people react. And also, they want to record this because they will sell this information to other corporations, these terrible weapons, and say, look at what we can do. We did a mockup. And this is what happened. So we'll sell it to this country and turn around and sell it to this terrorist group. And I've seen these places.

NOORY: Do you think these clones, Emery, have already been put into society? They've been mixed in with us already?

SMITH: I 100% believe definitely there's clones walking around that do not know they're clones and that are put into positions that for whatever agenda--

NOORY: And what happened to that actual human that the clone has replaced?

SMITH: Well, if they're replacing someone, well it's usually probably that person is terminated or maybe that person is going to have--

NOORY: A little disappearance.

SMITH: Yeah, a little disappearance or something. But there's also clones that are just wandering around, that are working individuals that--

NOORY: So there could be--

SMITH: Did not have an agenda--

NOORY: There could be two of me. Me and the clone somewhere. Maybe they put him in England or something.

SMITH: Sure. Right.

NOORY: But who's they?

SMITH: I always fall back on the only one that has the power and the money to do this are these really megalethargic corporations, you know, like these top 10 corporations from around the planet that get all the goodies. They have the best technology because they get everything from the extraterrestrials. They always get it first.

NOORY: Sure.

SMITH: And whether they put to good use, it's very rare. But a lot of--all of our advancements in technology comes from these corporations. So I look at it in a positive way as well, because a lot of the stuff we use in surgery to save people's lives--you know, we use them in firetrucks. We use them in the police departments and things that prolong our life. It's just--

NOORY: Do the clones, Emery, have their own personality? I mean do they act on their own?

SMITH: Yeah. Depending on what the agenda is for that clone or why that clone was made or how that clone was raised, the clone could have been implanted into a family when he was three and just kind of raised into a normal life.

NOORY: And he grew up like a human being.

SMITH: Grew up like a human being and guided into a certain position, I'll say, in a government to do something and then later on maybe was told that they are a clone or maybe not. So everyone can have their own personality. But not everyone is. And some clones, like I told you, can be mind controlled. They could be placed into the family and then later on activated, like the Manchurian Candidate kind of situation. And then all of a sudden--

NOORY: To do something.

SMITH: This person just flipped for no reason, killed a bunch of people, has no idea why they did it, but they did it. And now they're in jail--

NOORY: Sure.

SMITH: And a lot of these things are like this. Wars are started over because they think someone stole something from them or did something to their family member or, you know--

NOORY: Some are calling for that Chinese cloner to be arrested. What do you think?

SMITH: Well, I'm not here to judge. I can just tell you my opinion. I think it needs to be revisited. And I think more scientists and universities need to get involved. And the United Nations needs to get involved. And let's say what's ethically--you know, what's the right ethically thing to do for this? Because when you start going rogue, this is where things can get out of hand. And you have to prove to the people of the planet and the leaders why is this a positive thing and what does it serve the general population. That's why I always tell everyone, you know, when people were asking me questions about all sorts of personality things, it's like, well, how is that going to serve everyone else? How is that going to serve the planet? Are we cloning humpback

whales because we need to, at a later date, be able to grow them because there's not going to be any left. As far as humans are concerned, that's a very delicate thing, because what about the spirit? What about the soul? What about--are you growing this person in stasis until they're a certain age and not waking them up and keeping them in a coma so that they don't really have a life? Are you grow--are you growing this clone without a brain? Are you just utilizing the scaffolding of a tissue? There's so many questions to be answered, that the general public and the leaders of the world need to look at this person and maybe guide it into a different direction. We need to really wait for the science to come forward and think about what's ethical and how do we use this beneficially to preserve.

NOORY: Emery, thanks for being on "Cosmic Disclosure." Really appreciate it.

SMITH: Thanks for having me, George.

NOORY: I'm George Noory. Thanks for watching.
